16.4.9 Implementation: ISR endpoint mapping

Similar to the endpoint mapping above: This maps the unit square (r_1, r_2) such that p_1 is the product $r_1 r_2$, while p_2 is related to the ratio. Furthermore, we enhance the region at $r_1 = 1$ and $r_2 = 1$, which translates into $p_1 = 1$ and $p_2 = 0, 1$.

The enhancement is such that ISR singularity $(1 - x)^{-1+\epsilon}$ is flattened. This would be easy in one dimension, but becomes nontrivial in two dimensions.

```

<SF mappings: public>+≡

16.4.13 Implementation: Endpoint + ISR + resonance

This is a combination of endpoint (i.e., beamstrahlung) and ISR power mapping, adapted for an s-channel resonance. The first two internal parameters apply to the beamstrahlung spectrum, the last two to the ISR function for the first and second beam, respectively. The first and third parameters are the result of an overall resonance mapping, so on the outside, the first parameter is the total momentum fraction, the third one describes the distribution between beamstrahlung and ISR.

16.4.15 Basic formulas

Standard mapping of the unit square

This mapping of the unit square is appropriate in particular for structure functions which are concentrated at the lower end. Instead of a rectangular grid, one set of grid lines corresponds to constant parton c.m. energy. The other set is chosen such that the jacobian is only mildly singular ($\ln x$ which is zero at $x = 1$), corresponding to an initial concentration of sampling points at the maximum energy. If **power** is greater than one (the default), points are also concentrated at the lower end.

The formula is (**power**= α):

$$r_1 = (p_1^{p_2})^\alpha \quad (16.15)$$

$$r_2 = (p_1^{1-p_2})^\alpha \quad (16.16)$$

$$f = \alpha^2 p_1^{\alpha-1} |\log p_1| \quad (16.17)$$

and for the default case $\alpha = 1$:

$$r_1 = p_1^{p_2} \quad (16.18)$$

$$r_2 = p_1^{1-p_2} \quad (16.19)$$

$$f = |\log p_1| \quad (16.20)$$

(SF mappings: procedures) +=

```
subroutine map_unit_square (r, factor, p, power)
  real(default), dimension(2), intent(out) :: r
  real(default), intent(out) :: factor
  real(default), dimension(2), intent(in) :: p
  real(default), intent(in), optional :: power
  real(default) :: xx, yy
  factor = 1
  xx = p(1)
  yy = p(2)
  if (present(power)) then
    if (p(1) > 0 .and. power > 1) then
      xx = p(1)**power
      factor = factor * power * xx / p(1)
    end if
  end if
  if (xx /= 0) then
    r(1) = xx ** yy
    r(2) = xx / r(1)
    factor = factor * abs (log (xx))
  else
    r = 0
  end if
end subroutine map_unit_square
```

This is the inverse mapping.

(SF mappings: procedures) +=

```
subroutine map_unit_square_inverse (r, factor, p, power)
  real(kind=default), dimension(2), intent(in) :: r
```

```

real(kind=default), intent(out) :: factor
real(kind=default), dimension(2), intent(out) :: p
real(kind=default), intent(in), optional :: power
real(kind=default) :: lg, xx, yy
factor = 1
xx = r(1) * r(2)
if (xx /= 0) then
  lg = log (xx)
  if (lg /= 0) then
    yy = log (r(1)) / lg
  else
    yy = 0
  end if
  p(2) = yy
  factor = factor * abs (lg)
  if (present(power)) then
    p(1) = xx**(1._default/power)
    factor = factor * power * xx / p(1)
  else
    p(1) = xx
  end if
else
  p = 0
end if
end subroutine map_unit_square_inverse

```

Precise mapping of the unit square

A more precise version (with unit power parameter). This version should be numerically stable near $x = 1$ and $y = 0, 1$. The formulas are again

$$r_1 = p_1^{p_2}, \quad r_2 = p_1^{\bar{p}_2}, \quad f = -\log p_1 \quad (16.21)$$

but we compute both r_i and \bar{r}_i simultaneously and make direct use of both p_i and \bar{p}_i as appropriate.

(SF mappings: procedures)+≡

```

subroutine map_unit_square_prec (r, rb, factor, p, pb)
  real(default), dimension(2), intent(out) :: r
  real(default), dimension(2), intent(out) :: rb
  real(default), intent(out) :: factor
  real(default), dimension(2), intent(in) :: p
  real(default), dimension(2), intent(in) :: pb
  if (p(1) > 0.5_default) then
    call compute_prec_xy_1 (r(1), rb(1), p(1), pb(1), p (2))
    call compute_prec_xy_1 (r(2), rb(2), p(1), pb(1), pb(2))
    factor = - log_prec (p(1), pb(1))
  else if (p(1) > 0) then
    call compute_prec_xy_0 (r(1), rb(1), p(1), pb(1), p (2))
    call compute_prec_xy_0 (r(2), rb(2), p(1), pb(1), pb(2))
    factor = - log_prec (p(1), pb(1))
  else
    r = 0
    rb = 1
  end if
end subroutine map_unit_square_prec

```

```

        factor = 0
    end if
end subroutine map_unit_square_prec

```

This is the inverse mapping.

(SF mappings: procedures)+≡

```

subroutine map_unit_square_inverse_prec (r, rb, factor, p, pb)
    real(default), dimension(2), intent(in) :: r
    real(default), dimension(2), intent(in) :: rb
    real(default), intent(out) :: factor
    real(default), dimension(2), intent(out) :: p
    real(default), dimension(2), intent(out) :: pb
    call inverse_prec_x (r, rb, p(1), pb(1))
    if (all (r > 0)) then
        if (rb(1) < rb(2)) then
            call inverse_prec_y (r, rb, p(2), pb(2))
        else
            call inverse_prec_y ([r(2),r(1)], [rb(2),rb(1)], pb(2), p(2))
        end if
        factor = - log_prec (p(1), pb(1))
    else
        p(1) = 0
        pb(1) = 1
        p(2) = 0.5_default
        pb(2) = 0.5_default
        factor = 0
    end if
end subroutine map_unit_square_inverse_prec

```

This is an auxiliary function: evaluate the expression $\bar{z} = 1 - x^y$ in a numerically stable way. Instabilities occur for $y = 0$ and $x = 1$. The idea is to replace the bracket by the first terms of its Taylor expansion around $x = 1$ (read $\bar{x} \equiv 1 - x$)

$$1 - x^y = y\bar{x} \left(1 + \frac{1}{2}(1 - y)\bar{x} + \frac{1}{6}(2 - y)(1 - y)\bar{x}^2 \right) \quad (16.22)$$

whenever this is the better approximation. Actually, the relative numerical error of the exact formula is about $\eta/(y\bar{x})$ where η is given by `epsilon(KIND)` in Fortran. The relative error of the approximation is better than the last included term divided by $(y\bar{x})$.

The first subroutine computes z and \bar{z} near $x = 1$ where $\log x$ should be expanded, the second one near $x = 0$ where $\log x$ can be kept.

(SF mappings: procedures)+≡

```

  real(default) :: a1, a2, a3, lx
  lx = -log (x)
  a1 = y * lx
  a2 = a1 * y * lx / 2
  a3 = a2 * y * lx / 3
  if (abs (a3) < epsilon (a3)) then
    zb = a1 + a2 + a3
    z = 1 - zb
  else
    z = x ** y
    zb = 1 - z
  end if
end subroutine compute_prec_xy_0

```

For the inverse calculation, we evaluate $x = r_1 r_2$ in a stable way. Since it is just a polynomial, the expansion near $x = 1$ is analytically exact, and we don't need to choose based on precision.

(SF mappings: procedures) +≡

```

subroutine inverse_prec_x (r, rb, x, xb)
  real(default), dimension(2), intent(in) :: r, rb
  real(default), intent(out) :: x, xb
  real(default) :: a0, a1
  a0 = rb(1) + rb(2)
  a1 = rb(1) * rb(2)
  if (a0 > 0.5_default) then
    xb = a0 - a1
    x = 1 - xb
  else
    x = r(1) * r(2)
    xb = 1 - x
  end if
end subroutine inverse_prec_x

```

The inverse calculation for the relative momentum fraction

$$y = \frac{1}{1 + \frac{\log r_2}{\log r_1}} \quad (16.23)$$

is slightly more complicated. We should take the precise form of the logarithm, so we are safe near $r_i = 1$. A series expansion is required if $r_1 \ll r_2$, since then y becomes small. (We assume $r_1 < r_2$ here; for the opposite case, the arguments can be exchanged.)

(SF mappings: procedures) +≡

```

subroutine inverse_prec_y (r, rb, y, yb)

```

```

real(default), dimension(2), intent(in) :: r, rb
real(default), intent(out) :: y, yb
real(default) :: log1, log2, a1, a2, a3
log1 = log_prec (r(1), rb(1))
log2 = log_prec (r(2), rb(2))
a1 = - rb(1) / log2
a2 = - rb(1) ** 2 * (1 / log2**2 + 1 / (2 * log2))
a3 = - rb(1) ** 3 * (1 / log2**3 + 1 / log2**2 + 1 / (3 * log2))
if (abs (a3) < epsilon (a3)) then
  y = a1 + a2 + a3
  yb = 1 - y
else
  y = 1 / (1 + log2/log1)
  yb = 1 / (1 + log1/log2)
end if
end subroutine inverse_prec_y

```

We also need an evaluation of $\log x$ which is stable near $x = 1$.

```

<SF mappings: public>+≡
public :: log_prec

<SF mappings: procedures>+≡
function log_prec (x, xb) result (lx)
  real(default), intent(in) :: x, xb
  real(default) :: a1, a2, a3, lx
  a1 = xb
  a2 = a1 * xb / 2
  a3 = a2 * xb * 2 / 3
  if (abs (a3) < epsilon (a3)) then
    lx = - a1 - a2 - a3
  else
    lx = log (x)
  end if
end function log_prec

```

Mapping for on-shell s-channel

The limiting case, if the product $r_1 r_2$ is fixed for on-shell production. The parameter p_1 is ignored. In the inverse mapping, it is returned zero.

The parameter `x_free`, if present, rescales the total energy. If it is less than one, the rescaled mass parameter m^2 should be increased accordingly.

```

<SF mappings: procedures>+≡
subroutine map_on_shell (r, factor, p, lm2, x_free)
  real(default), dimension(2), intent(out) :: r
  real(default), intent(out) :: factor
  real(default), dimension(2), intent(in) :: p
  real(default), intent(in) :: lm2
  real(default), intent(in), optional :: x_free
  real(default) :: lx
  lx = lm2; if (present (x_free)) lx = lx + log (x_free)
  r(1) = exp (- p(2) * lx)
  r(2) = exp (- (1 - p(2)) * lx)

```

```

        factor = lx
    end subroutine map_on_shell

    subroutine map_on_shell_inverse (r, factor, p, lm2, x_free)
        real(default), dimension(2), intent(in) :: r
        real(default), intent(out) :: factor
        real(default), dimension(2), intent(out) :: p
        real(default), intent(in) :: lm2
        real(default), intent(in), optional :: x_free
        real(default) :: lx
        lx = lm2; if (present (x_free)) lx = lx + log (x_free)
        p(1) = 0
        p(2) = abs (log (r(1))) / lx
        factor = lx
    end subroutine map_on_shell_inverse

```

This is the standard Breit-Wigner mapping. We apply it to a single variable, independently of or in addition to a unit-square mapping. We assume here that the limits for the variable are 0 and 1, and that the mass m and width w are rescaled appropriately, so they are dimensionless and usually between 0 and 1.

If `x_free` is set, it rescales the total energy and thus mass and width, since these are defined with respect to the total energy.

(SF mappings: procedures)+≡

```

    subroutine map_breit_wigner (r, factor, p, m, w, x_free)
        real(default), intent(out) :: r
        real(default), intent(out) :: factor
        real(default), intent(in) :: p
        real(default), intent(in) :: m
        real(default), intent(in) :: w
        real(default), intent(in), optional :: x_free
        real(default) :: m2, mw, a1, a2, a3, z, tmp
        m2 = m ** 2
        mw = m * w
        if (present (x_free)) then
            m2 = m2 / x_free
            mw = mw / x_free
        end if
        a1 = atan (- m2 / mw)
        a2 = atan ((1 - m2) / mw)
        a3 = (a2 - a1) * mw
        z = (1-p) * a1 + p * a2
        if (-pi/2 < z .and. z < pi/2) then
            tmp = tan (z)
            r = max (m2 + mw * tmp, 0._default)
            factor = a3 * (1 + tmp ** 2)
        else
            r = 0
            factor = 0
        end if
    end subroutine map_breit_wigner

    subroutine map_breit_wigner_inverse (r, factor, p, m, w, x_free)

a3 = (a2 - a1) * mw
tmp = (r - m2) / mw
p = (atan (tmp) - a1) / (a2 - a1)
factor = a3 * (1 + tmp ** 2)
end subroutine map_breit_wigner_inverse

```

Mapping with endpoint enhancement

This is a mapping which is close to the unit mapping, except that at the endpoint(s), the output values are exponentially enhanced.

$$y = \tanh(a \tan(\frac{\pi}{2}x)) \quad (16.24)$$

We have two variants: one covers endpoints at 0 and 1 symmetrically, while the other one (which essentially maps one-half of the range), covers only the endpoint at 1.

(SF mappings: procedures)+≡

```

subroutine map_endpoint_1 (x3, factor, x1, a)
  real(default), intent(out) :: x3, factor
  real(default), intent(in) :: x1
  real(default), intent(in) :: a
  real(default) :: x2
  if (abs (x1) < 1) then
    x2 = tan (x1 * pi / 2)
    x3 = tanh (a * x2)
    factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
  else
    x3 = x1
    factor = 0
  end if
end subroutine map_endpoint_1

subroutine map_endpoint_inverse_1 (x3, factor, x1, a)
  real(default), intent(in) :: x3
  real(default), intent(out) :: x1, factor
  real(default), intent(in) :: a
  real(default) :: x2
  if (abs (x3) < 1) then

```

```

        x2 = atanh (x3) / a
        x1 = 2 / pi * atan (x2)
        factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
    else
        x1 = x3
        factor = 0
    end if
end subroutine map_endpoint_inverse_1

subroutine map_endpoint_01 (x4, factor, x0, a)
    real(default), intent(out) :: x4, factor
    real(default), intent(in) :: x0
    real(default), intent(in) :: a
    real(default) :: x1, x3
    x1 = 2 * x0 - 1
    call map_endpoint_1 (x3, factor, x1, a)
    x4 = (x3 + 1) / 2
end subroutine map_endpoint_01

subroutine map_endpoint_inverse_01 (x4, factor, x0, a)
    real(default), intent(in) :: x4
    real(default), intent(out) :: x0, factor
    real(default), intent(in) :: a
    real(default) :: x1, x3
    x3 = 2 * x4 - 1
    call map_endpoint_inverse_1 (x3, factor, x1, a)
    x0 = (x1 + 1) / 2
end subroutine map_endpoint_inverse_01

```

Mapping with endpoint enhancement (ISR)

This is another endpoint mapping. It is designed to flatten the ISR singularity which is of power type at $x = 1$, i.e., if

$$\sigma = \int_0^1 dx f(x) G(x) = \int_0^1 dx \epsilon (1-x)^{-1+\epsilon} G(x), \quad (16.25)$$

we replace this by

$$r = x^\epsilon \implies \sigma = \int_0^1 dr G(1 - (1-r)^{1/\epsilon}). \quad (16.26)$$

We expect that ϵ is small.

The actual mapping is $r \rightarrow x$ (so x emerges closer to 1). The Jacobian that we return is thus $1/f(x)$. We compute the mapping in terms of $\bar{x} \equiv 1 - x$, so we can achieve the required precision. Because some compilers show quite wild numeric fluctuations, we internally convert numeric types to explicit `double` precision.

```

⟨SF mappings: public⟩+≡
    public :: map_power_1
    public :: map_power_inverse_1

```

```

<SF mappings: procedures>+≡
subroutine map_power_1 (xb, factor, rb, eps)
  real(default), intent(out) :: xb, factor
  real(default), intent(in) :: rb
  real(double) :: rb_db, factor_db, eps_db, xb_db
  real(default), intent(in) :: eps
  rb_db = real (rb, kind=double)
  eps_db = real (eps, kind=double)
  xb_db = rb_db ** (1 / eps_db)
  if (rb_db > 0) then
    factor_db = xb_db / rb_db / eps_db
    factor = real (factor_db, kind=default)
  else
    factor = 0
  end if
  xb = real (xb_db, kind=default)
end subroutine map_power_1

subroutine map_power_inverse_1 (xb, factor, rb, eps)
  real(default), intent(in) :: xb
  real(default), intent(out) :: rb, factor
  real(double) :: xb_db, factor_db, eps_db, rb_db
  real(default), intent(in) :: eps
  xb_db = real (xb, kind=double)
  eps_db = real (eps, kind=double)
  rb_db = xb_db ** eps_db
  if (xb_db > 0) then
    factor_db = xb_db / rb_db / eps_db
    factor = real (factor_db, kind=default)
  else
    factor = 0
  end if
  rb = real (rb_db, kind=default)
end subroutine map_power_inverse_1

```

Here we apply a power mapping to both endpoints. We divide the interval in two equal halves and apply the power mapping for the nearest endpoint, either 0 or 1.

```

<SF mappings: procedures>+≡
subroutine map_power_01 (y, yb, factor, r, eps)

        r = 1 - ub / 2
    else if (zp < zm) then
        call map_power_inverse_1 (zp, factor, ub, eps)
        r = ub / 2
    else
        factor = 1 / eps
        ub = 1
        r = ub / 2
    end if
end subroutine map_power_inverse_01

```

Structure-function channels

A structure-function chain parameterization (channel) may contain a mapping that applies to multiple structure functions. This is described by an extension of the `sf_mapping_t` type. In addition, it may contain mappings that apply to (other) individual structure functions. The details of these mappings are implementation-specific.

The `sf_channel_t` type combines this information. It contains an array of map codes, one for each structure-function entry. The code values are:

none MC input parameters r directly become energy fractions x

single default mapping for a single structure-function entry

multi/s map $r \rightarrow x$ such that one MC input parameter is \hat{s}/s

multi/resonance as before, adapted to s-channel resonance

multi/on-shell as before, adapted to an on-shell particle in the s channel

multi/endpoint like multi/s, but enhance the region near $r_i = 1$

multi/endpoint/res endpoint mapping with resonance

multi/endpoint/os endpoint mapping for on-shell

multi/power/os like multi/endpoint, regulating a power singularity

```

⟨SF mappings: parameters⟩≡
  integer, parameter :: SFMAP_NONE = 0
  integer, parameter :: SFMAP_SINGLE = 1
  integer, parameter :: SFMAP_MULTI_S = 2
  integer, parameter :: SFMAP_MULTI_RES = 3
  integer, parameter :: SFMAP_MULTI_ONS = 4
  integer, parameter :: SFMAP_MULTI_EP = 5
  integer, parameter :: SFMAP_MULTI_EPR = 6
  integer, parameter :: SFMAP_MULTI_EPO = 7
  integer, parameter :: SFMAP_MULTI_IP = 8
  integer, parameter :: SFMAP_MULTI_IPR = 9
  integer, parameter :: SFMAP_MULTI_IPO = 10
  integer, parameter :: SFMAP_MULTI_EI = 11

```

Then, it contains an allocatable entry for the multi mapping. This entry holds the MC-parameter indices on which the mapping applies (there may be more than one MC parameter per structure-function entry) and any parameters associated with the mapping.

There can be only one multi-mapping per channel.

```

⟨SF mappings: public⟩+≡
  public :: sf_channel_t

⟨SF mappings: types⟩+≡
  type :: sf_channel_t

write (u, "(A)")  "*" Test output end: sf_mappings_3"

end subroutine sf_mappings_3

```

Check on-shell mapping

Probe the on-shell mapping of the unit square for different parameter values. Also calculates integrals. In this case, the Jacobian is constant and given by $|\log m^2|$, so this is also the value of the integral. The factor results from the variable change in the $\delta(m^2 - x_1 x_2)$ which multiplies the cross section for the case at hand.

For the test, the (rescaled) resonance mass is set at $1/2$ the energy.

```

<SF mappings: execute tests>+≡

```

16.5.1 Abstract structure-function data type

This type should hold all configuration data for a specific type of structure function. The base object is empty; the implementations will fill it.

```

<SF base: public>≡
    public :: sf_data_t

<SF base: types>≡
    type, abstract :: sf_data_t
    contains
    <SF base: sf data: TBP>
    end type sf_data_t

```

Output.

```

<SF base: sf data: TBP>≡
    procedure (sf_data_write), deferred :: write

<SF base: interfaces>≡
    abstract interface
        subroutine sf_data_write (data, unit, verbose)
            import
            class(sf_data_t), intent(in) :: data
            integer, intent(in), optional :: unit
            logical, intent(in), optional :: verbose
        end subroutine sf_data_write
    end interface

```

Return true if this structure function is in generator mode. In that case, all parameters are free, otherwise bound. (We do not support mixed cases.) Default is: no generator.

```

<SF base: sf data: TBP>+≡

```

```

    procedure :: is_generator => sf_data_is_generator
  <SF base: procedures>+=
    function sf_data_is_generator (data) result (flag)
      class(sf_data_t), intent(in) :: data
      logical :: flag
      flag = .false.
    end function sf_data_is_generator

```

Return the number of input parameters that determine the structure function.

```

  <SF base: sf data: TBP>+=
    procedure (sf_data_get_int), deferred :: get_n_par
  <SF base: interfaces>+=
    abstract interface
      function sf_data_get_int (data) result (n)
        import
        class(sf_data_t), intent(in) :: data
        integer :: n
      end function sf_data_get_int
    end interface

```

Return the outgoing particle PDG codes for the current setup. The codes can be an array of particles, for each beam.

```

  <SF base: sf data: TBP>+=
    procedure (sf_data_get_pdg_out), deferred :: get_pdg_out
  <SF base: interfaces>+=
    abstract interface
      subroutine sf_data_get_pdg_out (data, pdg_out)
        import
        class(sf_data_t), intent(in) :: data
        type(pdg_array_t), dimension(:), intent(inout) :: pdg_out
      end subroutine sf_data_get_pdg_out
    end interface

```

Allocate a matching structure function interaction object and properly initialize it.

```

  <SF base: sf data: TBP>+=
    procedure (sf_data_allocate_sf_int), deferred :: allocate_sf_int
  <SF base: interfaces>+=
    abstract interface
      subroutine sf_data_allocate_sf_int (data, sf_int)
        import
        class(sf_data_t), intent(in) :: data
        class(sf_int_t), intent(inout), allocatable :: sf_int
      end subroutine sf_data_allocate_sf_int
    end interface

```

Return the PDF set index, if applicable. We implement a default method which returns zero. The PDF (builtin and LHA) implementations will override this.

```

  <SF base: sf data: TBP>+=
    procedure :: get_pdf_set => sf_data_get_pdf_set

```

```

<SF base: procedures>+=
function sf_data_get_pdf_set (data) result (pdf_set)
  class(sf_data_t), intent(in) :: data
  integer :: pdf_set
  pdf_set = 0
end function sf_data_get_pdf_set

```

16.5.2 Structure-function chain configuration

This is the data type that the `processes` module uses for setting up its structure-function chain. For each structure function described by the beam data, there is an entry. The `i` array indicates the beam(s) to which this structure function applies, and the `data` object contains the actual configuration data.

```

<SF base: public>+=
public :: sf_config_t

<SF base: types>+=
type :: sf_config_t
  integer, dimension(:), allocatable :: i
  class(sf_data_t), allocatable :: data
contains
  <SF base: sf config: TBP>
end type sf_config_t

```

Output:

```

<SF base: sf config: TBP>=
procedure :: write => sf_config_write

<SF base: procedures>+=
subroutine sf_config_write (object, unit)
  class(sf_config_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  if (allocated (object%i)) then
    write (u, "(1x,A,2(1x,I0))") "Structure-function configuration: &
      &beam(s)", object%i
    if (allocated (object%data)) call object%data%write (u)
  else
    write (u, "(1x,A)") "Structure-function configuration: [undefined]"
  end if
end subroutine sf_config_write

```

Initialize.

```

<SF base: sf config: TBP>+=
procedure :: init => sf_config_init

<SF base: procedures>+=
subroutine sf_config_init (sf_config, i_beam, sf_data)
  class(sf_config_t), intent(out) :: sf_config
  integer, dimension(:), intent(in) :: i_beam
  class(sf_data_t), intent(in) :: sf_data

```

```

        allocate (sf_config%i (size (i_beam)), source = i_beam)
        allocate (sf_config%data, source = sf_data)
    end subroutine sf_config_init

```

Return the PDF set, if any.

```

⟨SF base: sf config: TBP⟩+≡
    procedure :: get_pdf_set => sf_config_get_pdf_set

⟨SF base: procedures⟩+≡
    function sf_config_get_pdf_set (sf_config) result (pdf_set)
        class(sf_config_t), intent(in) :: sf_config
        integer :: pdf_set
        pdf_set = sf_config%data%get_pdf_set ()
    end function sf_config_get_pdf_set

```

16.5.3 Structure-function instance

The `sf_int_t` data type contains an `interaction_t` object (it is an extension of this type) and a pointer to the `sf_data_t` configuration data. This interaction, or copies of it, is used to implement structure-function kinematics and dynamics in the context of process evaluation.

The status code `status` tells whether the interaction is undefined, has defined kinematics (but matrix elements invalid), or is completely defined. There is also a status code for failure. The implementation is responsible for updating the status.

The entries `mi2`, `mr2`, and `mo2` hold the squared invariant masses of the incoming, radiated, and outgoing particle, respectively. They are supposed to be set upon initialization, but could also be varied event by event.

If the radiated or outgoing mass is nonzero, we may need to apply an on-shell projection. The projection mode is stored as `on_shell_mode`.

The array `beam_index` is the list of beams on which this structure function applies (1, 2, or both). The arrays `incoming`, `radiated`, and `outgoing` contain the indices of the respective particle sets within the interaction, for convenient lookup. The array `par_index` indicates the MC input parameters that this entry will use up in the structure-function chain. The first parameter (or the first two, for a spectrum) in this array determines the momentum fraction and is thus subject to global mappings.

In the abstract base type, we do not implement the data pointer. This allows us to restrict its type in the implementations.

```

⟨SF base: public⟩+≡
    public :: sf_int_t

⟨SF base: types⟩+≡
    type, abstract, extends (interaction_t) :: sf_int_t
        integer :: status = SF_UNDEFINED
        real(default), dimension(:), allocatable :: mi2
        real(default), dimension(:), allocatable :: mr2
        real(default), dimension(:), allocatable :: mo2
        integer :: on_shell_mode = KEEP_ENERGY
        logical :: qmin_defined = .false.
        logical :: qmax_defined = .false.

```

```

real(default), dimension(:), allocatable :: qmin
real(default), dimension(:), allocatable :: qmax
integer, dimension(:), allocatable :: beam_index
integer, dimension(:), allocatable :: incoming
integer, dimension(:), allocatable :: radiated
integer, dimension(:), allocatable :: outgoing
integer, dimension(:), allocatable :: par_index
integer, dimension(:), allocatable :: par_primary
contains
  <SF base: sf_int: TBP>
end type sf_int_t

```

Status codes. The codes that refer to links, masks, and connections, apply to structure-function chains only.

The status codes are public.

```

<SF base: parameters>≡
integer, parameter, public :: SF_UNDEFINED = 0
integer, parameter, public :: SF_INITIAL = 1
integer, parameter, public :: SF_DONE_LINKS = 2
integer, parameter, public :: SF_FAILED_MASK = 3
integer, parameter, public :: SF_DONE_MASK = 4
integer, parameter, public :: SF_FAILED_CONNECTIONS = 5
integer, parameter, public :: SF_DONE_CONNECTIONS = 6
integer, parameter, public :: SF_SEED_KINEMATICS = 10
integer, parameter, public :: SF_FAILED_KINEMATICS = 11
integer, parameter, public :: SF_DONE_KINEMATICS = 12
integer, parameter, public :: SF_FAILED_EVALUATION = 13
integer, parameter, public :: SF_EVALUATED = 20

```

Write a string version of the status code:

```

<SF base: procedures>+≡
subroutine write_sf_status (status, u)
integer, intent(in) :: status
integer, intent(in) :: u
select case (status)
case (SF_UNDEFINED)
write (u, "(1x,'[',A,']')") "undefined"
case (SF_INITIAL)
write (u, "(1x,'[',A,']')") "initialized"
case (SF_DONE_LINKS)
write (u, "(1x,'[',A,']')") "links set"
case (SF_FAILED_MASK)
write (u, "(1x,'[',A,']')") "mask mismatch"
case (SF_DONE_MASK)
write (u, "(1x,'[',A,']')") "mask set"
case (SF_FAILED_CONNECTIONS)
write (u, "(1x,'[',A,']')") "connections failed"
case (SF_DONE_CONNECTIONS)
write (u, "(1x,'[',A,']')") "connections set"
case (SF_SEED_KINEMATICS)
write (u, "(1x,'[',A,']')") "incoming momenta set"
case (SF_FAILED_KINEMATICS)
write (u, "(1x,'[',A,']')") "kinematics failed"

```

```

case (SF_DONE_KINEMATICS)
  write (u, "(1x,['',A,''])" "kinematics set"
case (SF_FAILED_EVALUATION)
  write (u, "(1x,['',A,''])" "evaluation failed"
case (SF_EVALUATED)
  write (u, "(1x,['',A,''])" "evaluated"
end select
end subroutine write_sf_status

```

Finalizer. Required because the base interaction needs a finalizer. We provide an implementation, which need not be overwritten if the implementation does not add finalizable subobjects.

```

<SF base: sf int: TBP>≡
  procedure :: final => sf_int_final
<SF base: procedures>+≡
  subroutine sf_int_final (object)
    class(sf_int_t), intent(inout) :: object
    call interaction_final (object%interaction_t)
  end subroutine sf_int_final

```

This is the basic output routine. Display status and interaction.

```

<SF base: sf int: TBP>+≡
  procedure :: base_write => sf_int_base_write
<SF base: procedures>+≡
  subroutine sf_int_base_write (object, unit, testflag)
    class(sf_int_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: testflag
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)", advance="no") "SF instance:"
    call write_sf_status (object%status, u)
    if (allocated (object%beam_index)) &
      write (u, "(3x,A,2(1x,I0))" "beam      =", object%beam_index
    if (allocated (object%incoming)) &
      write (u, "(3x,A,2(1x,I0))" "incoming  =", object%incoming
    if (allocated (object%radiated)) &

      write (u, "(3x,A,2(1x,I0))" "outgoing  =", object%outgoing
    if (allocated (object%par_index)) &
      write (u, "(3x,A,2(1x,I0))" "parameter =", object%par_index
    if (object%qmin_defined) &
      write (u, "(3x,A,1x," // FMT_19 // ")") "q_min     =", object%qmin
    if (object%qmax_defined) &
      write (u, "(3x,A,1x," // FMT_19 // ")") "q_max     =", object%qmax
    call interaction_write (object%interaction_t, u, testflag = testflag)
  end subroutine sf_int_base_write

```

The type string identifies the structure function class, and possibly more details about the structure function.

```

<SF base: sf int: TBP>+≡

```

```

    procedure (sf_int_type_string), deferred :: type_string
<SF base: interfaces>+≡
    abstract interface
        function sf_int_type_string (object) result (string)
            import
            class(sf_int_t), intent(in) :: object
            type(string_t) :: string
        end function sf_int_type_string
    end interface

```

Output of the concrete object. We should not forget to call the output routine for the base type.

```

<SF base: sf_int: TBP>+≡
    procedure (sf_int_write), deferred :: write
<SF base: interfaces>+≡
    abstract interface
        subroutine sf_int_write (object, unit, testflag)
            import
            class(sf_int_t), intent(in) :: object
            integer, intent(in), optional :: unit
            logical, intent(in), optional :: testflag
        end subroutine sf_int_write
    end interface

```

Basic initialization: set the invariant masses for the particles and initialize the interaction. The caller should then add states to the interaction and freeze it.

The dimension of the mask should be equal to the sum of the dimensions of the mass-squared arrays, which determine incoming, radiated, and outgoing particles, respectively.

Optionally, we can define minimum and maximum values for the momentum transfer to the outgoing particle(s). If all masses are zero, this is actually required for non-collinear splitting.

```

<SF base: sf_int: TBP>+≡
    procedure :: base_init => sf_int_base_init
<SF base: procedures>+≡
    subroutine sf_int_base_init &
        (sf_int, mask, mi2, mr2, mo2, qmin, qmax, hel_lock)

        sf_int%incoming = incoming
    end subroutine sf_int_set_incoming

    subroutine sf_int_set_radiated (sf_int, radiated)
        class(sf_int_t), intent(inout) :: sf_int
        integer, dimension(:), intent(in) :: radiated
        allocate (sf_int%radiated (size (radiated)))
        sf_int%radiated = radiated
    end subroutine sf_int_set_radiated

    subroutine sf_int_set_outgoing (sf_int, outgoing)
        class(sf_int_t), intent(inout) :: sf_int
        integer, dimension(:), intent(in) :: outgoing
        allocate (sf_int%outgoing (size (outgoing)))
        sf_int%outgoing = outgoing
    end subroutine sf_int_set_outgoing

```

Initialization. This proceeds via an abstract data object, which for the actual implementation should have the matching concrete type. Since all implementations have the same signature, we can prepare a deferred procedure. The data object will become the target of a corresponding pointer within the `sf_int_t` implementation.

This should call the previous procedure.

```

<SF base: sf_int: TBP>+≡
    procedure (sf_int_init), deferred :: init

<SF base: interfaces>+≡
    abstract interface
        subroutine sf_int_init (sf_int, data)
            import

```

```

        class(sf_int_t), intent(out) :: sf_int
        class(sf_data_t), intent(in), target :: data
    end subroutine sf_int_init
end interface

```

Complete initialization. This routine contains initializations that can only be performed after the interaction object got its final shape, i.e., redundant helicities have been eliminated by matching with beams and process.

The default implementation does nothing.

```

<SF base: sf_int: TBP>+≡
    procedure :: setup_constants => sf_int_setup_constants

<SF base: procedures>+≡
    subroutine sf_int_setup_constants (sf_int)
        class(sf_int_t), intent(inout) :: sf_int
    end subroutine sf_int_setup_constants

```

Set beam indices, i.e., the beam(s) on which this structure function applies.

```

<SF base: sf_int: TBP>+≡
    procedure :: set_beam_index => sf_int_set_beam_index

<SF base: procedures>+≡
    subroutine sf_int_set_beam_index (sf_int, beam_index)
        class(sf_int_t), intent(inout) :: sf_int
        integer, dimension(:), intent(in) :: beam_index
        allocate (sf_int%beam_index (size (beam_index)))
        sf_int%beam_index = beam_index
    end subroutine sf_int_set_beam_index

```

Set parameter indices, indicating which MC input parameters are to be used for evaluating this structure function.

```

<SF base: sf_int: TBP>+≡
    procedure :: set_par_index => sf_int_set_par_index

<SF base: procedures>+≡
    subroutine sf_int_set_par_index (sf_int, par_index)
        class(sf_int_t), intent(inout) :: sf_int
        integer, dimension(:), intent(in) :: par_index
        allocate (sf_int%par_index (size (par_index)))
        sf_int%par_index = par_index
    end subroutine sf_int_set_par_index

```

Initialize the structure-function kinematics, setting incoming momenta. We assume that array shapes match.

Three versions. The first version relies on the momenta being linked to another interaction. The second version sets the momenta explicitly. In the third version, we first compute momenta for the specified energies and store those.

```

<SF base: sf_int: TBP>+≡
    generic :: seed_kinematics => sf_int_receive_momenta
    generic :: seed_kinematics => sf_int_seed_momenta
    generic :: seed_kinematics => sf_int_seed_energies

```

```

procedure :: sf_int_receive_momenta
procedure :: sf_int_seed_momenta
procedure :: sf_int_seed_energies

<SF base: procedures>+=
subroutine sf_int_receive_momenta (sf_int)
  class(sf_int_t), intent(inout) :: sf_int
  if (sf_int%status >= SF_INITIAL) then
    call interaction_receive_momenta (sf_int%interaction_t)
    sf_int%status = SF_SEED_KINEMATICS
  end if
end subroutine sf_int_receive_momenta

subroutine sf_int_seed_momenta (sf_int, k)
  class(sf_int_t), intent(inout) :: sf_int
  type(vector4_t), dimension(:), intent(in) :: k
  if (sf_int%status >= SF_INITIAL) then
    call interaction_set_momenta (sf_int%interaction_t, k, &
      outgoing=.false.)
    sf_int%status = SF_SEED_KINEMATICS
  end if
end subroutine sf_int_seed_momenta

subroutine sf_int_seed_energies (sf_int, E)
  class(sf_int_t), intent(inout) :: sf_int

  type(vector4_t), dimension(:), allocatable :: k
  integer :: j
  if (sf_int%status >= SF_INITIAL) then
    allocate (k (size (E)))
    if (all (E**2 >= sf_int%mi2)) then
      do j = 1, size (E)
        k(j) = vector4_moving (E(j), &
          (3-2*j) * sqrt (E(j)**2 - sf_int%mi2(j)), 3)
      end do
      call sf_int%seed_kinematics (k)
    end if
  end if
end subroutine sf_int_seed_energies

```

Tell if in generator mode. By default, this is false. To be overridden where appropriate; we may refer to the `is_generator` method of the `data` component in the concrete type.

```

<SF base: sf_int: TBP>+=
  procedure :: is_generator => sf_int_is_generator

<SF base: procedures>+=
function sf_int_is_generator (sf_int) result (flag)
  class(sf_int_t), intent(in) :: sf_int
  logical :: flag
  flag = .false.
end function sf_int_is_generator

```

Generate free parameters **r**. Parameters are free if they do not correspond to integration parameters (i.e., are bound), but are generated by the structure function object itself. By default, all parameters are bound, and the output values of this procedure will be discarded. With free parameters, we have to override this procedure.

The value **x_free** is the renormalization factor of the total energy that corresponds to the free parameters. If there are no free parameters, the procedure will not change its value, which starts as unity. Otherwise, the fraction is typically decreased, but may also be increased in some cases.

```

(SF base: sf_int: TBP)+≡
  procedure :: generate_free => sf_int_generate_free

(SF base: procedures)+≡
  subroutine sf_int_generate_free (sf_int, r, rb, x_free)
    class(sf_int_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: r, rb
    real(default), intent(inout) :: x_free
    r = 0
    rb= 1
  end subroutine sf_int_generate_free

```

Complete the structure-function kinematics, derived from an input parameter (array) *r* between 0 and 1. The interaction momenta are calculated, and we return *x* (the momentum fraction), and *f* (the Jacobian factor for the map $r \rightarrow x$), if **map** is set.

If the **map** flag is unset, *r* and *x* values will coincide, and *f* will become unity. If it is set, the structure-function implementation chooses a convenient mapping from *r* to *x* with Jacobian *f*.

In the **inverse_kinematics** variant, we exchange the intent of **x** and **r**. The momenta are calculated only if the optional flag **set_momenta** is present and set.

```

(SF base: sf_int: TBP)+≡
  procedure (sf_int_complete_kinematics), deferred :: complete_kinematics
  procedure (sf_int_inverse_kinematics), deferred :: inverse_kinematics

(SF base: interfaces)+≡
  abstract interface
    subroutine sf_int_complete_kinematics (sf_int, x, f, r, rb, map)
      import
      class(sf_int_t), intent(inout) :: sf_int

Single splitting: compute momenta, given x input parameters. We assume that the incoming momentum is set. The status code is set to `SF_FAILED_KINEMATICS` if the x array does not correspond to a valid momentum configuration. Otherwise, it is updated to `SF_DONE_KINEMATICS`.

We force the outgoing particle on-shell. The on-shell projection is determined by the `on_shell_mode`. The radiated particle should already be on shell.

The inverse procedure: we compute the x array from the momentum configuration. In an overriding TBP, we may also set internal data that depend on this, for convenience.

NOTE: Here and above, the single-particle case is treated in detail, allowing for non-collinearity and non-vanishing masses and nontrivial momentum-transfer bounds. For the pair case, we currently implement only collinear splitting and assume massless particles. This should be improved.

NOTE: We should also improve this in the sense of extracting both x and \bar{x} , where for the latter we may consult the beam remnant. The current implementation is not sensitive to small \bar{x} values.

Apply the structure function, i.e., evaluate the interaction. For the calculation, we may use the stored momenta, any further information stored inside the `sf_int` implementation during kinematics setup, and the given energy scale. It may happen that for the given kinematics the value is not defined. This should be indicated by the status code.

```

<SF base: sf_int: TBP>+≡
  procedure (sf_int_apply), deferred :: apply

```

16.5.6 Structure-function instance

This is a wrapper for `sf_int_t` objects, such that we can build an array with different structure-function types. The structure-function contains an array (a sequence) of `sf_int_t` objects.

The object, it holds the evaluator that connects the preceding part of the structure-function chain to the current interaction.

It also stores the input and output parameter values for the contained structure function. The `r` array has a second dimension, corresponding to the mapping channels in a multi-channel configuration. There is a Jacobian entry `f` for each channel. The corresponding logical array `mapping` tells whether we apply the mapping appropriate for the current structure function in this channel. The `x` parameter values (energy fractions) are common to all channels.

(SF base: types)+≡

```

type :: sf_instance_t
class(sf_int_t), allocatable :: int
type(enumerator_t) :: eval
real(default), dimension(:,:), allocatable :: r
real(default), dimension(:,:), allocatable :: rb
real(default), dimension(:), allocatable :: f
logical, dimension(:), allocatable :: m
real(default), dimension(:), allocatable :: x
end type sf_instance_t

```

16.5.7 Structure-function chain

A chain is an array of structure functions `sf`, initiated by a beam setup. We do not use this directly for evaluation, but create instances with copies of the contained interactions.

`n_par` is the total number of parameters that is necessary for completely determining the structure-function chain. `n_bound` is the number of MC input parameters that are requested from the integrator. The difference of `n_par` and

`n_bound` is the number of free parameters, which are generated by a structure-function object in generator mode.

```

Initialize: setup beams. The `beam_data` target must remain valid for the lifetime of the chain, since we just establish a pointer. The structure-function configuration array is used to initialize the individual structure-function entries. The target attribute is needed because the `sf_int` entries establish pointers to the configuration data.

<SF base: sf chain: TBP>+≡

```

procedure :: init => sf_chain_init

```

<SF base: procedures>+≡

```

subroutine sf_chain_init (sf_chain, beam_data, sf_config)

16.5.8 Chain instances

A structure-function chain instance contains copies of the interactions in the configuration chain, suitably linked to each other and connected by evaluators.

After initialization, `out_sf` should point, for each beam, to the last structure function that affects this beam. `out_sf_i` should indicate the index of the corresponding outgoing particle within that structure-function interaction.

Analogously, `out_eval` is the last evaluator in the structure-function chain, which contains the complete set of outgoing particles. `out_eval_i` should indicate the index of the outgoing particles, within that evaluator, which will initiate the collision.

When calculating actual kinematics, we fill the `p`, `r`, and `x` arrays and the `f` factor. The `p` array denotes the MC input parameters as they come from the random-number generator. The `r` array results from applying global mappings. The `x` array results from applying structure-function local mappings. The `x` values can be interpreted directly as momentum fractions (or angle fractions, where recoil is involved). The `f` factor is the Jacobian that results from applying all mappings.

The `mapping` entry may store a global mapping that is applied to a combination of `x` values and structure functions, as opposed to mappings that affect only a single structure function. It is applied before the latter mappings, in the transformation from the `p` array to the `r` array. For parameters affected by this mapping, we should ensure that they are not involved in a local mapping.

Initialize. This creates a copy of the interactions in the configuration chain, assumed to be properly initialized. In the copy, we allocate the `p` etc. arrays.

The brute-force assignment of the `sf` component would be straightforward, but at least gfortran 4.6.3 would like a more fine-grained copy. In any case, the copy is deep as far as allocatables are concerned, but for the contained `interaction_t` objects the copy is shallow, as long as we do not bind defined assignment to the type. Therefore, we have to re-assign the `interaction_t` components explicitly, this time calling the proper defined assignment. Fur-

thermore, we allocate the parameter arrays for each structure function.

Manually select a channel.

```
<SF base: sf chain instance: TBP>+≡
  procedure :: select_channel => sf_chain_instance_select_channel

<SF base: procedures>+≡
  subroutine sf_chain_instance_select_channel (chain, channel)
    class(sf_chain_instance_t), intent(inout) :: chain
    integer, intent(in), optional :: channel
    if (present (channel)) then
      chain%selected_channel = channel
    else
      chain%selected_channel = 0
    end if
  end subroutine sf_chain_instance_select_channel
```

Copy a channel-mapping object to the structure-function chain instance. We assume that assignment is sufficient, i.e., any non-static components of the `channel` object are allocatable und thus recursively copied.

After the copy, we extract the single-entry mappings and activate them for the individual structure functions. If there is a multi-entry mapping, we obtain the corresponding MC parameter indices and set them in the copy of the channel object.

```
<SF base: sf chain instance: TBP>+≡
  procedure :: set_channel => sf_chain_instance_set_channel

<SF base: procedures>+≡
  subroutine sf_chain_instance_set_channel (chain, c, channel)
    class(sf_chain_instance_t), intent(inout) :: chain
    integer, intent(in) :: c
    type(sf_channel_t), intent(in) :: channel
    integer :: i, j, k

      end do
      chain%status = SF_INITIAL
    end if
  end subroutine sf_chain_instance_set_channel
```

Link the interactions in the chain. First, link the beam instance to its template in the configuration chain, which should have the appropriate momenta fixed.

Then, we follow the chain via the arrays `out_sf` and `out_sf_i`. The arrays are (up to) two-dimensional, the entries correspond to the beam particle(s). For each beam, the entry `out_sf` points to the last interaction that affected this beam, and `out_sf_i` is the out-particle index within that interaction. For the initial beam, `out_sf` is zero by definition.

For each entry in the chain, we scan the affected beams (one or two). We look for `out_sf` and link the out-particle there to the corresponding in-particle in the current interaction. Then, we update the entry in `out_sf` and `out_sf_i` to point to the current interaction.

```

Exchange the quantum-number masks between the interactions in the chain, so we can combine redundant entries and detect any obvious mismatch.

We proceed first in the forward direction and then backwards again.

After this is finished, we finalize initialization by calling the `setup_constants` method, which prepares constant data that depend on the matrix element structure.

    end if
    chain%status = SF_DONE_CONNECTIONS
end if
contains
<SF base: init evaluators: find outgoing particles>
end subroutine sf_chain_instance_init_evaluators

```

This is an internal subroutine of the previous one: After evaluators are set, trace the outgoing particles to the last evaluator. We only need the first channel, all channels are equivalent for this purpose.

For each beam, the outgoing particle is located by `out_sf` (the structure-function object where it originates) and `out_sf_i` (the index within that object). This particle is referenced by the corresponding evaluator, which in turn is referenced by the next evaluator, until we are at the end of the chain. We can trace back references by `interaction_find_link`. Knowing that `out_eval` is the index of the last evaluator, we thus determine `out_eval_i`, the index of the outgoing particle within that evaluator.

```

<SF base: init evaluators: find outgoing particles>≡
subroutine find_outgoing_particles ()

    end do
end subroutine find_outgoing_particles

```

Compute the kinematics in the chain instance. We can assume that the seed momenta are set in the configuration beams. Scanning the chain, we first transfer the incoming momenta. Then, we use up the MC input parameter array **p** to compute the radiated and outgoing momenta.

In the multi-channel case, **c_sel** is the channel which we use for computing the kinematics and the **x** values. In the other channels, we invert the kinematics in order to recover the corresponding rows in the **r** array, and the Jacobian **f**.

We first apply any global mapping to transform the input **p** into the array **r**. This is then given to the structure functions which compute the final array **x** and Jacobian factors **f**, which we multiply to obtain the overall Jacobian.

This is a variant of the previous procedure. We know the x parameters and reconstruct the momenta and the MC input parameters p . We do not need to select a channel.

Note: this is probably redundant, since the method we actually want starts from the momenta, recovers all x parameters, and then inverts mappings. See below `recover_kinematics`.

Recover the kinematics: assuming that the last evaluator has been filled with a valid set of momenta, we travel the momentum links backwards and fill the preceding evaluators and, as a side effect, interactions. We stop at the beam interaction.

After all momenta are set, apply the `inverse_kinematics` procedure above, suitably modified, to recover the x and p parameters and the Jacobian factors.

The `c_sel` (channel) argument is just used to mark a selected channel for the records, otherwise the recovery procedure is independent of this.

    <SF base: execute tests>
  end subroutine sf_base_test

```

16.5.11 Test implementation: structure function

This is a template for the actual structure-function implementation which will be defined in separate modules.

Configuration data

The test structure function uses the `Test` model. It describes a scalar within an arbitrary initial particle, which is given in the initialization. The radiated particle is also a scalar, the same one, but we set its mass artificially to zero.

```
<SF base: public>+=  
  public :: sf_test_data_t  
  
<SF base: test types>=  
  type, extends (sf_data_t) :: sf_test_data_t  
    class(model_data_t), pointer :: model => null ()  
    integer :: mode = 0  
    type(flavor_t) :: flv_in  
    type(flavor_t) :: flv_out  
    type(flavor_t) :: flv_rad  
    real(default) :: m = 0  
    logical :: collinear = .true.  
    real(default), dimension(:), allocatable :: qbounds  
  contains  
    <SF base: sf test data: TBP>  
  end type sf_test_data_t
```

Output.

```
<SF base: sf test data: TBP>=  
  procedure :: write => sf_test_data_write  
  
<SF base: procedures>+=  
  subroutine sf_test_data_write (data, unit, verbose)  
    class(sf_test_data_t), intent(in) :: data  
    integer, intent(in), optional :: unit  
    logical, intent(in), optional :: verbose  
    integer :: u  
    u = given_output_unit (unit)  
    write (u, "(1x,A)") "SF test data:"  
    write (u, "(3x,A,A)") "model      = ", char (data%model%get_name ())  
    write (u, "(3x,A)", advance="no") "incoming  = "  
    call flavor_write (data%flv_in, u); write (u, *)  
    write (u, "(3x,A)", advance="no") "outgoing   = "  
    call flavor_write (data%flv_out, u); write (u, *)  
    write (u, "(3x,A)", advance="no") "radiated   = "  
    call flavor_write (data%flv_rad, u); write (u, *)  
    write (u, "(3x,A," // FMT_19 // ")") "mass       = ", data%m  
    write (u, "(3x,A,L1)") "collinear = ", data%collinear  
    if (.not. data%collinear .and. allocated (data%qbounds)) then  
      write (u, "(3x,A," // FMT_19 // ")") "qmin       = ", data%qbounds(1)

    sf_int%status = SF_EVALUATED
  end subroutine sf_test_apply
```

16.5.12 Test implementation: pair spectrum

Another template, this time for a incoming particle pair, splitting into two radiated and two outgoing particles.

Configuration data

For simplicity, the spectrum contains two mirror images of the previous structure-function configuration: the incoming and all outgoing particles are test scalars.

We have two versions, one with radiated particles, one without.

```
<SF base: test types>+≡
  type, extends (sf_data_t) :: sf_test_spectrum_data_t
    class(model_data_t), pointer :: model => null ()
    type(flavor_t) :: flv_in
    type(flavor_t) :: flv_out
    type(flavor_t) :: flv_rad
    logical :: with_radiation = .true.
    real(default) :: m = 0
  contains
    <SF base: sf test spectrum data: TBP>
  end type sf_test_spectrum_data_t
```

Output.

```
<SF base: sf test spectrum data: TBP>≡
  procedure :: write => sf_test_spectrum_data_write
```

<SF base: procedures>+≡

```

subroutine sf_test_spectrum_data_write (data, unit, verbose)
  class(sf_test_spectrum_data_t), intent(in) :: data
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: verbose
  integer :: u
  u = given_output_unit (unit)
  write (u, "(1x,A)") "SF test spectrum data:"
  write (u, "(3x,A,A)") "model      = ", char (data%model%get_name ())
  write (u, "(3x,A)", advance="no") "incoming = "
  call flavor_write (data%flv_in, u); write (u, *)
  write (u, "(3x,A)", advance="no") "outgoing = "
  call flavor_write (data%flv_out, u); write (u, *)
  write (u, "(3x,A)", advance="no") "radiated = "
  call flavor_write (data%flv_rad, u); write (u, *)
  write (u, "(3x,A," // FMT_19 // ")") "mass      = ", data%m
end subroutine sf_test_spectrum_data_write

```

Initialization.

<SF base: sf test spectrum data: TBP>+≡

```

procedure :: init => sf_test_spectrum_data_init

```

<SF base: procedures>+≡

```

subroutine sf_test_spectrum_data_init (data, model, pdg_in, with_radiation)
  class(sf_test_spectrum_data_t), intent(out) :: data

16.5.13 Test implementation: generator spectrum

A generator for two beams, no radiation (for simplicity).

Configuration data

For simplicity, the spectrum contains two mirror images of the previous structure-function configuration: the incoming and all outgoing particles are test scalars.

We have two versions, one with radiated particles, one without.

```
<SF base: test types>+≡
  type, extends (sf_data_t) :: sf_test_generator_data_t
    class(model_data_t), pointer :: model => null ()
    type(flavor_t) :: flv_in
    type(flavor_t) :: flv_out
    type(flavor_t) :: flv_rad
    real(default) :: m = 0
  contains
    <SF base: sf test generator data: TBP>
  end type sf_test_generator_data_t
```

Output.

```
<SF base: sf test generator data: TBP>≡
  procedure :: write => sf_test_generator_data_write

<SF base: procedures>+≡
  subroutine sf_test_generator_data_write (data, unit, verbose)
    class(sf_test_generator_data_t), intent(in) :: data
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "SF test generator data:"
    write (u, "(3x,A,A)") "model      = ", char (data%model%get_name ())
    write (u, "(3x,A)", advance="no") "incoming  = "

Structure function instance configuration

We create a structure-function chain instance which implements a configured structure-function chain. We link the momentum entries in the interactions and compute kinematics.

We do not actually connect the interactions and create evaluators. We skip this step and manually advance the status of the chain instead.

```

Chapter 17

Phase Space

The abstract representation of a type that parameterizes phase space, with methods for construction and evaluation.

phs_base Abstract phase-space representation.

17.1 Abstract phase-space module

In this module we define an abstract base type (and a trivial test implementation) for multi-channel phase-space parameterizations.

```
<phs_base.f90>≡  
<File header>  
  
module phs_base  
  
  <Use kinds>  
  <Use strings>  
  use io_units  
  use constants, only: TWOPI, TWOPI4  
  use format_defs, only: FMT_19  
  use unit_tests  
  use diagnostics  
  use md5  
  use physics_defs  
  use lorentz  
  use model_data  
  use flavors  
  use sf_mappings  
  use sf_base  
  use process_constants  
  
  <Standard module head>  
  
  <PHS base: public>  
  
  <PHS base: types>  
  
  <PHS base: interfaces>  
  
  <PHS base: test types>  
  
  contains  
  
  <PHS base: procedures>  
  
  <PHS base: tests>  
  
end module phs_base
```

17.1.1 Phase-space channels

The kinematics configuration may generate multiple parameterizations of phase space. Some of those have specific properties, such as a resonance in the s channel.

Channel properties

This is the abstract type for the channel properties. We need them as a data transfer container, so everything is public and transparent.

```

<PHS base: public>≡
  public :: channel_prop_t

<PHS base: types>≡
  type, abstract :: channel_prop_t
  contains
    procedure (channel_prop_to_string), deferred :: to_string
    generic :: operator (==) => is_equal
    procedure (channel_eq), deferred :: is_equal
  end type channel_prop_t

<PHS base: interfaces>≡
  abstract interface
    function channel_prop_to_string (object) result (string)
      import
        class(channel_prop_t), intent(in) :: object
        type(string_t) :: string
      end function channel_prop_to_string
  end interface

<PHS base: interfaces>+≡
  abstract interface
    function channel_eq (prop1, prop2) result (flag)
      import
        class(channel_prop_t), intent(in) :: prop1, prop2
        logical :: flag
      end function channel_eq
  end interface

```

Here is a resonance as a channel property. Mass and width are stored here in physical units.

```

<PHS base: public>+≡
  public :: resonance_t

<PHS base: types>+≡
  type, extends (channel_prop_t) :: resonance_t
    real(default) :: mass = 0
    real(default) :: width = 0
  contains
    procedure :: to_string => resonance_to_string
    procedure :: is_equal => resonance_is_equal
  end type resonance_t

```

Print mass and width.

```

<PHS base: procedures>≡
  function resonance_to_string (object) result (string)
    class(resonance_t), intent(in) :: object
    type(string_t) :: string
    character(32) :: buffer
    string = "resonant: m ="
    write (buffer, "(" // FMT_19 // ")") object%mass
    string = string // trim (buffer) // " GeV, w ="
    write (buffer, "(" // FMT_19 // ")") object%width
  end function resonance_to_string

```

```

    string = string // trim (buffer) // " GeV"
end function resonance_to_string

```

Equality.

```

(PHS base: procedures)+≡
function resonance_is_equal (prop1, prop2) result (flag)
  class(resonance_t), intent(in) :: prop1
  class(channel_prop_t), intent(in) :: prop2
  logical :: flag
  select type (prop2)
  type is (resonance_t)
    flag = prop1%mass == prop2%mass .and. prop1%width == prop2%width
  class default
    flag = .false.
  end select
end function resonance_is_equal

```

This is the limiting case of a resonance, namely an on-shell particle. We just store the mass in physical units.

```

(PHS base: public)+≡
  public :: on_shell_t

(PHS base: types)+≡
  type, extends (channel_prop_t) :: on_shell_t
    real(default) :: mass = 0
  contains
    procedure :: to_string => on_shell_to_string
    procedure :: is_equal => on_shell_is_equal
  end type on_shell_t

```

Print mass and width.

```

(PHS base: procedures)+≡
function on_shell_to_string (object) result (string)
  class(on_shell_t), intent(in) :: object
  type(string_t) :: string
  character(32) :: buffer
  string = "on shell: m ="
  write (buffer, "(" // FMT_19 // ")") object%mass
  string = string // trim (buffer) // " GeV"
end function on_shell_to_string

```

Equality.

```

(PHS base: procedures)+≡
function on_shell_is_equal (prop1, prop2) result (flag)
  class(on_shell_t), intent(in) :: prop1
  class(channel_prop_t), intent(in) :: prop2
  logical :: flag
  select type (prop2)
  type is (on_shell_t)
    flag = prop1%mass == prop2%mass
  class default
    flag = .false.
  end select
end function on_shell_is_equal

```

```

        end select
    end function on_shell_is_equal

```

Channel equivalences

This type describes an equivalence. The current channel is equivalent to channel `c`. The equivalence involves a permutation `perm` of integration dimensions and, within each integration dimension, a mapping `mode`.

```

<PHS base: types>+≡
    type :: phs_equivalence_t
        integer :: c = 0
        integer, dimension(:), allocatable :: perm
        integer, dimension(:), allocatable :: mode
    contains
        <PHS base: phs equivalence: TBP>
    end type phs_equivalence_t

```

The mapping modes are

```

<PHS base: types>+≡
    integer, parameter, public :: &
        EQ_IDENTITY = 0, EQ_INVERT = 1, EQ_SYMMETRIC = 2, EQ_INVARIANT = 3

```

In particular, if a channel is equivalent to itself in the `EQ_SYMMETRIC` mode, the integrand can be assumed to be symmetric w.r.t. a reflection $x \rightarrow 1 - x$ of the corresponding integration variable.

These are the associated tags, for output:

```

<PHS base: types>+≡
    character, dimension(0:3), parameter :: TAG = ["+", "-", ":", "x"]

```

Write an equivalence.

```

<PHS base: phs equivalence: TBP>≡
    procedure :: write => phs_equivalence_write

<PHS base: procedures>+≡
    subroutine phs_equivalence_write (object, unit)
        class(phs_equivalence_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u, j
        u = given_output_unit (unit)
        write (u, "(5x,'=',1x,I0,1x)", advance = "no") object%c
        if (allocated (object%perm)) then
            write (u, "(A)", advance = "no") "("
            do j = 1, size (object%perm)
                if (j > 1) write (u, "(1x)", advance = "no")
                write (u, "(I0,A1)", advance = "no") &
                    object%perm(j), TAG(object%mode(j))
            end do
            write (u, "(A)") ")"
        else
            write (u, "(A)")
        end if
    end subroutine

```

```
end subroutine phs_equivalence_write
```

Initialize an equivalence. This allocates the `perm` and `mode` arrays with equal size.

```
<PHS base: phs equivalence: TBP>+≡
  procedure :: init => phs_equivalence_init
<PHS base: procedures>+≡
  subroutine phs_equivalence_init (eq, n_dim)
    class(phs_equivalence_t), intent(out) :: eq
    integer, intent(in) :: n_dim
    allocate (eq%perm (n_dim), source = 0)
    allocate (eq%mode (n_dim), source = EQ_IDENTITY)
  end subroutine phs_equivalence_init
```

Channel objects

The channel entry holds (optionally) specific properties.

`sf_channel` is the structure-function channel that corresponds to this phase-space channel. The structure-function channel may be set up with a specific mapping that depends on the phase-space channel properties. (The default setting is to leave the properties empty.)

```
<PHS base: public>+≡
  public :: phs_channel_t
<PHS base: types>+≡
  type :: phs_channel_t
    class(channel_prop_t), allocatable :: prop
    integer :: sf_channel = 1
    type(phs_equivalence_t), dimension(:), allocatable :: eq
  contains
    <PHS base: phs channel: TBP>
  end type phs_channel_t
```

Output.

```
<PHS base: phs channel: TBP>≡
  procedure :: write => phs_channel_write
<PHS base: procedures>+≡
  subroutine phs_channel_write (object, unit)
    class(phs_channel_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, j
    u = given_output_unit (unit)
    write (u, "(1x,I0)", advance="no") object%sf_channel
    if (allocated (object%prop)) then
      write (u, "(1x,A)") char (object%prop%to_string ())
    else
      write (u, *)
    end if
    if (allocated (object%eq)) then
      do j = 1, size (object%eq)
```

```

        call object%eq(j)%write (u)
    end do
end if
end subroutine phs_channel_write

```

Identify the channel with an s-channel resonance.

```

<PHS base: phs channel: TBP>+≡
    procedure :: set_resonant => channel_set_resonant

<PHS base: procedures>+≡
    subroutine channel_set_resonant (channel, mass, width)
        class(phs_channel_t), intent(inout) :: channel
        real(default), intent(in) :: mass, width
        allocate (resonance_t :: channel%prop)
        select type (prop => channel%prop)
        type is (resonance_t)
            prop%mass = mass
            prop%width = width
        end select
    end subroutine channel_set_resonant

```

Identify the channel with an on-shell particle.

```

<PHS base: phs channel: TBP>+≡
    procedure :: set_on_shell => channel_set_on_shell

<PHS base: procedures>+≡
    subroutine channel_set_on_shell (channel, mass)

```

17.1.3 Kinematics configuration

Here, we store the universal information that is specifically relevant for phase-space generation. It is a subset of the process data, supplemented by basic information on phase-space parameterization channels.

A concrete implementation will contain more data, that describe the phase space in detail.

MD5 sums: the phase space setup depends on the process, it depends on the model parameters (the masses, that is), and on the configuration parameters. (It doesn't depend on the QCD setup.)

```

<PHS base: public>+≡
  public :: phs_config_t

<PHS base: types>+≡
  type, abstract :: phs_config_t
    ! private
    type(string_t) :: id
    integer :: n_in = 0
    integer :: n_out = 0
    integer :: n_tot = 0
    integer :: n_state = 0
    integer :: n_par = 0
    integer :: n_channel = 0
    real(default) :: sqrts = 0
    logical :: sqrts_fixed = .true.
    logical :: cm_frame = .true.
    logical :: azimuthal_dependence = .false.
    integer, dimension(:), allocatable :: dim_flat

    end if
    allocate (phs_config%flv (phs_config%n_tot, phs_config%n_state))
    do i = 1, phs_config%n_state
        do j = 1, phs_config%n_tot
            call flavor_init (phs_config%flv(j,i), data%flv_state(j,i), &
                phs_config%model)
        end do
    end do

```

```

end do
phs_config%md5sum_process = data%md5sum
end subroutine phs_config_init

```

This procedure should complete the phase-space configuration. We need the `sqrts` value as overall scale, which is known only after the beams have been defined. The procedure should determine the number of channels, their properties (if any), and allocate and fill the `channel` array accordingly.

```

<PHS base: phs config: TBP>+≡
  procedure (phs_config_configure), deferred :: configure

<PHS base: interfaces>+≡
  abstract interface
    subroutine phs_config_configure (phs_config, sqrts, &
      sqrts_fixed, cm_frame, azimuthal_dependence, rebuild, ignore_mismatch, &
      nlo_type)
    import
    class(phs_config_t), intent(inout) :: phs_config
    real(default), intent(in) :: sqrts
    logical, intent(in), optional :: sqrts_fixed
    logical, intent(in), optional :: cm_frame
    logical, intent(in), optional :: azimuthal_dependence
    logical, intent(in), optional :: rebuild
    logical, intent(in), optional :: ignore_mismatch
    type(string_t), intent(inout), optional :: nlo_type
  end subroutine phs_config_configure
end interface

```

Manually assign structure-function channel indices to the phase-space channel objects. (Used by a test routine.)

```

<PHS base: phs config: TBP>+≡
  procedure :: set_sf_channel => phs_config_set_sf_channel

<PHS base: procedures>+≡
  subroutine phs_config_set_sf_channel (phs_config, sf_channel)
    class(phs_config_t), intent(inout) :: phs_config
    integer, dimension(:), intent(in) :: sf_channel
    phs_config%channel%sf_channel = sf_channel
  end subroutine phs_config_set_sf_channel

```

Collect new channels not yet in the collection from this phase-space configuration object. At the same time, assign structure-function channels.

```

<PHS base: phs config: TBP>+≡
  procedure :: collect_channels => phs_config_collect_channels

<PHS base: procedures>+≡
  subroutine phs_config_collect_channels (phs_config, coll)
    class(phs_config_t), intent(inout) :: phs_config
    type(phs_channel_collection_t), intent(inout) :: coll
    integer :: c
    do c = 1, phs_config%n_channel
      call coll%push (phs_config%channel(c))
    end do
  end subroutine

```

```
end subroutine phs_config_collect_channels
```

Compute the MD5 sum. We abuse the `write` method. In type implementations, `write` should only display information that is relevant for the MD5 sum. The data include the process MD5 sum which is taken from the process constants, and the MD5 sum of the model parameters. This may change, so it is computed here.

```
<PHS base: phs config: TBP>+≡
  procedure :: compute_md5sum => phs_config_compute_md5sum
<PHS base: procedures>+≡
  subroutine phs_config_compute_md5sum (phs_config)
    class(phs_config_t), intent(inout) :: phs_config
    integer :: u
    phs_config%md5sum_model_par = phs_config%model%get_parameters_md5sum ()
    phs_config%md5sum_phs_config = ""
    u = free_unit ()
    open (u, status = "scratch", action = "readwrite")
    call phs_config%write (u)
    rewind (u)
    phs_config%md5sum_phs_config = md5sum (u)
    close (u)
  end subroutine phs_config_compute_md5sum
```

Print an informative message after phase-space configuration.

```
<PHS base: phs config: TBP>+≡
  procedure (phs_startup_message), deferred :: startup_message
  procedure :: base_startup_message => phs_startup_message
<PHS base: procedures>+≡
  subroutine phs_startup_message (phs_config, unit)
    class(phs_config_t), intent(in) :: phs_config
    integer, intent(in), optional :: unit
    write (msg_buffer, "(A,3(1x,I0,1x,A))") &
      "Phase space:", &
      phs_config%n_channel, "channels,", &
      phs_config%n_par, "dimensions"
    call msg_message (unit = unit)
  end subroutine phs_startup_message
```

This procedure should be implemented such that the phase-space configuration object allocates a phase-space instance of matching type.

```
<PHS base: phs config: TBP>+≡
  procedure (phs_config_allocate_instance), nopass, deferred :: &
    allocate_instance
<PHS base: interfaces>+≡
  abstract interface
    subroutine phs_config_allocate_instance (phs)
      import
      class(phs_t), intent(inout), pointer :: phs
    end subroutine phs_config_allocate_instance
  end interface
```

17.1.4 Extract data

Return the number of MC input parameters.

```
<PHS base: phs config: TBP>+≡
  procedure :: get_n_par => phs_config_get_n_par

<PHS base: procedures>+≡
  function phs_config_get_n_par (phs_config) result (n)
    class(phs_config_t), intent(in) :: phs_config
    integer :: n
    n = phs_config%n_par
  end function phs_config_get_n_par
```

Return dimensions (parameter indices) for which the phase-space dimension is flat, so integration and event generation can be simplified.

```
<PHS base: phs config: TBP>+≡
  procedure :: get_flat_dimensions => phs_config_get_flat_dimensions

<PHS base: procedures>+≡
  function phs_config_get_flat_dimensions (phs_config) result (dim_flat)
    class(phs_config_t), intent(in) :: phs_config
    integer, dimension(:), allocatable :: dim_flat
    if (allocated (phs_config%dim_flat)) then
      allocate (dim_flat (size (phs_config%dim_flat)))
      dim_flat = phs_config%dim_flat
    else
      allocate (dim_flat (0))
    end if
  end function phs_config_get_flat_dimensions
```

Return the number of phase-space channels.

```
<PHS base: phs config: TBP>+≡
  procedure :: get_n_channel => phs_config_get_n_channel

<PHS base: procedures>+≡
  function phs_config_get_n_channel (phs_config) result (n)

    end function phs_config_get_md5sum

```

17.1.5 Phase-space point instance

The `phs_t` object holds the workspace for phase-space generation. In the base object, we have the MC input parameters `r` and the Jacobian factor `f`, for each channel, and the incoming and outgoing momenta.

Note: The `active_channel` array is not used yet, all elements are initialized with `.true..` It should be touched by the integrator if it decides to drop irrelevant channels.

```

<PHS base: public>+≡
    public :: phs_t

<PHS base: types>+≡
    type, abstract :: phs_t
        class(phs_config_t), pointer :: config => null ()

  end subroutine phs_base_select_channel

```

Set incoming momenta. Assume that array shapes match. If requested, compute the Lorentz transformation from the c.m. to the lab frame and apply that transformation to the incoming momenta.

In the c.m. frame, the sum of three-momenta is zero. In a scattering process, the z axis is the direction of the first beam, the second beam is along the negative z axis. The transformation from the c.m. to the lab frame is a rotation from the z axis to the boost axis followed by a boost, such that the c.m. momenta are transformed into the lab-frame momenta. In a decay process, we just boost along the flight direction, without rotation.

```

        real(default) :: f
        f = phs%flux * phs%volume
    end function phs_get_overall_factor

```

Compute flux factor. We do this during initialization (when the incoming momenta \mathbf{p} are undefined), unless `sqrts` is variable. We do this again once for each phase-space point, but then we skip the calculation if `sqrts` is fixed.

There are three different flux factors.

1. For a decaying massive particle, the factor is

$$f = (2\pi)^4/(2M) \quad (17.1)$$

2. For a $2 \rightarrow n$ scattering process with $n > 1$, the factor is

$$f = (2\pi)^4/(2\sqrt{\lambda}) \quad (17.2)$$

where for massless incoming particles, $\sqrt{\lambda} = s$.

3. For a $2 \rightarrow 1$ on-shell production process, the factor includes an extra $1/(2\pi)^3$ factor and a $1/m^2$ factor from the phase-space delta function $\delta(x_1 x_2 - m^2/s)$, which originate from the one-particle phase space that we integrate out.

$$f = 2\pi/(2sm^2) \quad (17.3)$$

The delta function is handled by the structure-function parameterization.

```

      integer, intent(in) :: c_in
    end subroutine phs_evaluate_other_channels
  end interface

```

Inverse evaluation. If all momenta are known, we compute the inverse mappings to fill the **r** and **f** arrays.

```

<PHS base: phs: TBP>+≡
  procedure (phs_inverse), deferred :: inverse

<PHS base: interfaces>+≡
  abstract interface
    subroutine phs_inverse (phs)
      import
      class(phs_t), intent(inout) :: phs
    end subroutine phs_inverse
  end interface

```

17.1.6 Auxiliary stuff

The **pacify** subroutine, which is provided by the Lorentz module, has the purpose of setting numbers to zero which are (by comparing with a **tolerance** parameter) considered equivalent with zero. This is useful for numerical checks.

```

<PHS base: public>+≡
  public :: pacify

<PHS base: interfaces>+≡
  interface pacify
    module procedure pacify_phs
  end interface pacify

<PHS base: procedures>+≡
  subroutine pacify_phs (phs)
    class(phs_t), intent(inout) :: phs
    if (phs%p_defined) then
      call pacify (phs%p, 30 * epsilon (1._default) * phs%config%sqrts)
      call pacify (phs%lt_cm_to_lab, 30 * epsilon (1._default))
    end if
    if (phs%q_defined) then
      call pacify (phs%q, 30 * epsilon (1._default) * phs%config%sqrts)
    end if
  end subroutine pacify_phs

```

17.1.7 Unit tests

```

<PHS base: public>+≡
  public :: phs_base_test

```

```

<PHS base: tests>≡
  subroutine phs_base_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <PHS base: execute tests>
  end subroutine phs_base_test

```

Test process data

We provide a procedure that initializes a test case for the process constants. This set of process data contains just the minimal contents that we need for the phase space. The rest is left uninitialized.

```

<PHS base: public>+≡
  public :: init_test_process_data

<PHS base: tests>+≡
  subroutine init_test_process_data (id, data)
    type(process_constants_t), intent(out) :: data
    type(string_t), intent(in), optional :: id
    if (present (id)) then
      data%id = id
    else
      data%id = "testproc"
    end if
    data%model_name = "Test"
    data%n_in = 2
    data%n_out = 2
    data%n_flv = 1
    allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
    data%flv_state = 25
  end subroutine init_test_process_data

```

This is the variant for a decay process.

```

<PHS base: public>+≡
  public :: init_test_decay_data

<PHS base: tests>+≡
  subroutine init_test_decay_data (id, data)
    type(process_constants_t), intent(out) :: data
    type(string_t), intent(in), optional :: id
    if (present (id)) then
      data%id = id
    else
      data%id = "testproc"
    end if
    data%model_name = "Test"
    data%n_in = 1
    data%n_out = 2
    data%n_flv = 1
    allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
    data%flv_state(:,1) = [25, 6, -6]
  end subroutine init_test_decay_data

```

Test kinematics configuration

This is a trivial implementation of the `phs_config_t` configuration object.

```
<PHS base: public>+≡
    public :: phs_test_config_t
<PHS base: test types>≡
    type, extends (phs_config_t) :: phs_test_config_t
        logical :: create_equivalences = .false.
    contains
        procedure :: final => phs_test_config_final
        procedure :: write => phs_test_config_write
        procedure :: configure => phs_test_config_configure
        procedure :: startup_message => phs_test_config_startup_message
        procedure, nopass :: allocate_instance => phs_test_config_allocate_instance
    end type phs_test_config_t
```

The finalizer is empty.

```
<PHS base: tests>+≡
    subroutine phs_test_config_final (object)
        class(phs_test_config_t), intent(inout) :: object

    allocate (phs_test_t :: phs)
  end subroutine phs_test_config_allocate_instance
```

Test kinematics implementation

This implementation of kinematics generates a simple two-particle configuration from the incoming momenta. The incoming momenta must be in the c.m. system, all masses equal.

There are two channels: one generates $\cos\theta$ and ϕ uniformly, in the other channel we map the r_1 parameter which belongs to $\cos\theta$.

We should store the mass parameter that we need.

```
<PHS base: public>+≡
  public :: phs_test_t
<PHS base: test types>+≡
  type, extends (phs_t) :: phs_test_t
    real(default) :: m = 0
    real(default), dimension(:), allocatable :: x
  contains
    <PHS base: phs test: TBP>
  end type phs_test_t
```

Output. The specific data are displayed only if `verbose` is set.

```
<PHS base: phs test: TBP>≡
  procedure :: write => phs_test_write
<PHS base: tests>+≡
  subroutine phs_test_write (object, unit, verbose)
    class(phs_test_t), intent(in) :: object
    integer, intent(in), optional :: unit

    if (phs%r(1,2) /= 0) then
      phs%f(2) = 1 / (3 * phs%r(1,2) ** (2/3._default))
    else
      phs%f(2) = 0
    end if
    phs%volume = 1
    phs%r_defined = .true.
  end if
end subroutine

```

```

end if
end subroutine phs_test_inverse

```

Uniform angular distribution

These procedures implement the uniform angular distribution, generated from two parameters x_1 and x_2 :

$$\cos \theta = 1 - 2x_1, \quad \phi = 2\pi x_2 \quad (17.4)$$

We generate a rotation (Lorentz transformation) which rotates the positive z axis into this point on the unit sphere. This rotation is applied to the \mathbf{p} momenta, which are assumed to be back-to-back, on-shell, and with the correct mass.

We do not compute a Jacobian (constant). The uniform distribution is assumed to be normalized.

```

<PHS base: public>+≡
  public :: compute_kinematics_solid_angle

<PHS base: tests>+≡
  subroutine compute_kinematics_solid_angle (p, q, x)
    type(vector4_t), dimension(2), intent(in) :: p
    type(vector4_t), dimension(2), intent(out) :: q
    real(default), dimension(2), intent(in) :: x
    real(default) :: ct, st, phi
    type(lorentz_transformation_t) :: rot
    integer :: i
    ct = 1 - 2*x(1)
    st = sqrt (1 - ct**2)
    phi = twopi * x(2)
    rot = rotation (phi, 3) * rotation (ct, st, 2)
    do i = 1, 2
      q(i) = rot * p(i)
    end do
  end subroutine compute_kinematics_solid_angle

```

This is the inverse transformation. We assume that the outgoing momenta are rotated versions of the incoming momenta, back-to-back. Thus, we determine the angles from $q(1)$ alone. p is unused.

```

<PHS base: public>+≡
  public :: inverse_kinematics_solid_angle

Chapter 18

Multi-Channel Integration

The abstract representation of multi-channel Monte Carlo algorithms for integration and event generation.

Module `mci_base`: The abstract types and their methods. It provides a test integrator that is referenced in later unit tests.

`iterations` Container for defining integration call and pass settings.

`integration_results` This module handles results from integrating processes. It records passes and iterations, calculates statistical averages, and provides the user output of integration results.

18.1 Generic Integrator

This module provides a multi-channel integrator (MCI) base type, a corresponding configuration type, and methods for integration and event generation.

```

18.1.1 MCI: integrator

The MCI object contains the methods for integration and event generation. For the actual work and data storage, it spawns an MCI instance object.

The base object contains the number of integration dimensions and the number of channels as configuration data. Further configuration data are stored in the concrete extensions.

The MCI sum contains all relevant information about the integrand. It can be used for comparing the current configuration against a previous one. If they match, we can skip an actual integration. (Implemented only for the VAMP version.)

There is a random-number generator (its state with associated methods) available as **rng**. It may or may not be used for integration. It will be used for

event generation.

```

<MCI base: public>≡
    public :: mci_t

<MCI base: types>≡
    type, abstract :: mci_t
        integer :: n_dim = 0

  end if
  call msg_message (unit = unit)
end subroutine mci_startup_message

```

Record the index of the MCI object within a process. For multi-component processes with more than one integrator, the integrator should know about its own index, so file names can be unique, etc. The default implementation does nothing, however.

```

<MCI base: mci: TBP>+≡
  procedure :: record_index => mci_record_index
<MCI base: procedures>+≡
  subroutine mci_record_index (mci, i_mci)
    class(mci_t), intent(inout) :: mci
    integer, intent(in) :: i_mci
  end subroutine mci_record_index

```

There is no Initializer for the abstract type, but a generic setter for the number of channels and dimensions. We make two aliases available, to be able to override it.

```

<MCI base: mci: TBP>+≡
  procedure :: set_dimensions => mci_set_dimensions
  procedure :: base_set_dimensions => mci_set_dimensions
<MCI base: procedures>+≡
  subroutine mci_set_dimensions (mci, n_dim, n_channel)
    class(mci_t), intent(inout) :: mci
    integer, intent(in) :: n_dim
    integer, intent(in) :: n_channel
    mci%n_dim = n_dim
    mci%n_channel = n_channel
  end subroutine mci_set_dimensions

```

Declare particular dimensions as flat. This information can be used to simplify integration. When generating events, the flat dimensions should be sampled with uniform and uncorrelated distribution. It depends on the integrator what to do with that information.

```

<MCI base: mci: TBP>+≡
  procedure (mci_declare_flat_dimensions), deferred :: declare_flat_dimensions
<MCI base: interfaces>≡
  abstract interface
    subroutine mci_declare_flat_dimensions (mci, dim_flat)
      import
      class(mci_t), intent(inout) :: mci
      integer, dimension(:), intent(in) :: dim_flat
    end subroutine mci_declare_flat_dimensions
  end interface

```

Declare particular channels as equivalent, possibly allowing for permutations or reflections of dimensions. We use the information stored in the `phs_channel_t` object array that the phase-space module provides.

(We do not test this here, deferring the unit test to the `mci_vamp` implementation where we actually use this feature.)

```

<MCI base: mci: TBP>+≡
  procedure (mci_declare_equivalences), deferred :: declare_equivalences

```

```

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_declare_equivalences (mci, channel, dim_offset)
      import
      class(mci_t), intent(inout) :: mci
      type(phas_channel_t), dimension(:), intent(in) :: channel
      integer, intent(in) :: dim_offset
    end subroutine mci_declare_equivalences
  end interface

```

Declare particular channels as chained together. The implementation may use this array for keeping their weights equal to each other, etc.

The chain array is an array sized by the number of channels. For each channel, there is an integer entry that indicates the corresponding chains. The total number of chains is the maximum value of this entry.

```

<MCI base: mci: TBP>+≡
  procedure :: declare_chains => mci_declare_chains

<MCI base: procedures>+≡
  subroutine mci_declare_chains (mci, chain)
    class(mci_t), intent(inout) :: mci
    integer, dimension(:), intent(in) :: chain
    allocate (mci%chain (size (chain)))
    mci%n_chain = maxval (chain)
    allocate (mci%chain_weights (mci%n_chain), source = 0._default)
    mci%chain = chain
  end subroutine mci_declare_chains

```

Collect channel weights according to chains and store them in the `chain_weights` for output. We sum up the weights for all channels that share the same `chain` index and store the results in the `chain_weights` array.

```

<MCI base: mci: TBP>+≡
  procedure :: collect_chain_weights => mci_collect_chain_weights

<MCI base: procedures>+≡
  subroutine mci_collect_chain_weights (mci, weight)
    class(mci_t), intent(inout) :: mci

end subroutine mci_add_pass

```

Allocate an instance with matching type. This must be deferred.

```

<MCI base: mci: TBP>+≡
    procedure (mci_allocate_instance), deferred :: allocate_instance

<MCI base: interfaces>+≡
    abstract interface
        subroutine mci_allocate_instance (mci, mci_instance)
            import
            class(mci_t), intent(in) :: mci
            class(mci_instance_t), intent(out), pointer :: mci_instance
        end subroutine mci_allocate_instance
    end interface

```

Import a random-number generator. We transfer the allocation of an existing generator state into the object. The generator state may already be initialized, or we can reset it by its `init` method.

```

<MCI base: mci: TBP>+≡
    procedure :: import_rng => mci_import_rng

<MCI base: procedures>+≡
    subroutine mci_import_rng (mci, rng)
        class(mci_t), intent(inout) :: mci
        class(rng_t), intent(inout), allocatable :: rng
        call move_alloc (rng, mci%rng)
    end subroutine mci_import_rng

```

Activate or deactivate the timer.

```

<MCI base: mci: TBP>+≡
    procedure :: set_timer => mci_set_timer

<MCI base: procedures>+≡
    subroutine mci_set_timer (mci, active)
        class(mci_t), intent(inout) :: mci
        logical, intent(in) :: active
        mci%use_timer = active
    end subroutine mci_set_timer

```

Start and stop signal for the timer, if active. The elapsed time can then be retrieved from the MCI record.

```

<MCI base: mci: TBP>+≡
    procedure :: start_timer => mci_start_timer
    procedure :: stop_timer => mci_stop_timer

<MCI base: procedures>+≡
    subroutine mci_start_timer (mci)
        class(mci_t), intent(inout) :: mci
        if (mci%use_timer) call mci%timer%start ()
    end subroutine mci_start_timer

```

```

subroutine mci_stop_timer (mci)
  class(mci_t), intent(inout) :: mci
  if (mci%use_timer) call mci%timer%stop ()
end subroutine mci_stop_timer

```

Sampler test. Evaluate the sampler a given number of times. Results are discarded, so we don't need the MCI instance which would record them.

The evaluation channel is iterated, and the x parameters are randomly chosen.

```

<MCI base: mci: TBP>+=
  procedure :: sampler_test => mci_sampler_test

<MCI base: procedures>+=
  subroutine mci_sampler_test (mci, sampler, n_calls)
    class(mci_t), intent(inout) :: mci
    class(mci_sampler_t), intent(inout), target :: sampler
    integer, intent(in) :: n_calls
    real(default), dimension(:), allocatable :: x_in, f
    real(default), dimension(:,:), allocatable :: x_out
    real(default) :: val
    integer :: i, c
    allocate (x_in (mci%n_dim))
    allocate (f (mci%n_channel))
    allocate (x_out (mci%n_dim, mci%n_channel))
    do i = 1, n_calls
      c = mod (i, mci%n_channel) + 1
      call mci%rng%generate_array (x_in)
      call sampler%evaluate (c, x_in, val, x_out, f)
    end do
  end subroutine mci_sampler_test

```

Integrate: this depends on the implementation. We foresee a pacify flag to take care of small numerical noise on different platforms.

```

<MCI base: mci: TBP>+=
  procedure (mci_integrate), deferred :: integrate

<MCI base: interfaces>+=
  abstract interface
    subroutine mci_integrate (mci, instance, sampler, &
      n_it, n_calls, results, pacify)
      import
      class(mci_t), intent(inout) :: mci
      class(mci_instance_t), intent(inout) :: instance
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: n_it
      integer, intent(in) :: n_calls
      logical, intent(in), optional :: pacify
      class(mci_results_t), intent(inout), optional :: results
    end subroutine mci_integrate
  end interface

```

Event generation. Depending on the implementation, event generation may or may not require a previous integration pass.

Instead of a black-box **simulate** method, we require an initializer, a finalizer, and procedures for generating a single event. This allows us to interface simulation event by event from the outside, and it facilitates the further processing of an event after successful generation. For integration, this is not necessary.

The initializer has **intent(inout)** for the **mci** passed object. The reason is that the initializer can read integration results and grids from file, where the results can modify the **mci** record.

```

<MCI base: mci: TBP>+≡
  procedure (mci_prepare_simulation), deferred :: prepare_simulation
<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_prepare_simulation (mci)
      import
      class(mci_t), intent(inout) :: mci
    end subroutine mci_prepare_simulation
  end interface

```

The generated event will reside in in the **instance** object (overall results and weight) and in the **sampler** object (detailed data). In the real application, we can subsequently call methods of the **sampler** in order to further process the generated event.

The **target** attributes are required by the VAMP implementation, which uses pointers to refer to the instance and sampler objects from within the integration function.

```

<MCI base: mci: TBP>+≡
  procedure (mci_generate), deferred :: generate_weighted_event
  procedure (mci_generate), deferred :: generate_unweighted_event
<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_generate (mci, instance, sampler)
      import
      class(mci_t), intent(inout) :: mci
      class(mci_instance_t), intent(inout), target :: instance
      class(mci_sampler_t), intent(inout), target :: sampler
    end subroutine mci_generate
  end interface

```

This is analogous, but we rebuild the event from the information stored in **state** instead of generating it.

Note: currently unused outside of tests, might be deleted later.

```

<MCI base: mci: TBP>+≡
  procedure (mci_rebuild), deferred :: rebuild_event
<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_rebuild (mci, instance, sampler, state)
      import
      class(mci_t), intent(inout) :: mci
      class(mci_instance_t), intent(inout) :: instance

```

```

        class(mci_sampler_t), intent(inout) :: sampler
        class(mci_state_t), intent(in) :: state
    end subroutine mci_rebuild
end interface

```

    mci_instance%x = 0
  end subroutine mci_instance_base_init

```

Compute the overall weight factor for a configuration of x values and Jacobians f . The x values come in `n_channel` rows with `n_dim` entries each. The f factors constitute an array with `n_channel` entries.

We assume that the x and f arrays are already stored inside the MC instance. The result is also stored there.

```

<MCI base: mci instance: TBP> +=
  procedure (mci_instance_compute_weight), deferred :: compute_weight

<MCI base: interfaces> +=
  abstract interface
    subroutine mci_instance_compute_weight (mci, c)
      import
      class(mci_instance_t), intent(inout) :: mci
      integer, intent(in) :: c
    end subroutine mci_instance_compute_weight
  end interface

```

Record the integrand as returned by the sampler. Depending on the implementation, this may merely copy the value, or do more complicated things.

We may need the MCI weight for the actual computations, so this should be called after the previous routine.

```

<MCI base: mci instance: TBP> +=
  procedure (mci_instance_record_integrand), deferred :: record_integrand

```

```

<MCI base: interfaces>+=
  abstract interface
    subroutine mci_instance_record_integrand (mci, integrand)
      import
      class(mci_instance_t), intent(inout) :: mci
      real(default), intent(in) :: integrand
    end subroutine mci_instance_record_integrand
  end interface

```

Sample a point directly: evaluate the sampler, then compute the weight and the weighted integrand. Finally, record the integrand within the MCI instance.

If a signal (interrupt) was raised recently, we abort the calculation before entering the sampler. Thus, a previous calculation will have completed and any data are already recorded, but any new point can be discarded. If the `abort` flag is present, we may delay the interrupt, so we can do some cleanup.

```

<MCI base: mci instance: TBP>+=
  procedure :: evaluate => mci_instance_evaluate

<MCI base: procedures>+=
  subroutine mci_instance_evaluate (mci, sampler, c, x)
    class(mci_instance_t), intent(inout) :: mci
    class(mci_sampler_t), intent(inout) :: sampler
    integer, intent(in) :: c
    real(default), dimension(:), intent(in) :: x
    real(default) :: val
    call sampler%evaluate (c, x, val, mci%x, mci%f)
    mci%valid = sampler%is_valid ()
    if (mci%valid) then
      call mci%compute_weight (c)
      call mci%record_integrand (val)
    end if
  end subroutine mci_instance_evaluate

```

Initiate and terminate simulation. In contrast to integration, we implement these as methods of the process instance, since the `mci` configuration object is unchanged.

The safety factor reduces the acceptance probability for unweighted events. The implementation of this feature depends on the concrete type.

```

<MCI base: mci instance: TBP>+=
  procedure (mci_instance_init_simulation), deferred :: init_simulation
  procedure (mci_instance_final_simulation), deferred :: final_simulation

<MCI base: interfaces>+=
  abstract interface
    subroutine mci_instance_init_simulation (instance, safety_factor)
      import
      class(mci_instance_t), intent(inout) :: instance
      real(default), intent(in), optional :: safety_factor
    end subroutine mci_instance_init_simulation
  end interface

  abstract interface
    subroutine mci_instance_final_simulation (instance)

```

```

import
class(mci_instance_t), intent(inout) :: instance
end subroutine mci_instance_final_simulation
end interface

```

Assuming that the sampler is in a completely defined state, just extract the data that `evaluate` would compute. Also record the integrand.

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure :: fetch => mci_instance_fetch
⟨MCI base: procedures⟩+≡
  subroutine mci_instance_fetch (mci, sampler, c)
    class(mci_instance_t), intent(inout) :: mci
    class(mci_sampler_t), intent(in) :: sampler
    integer, intent(in) :: c
    real(default) :: val
    mci%valid = sampler%is_valid ()
    if (mci%valid) then
      call sampler%fetch (val, mci%x, mci%f)
      call mci%compute_weight (c)
      call mci%record_integrand (val)
    end if
  end subroutine mci_instance_fetch

```

The value, i.e., the weighted integrand, is the integrand (which should be taken as-is from the sampler) multiplied by the MCI weight.

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure :: get_value => mci_instance_get_value
⟨MCI base: procedures⟩+≡
  function mci_instance_get_value (mci) result (value)
    class(mci_instance_t), intent(in) :: mci
    real(default) :: value
    if (mci%valid) then
      value = mci%integrand * mci%mci_weight
    else
      value = 0
    end if
  end function mci_instance_get_value

```

This is an extra routine. By default, the event weight is equal to the value returned by the previous routine. However, if we select a channel for event generation not just based on the channel weights, the event weight has to account for this bias, so the event weight that applies to event generation is different. In that case, we should override the default routine.

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure :: get_event_weight => mci_instance_get_value

```

Excess weight can occur during unweighted event generation, if the assumed maximum value of the integrand is too small. This excess should be normalized in the same way as the event weight above (which for unweighted events becomes unity).

```

⟨MCI base: mci instance: TBP⟩+≡
  procedure (mci_instance_get_event_excess), deferred :: get_event_excess

```

```

<MCI base: interfaces>+≡
  abstract interface
    function mci_instance_get_event_excess (mci) result (excess)
      import
        class(mci_instance_t), intent(in) :: mci
        real(default) :: excess
    end function mci_instance_get_event_excess
  end interface

```

18.1.3 MCI state

This object can hold the relevant information that allows us to reconstruct the MCI instance without re-evaluating the sampler completely.

We store the `x_in` MC input parameter set, which coincides with the section of the complete `x` array that belongs to a particular channel. We also store the MC function value. When we want to reconstruct the state, we can use the input array to recover the complete `x` and `f` arrays (i.e., the kinematics), but do not need to recompute the MC function value (the dynamics).

The `mci_state_t` may be extended, to allow storing/recalling more information. In that case, we would override the type-bound procedures. However, the base type is also a concrete type and self-contained.

```

<MCI base: public>+≡
  public :: mci_state_t

<MCI base: types>+≡
  type :: mci_state_t
    integer :: selected_channel = 0
    real(default), dimension(:), allocatable :: x_in
    real(default) :: val
  contains
    <MCI base: mci state: TBP>
  end type mci_state_t

```

Output:

```

<MCI base: mci state: TBP>≡
  procedure :: write => mci_state_write

<MCI base: procedures>+≡
  subroutine mci_state_write (object, unit)
    class(mci_state_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)") "MCI state:"
    write (u, "(3x,A,I0)") "Channel   = ", object%selected_channel
    write (u, "(3x,A,999(1x,F12.10))") "x (in)     =", object%x_in
    write (u, "(3x,A,ES19.12)") "Integrand = ", object%val
  end subroutine mci_state_write

```

To store the object, we take the relevant section of the `x` array. The channel used for storing data is taken from the `instance` object, but it could be arbitrary in principle.

```

(MCI base: mci instance: TBP)+≡
  procedure :: store => mci_instance_store

(MCI base: procedures)+≡
  subroutine mci_instance_store (mci, state)
    class(mci_instance_t), intent(in) :: mci
    class(mci_state_t), intent(out) :: state
    state%selected_channel = mci%selected_channel
    allocate (state%x_in (size (mci%x, 1)))
    state%x_in = mci%x(:,mci%selected_channel)
    state%val = mci%integrand
  end subroutine mci_instance_store

```

Recalling the state, we must consult the sampler in order to fully reconstruct the `x` and `f` arrays. The integrand value is known, and we also give it to the sampler, bypassing evaluation.

The final steps are equivalent to the `evaluate` method above.

```

(MCI base: mci instance: TBP)+≡
  procedure :: recall => mci_instance_recall

(MCI base: procedures)+≡
  subroutine mci_instance_recall (mci, sampler, state)
    class(mci_instance_t), intent(inout) :: mci
    class(mci_sampler_t), intent(inout) :: sampler
    class(mci_state_t), intent(in) :: state
    if (size (state%x_in) == size (mci%x, 1) &
        .and. state%selected_channel <= size (mci%x, 2)) then
      call sampler%rebuild (state%selected_channel, &
        state%x_in, state%val, mci%x, mci%f)
      call mci%compute_weight (state%selected_channel)
      call mci%record_integrand (state%val)
    else
      call msg_fatal ("Recalling event: mismatch in channel or dimension")
    end if
  end subroutine mci_instance_recall

```

18.1.4 MCI sampler

A sampler is an object that implements a multi-channel parameterization of the unit hypercube. Specifically, it is able to compute, given a channel and a set of x MC parameter values, a the complete set of x values and associated Jacobian factors f for all channels.

Furthermore, the sampler should return a single real value, the integrand, for the given point in the hypercube.

It must implement a method `evaluate` for performing the above computations.

```

(MCI base: public)+≡
  public :: mci_sampler_t

```

```

<MCI base: types>+≡
  type, abstract :: mci_sampler_t
  contains
    <MCI base: mci_sampler: TBP>
  end type mci_sampler_t

```

Output, deferred to the implementation.

```

<MCI base: mci_sampler: TBP>≡
  procedure (mci_sampler_write), deferred :: write

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_write (object, unit, testflag)
      import
      class(mci_sampler_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: testflag
    end subroutine mci_sampler_write
  end interface

```

The evaluation routine. Input is the channel index *c* and the one-dimensional parameter array *x_in*. Output are the integrand value *val*, the two-dimensional parameter array *x* and the Jacobian array *f*.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_evaluate), deferred :: evaluate

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_evaluate (sampler, c, x_in, val, x, f)
      import
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(out) :: val
      real(default), dimension(:, :), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_evaluate
  end interface

```

Query the validity of the sampling point. Can be called after *evaluate*.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_is_valid), deferred :: is_valid

<MCI base: interfaces>+≡
  abstract interface
    function mci_sampler_is_valid (sampler) result (valid)
      import
      class(mci_sampler_t), intent(in) :: sampler
      logical :: valid
    end function mci_sampler_is_valid
  end interface

```

The shortcut. Again, the channel index `c` and the parameter array `x_in` are input. However, we also provide the integrand value `val`, and we just require that the complete parameter array `x` and Jacobian array `f` are recovered.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_rebuild), deferred :: rebuild

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_rebuild (sampler, c, x_in, val, x, f)
      import
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(in) :: val
      real(default), dimension(:, :), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_rebuild
  end interface

```

This routine should extract the important data from a sampler that has been filled by other means. We fetch the integrand value `val`, the two-dimensional parameter array `x` and the Jacobian array `f`.

```

<MCI base: mci_sampler: TBP>+≡
  procedure (mci_sampler_fetch), deferred :: fetch

<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_sampler_fetch (sampler, val, x, f)
      import
      class(mci_sampler_t), intent(in) :: sampler
      real(default), intent(out) :: val
      real(default), dimension(:, :), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
    end subroutine mci_sampler_fetch
  end interface

```

18.1.5 Results record

This is an abstract type which allows us to implement callback: each integration results can optionally be recorded to an instance of this object. The actual object may store a new result, average results, etc. It may also display a result on-line or otherwise, whenever the `record` method is called.

```

<MCI base: public>+≡
  public :: mci_results_t

<MCI base: types>+≡
  type, abstract :: mci_results_t
    contains
    <MCI base: mci_results: TBP>
  end type mci_results_t

```

The output routine is deferred. We provide an extra `verbose` flag, which could serve any purpose.

```

<MCI base: mci_results: TBP>≡
  procedure (mci_results_write), deferred :: write
<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_results_write (object, unit, verbose, suppress)
      import
      class(mci_results_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose, suppress
    end subroutine mci_results_write
  end interface

```

This is the `record` method, which can be called directly from the integrator.

```

<MCI base: mci_results: TBP>+≡
  procedure (mci_results_record), deferred :: record
<MCI base: interfaces>+≡
  abstract interface
    subroutine mci_results_record (object, n_it, &
      n_calls, integral, error, efficiency, chain_weights, suppress)
      import
      class(mci_results_t), intent(inout) :: object
      integer, intent(in) :: n_it
      integer, intent(in) :: n_calls
      real(default), intent(in) :: integral
      real(default), intent(in) :: error
      real(default), intent(in) :: efficiency
      real(default), dimension(:), intent(in), optional :: chain_weights
      logical, intent(in), optional :: suppress
    end subroutine mci_results_record
  end interface

```

18.1.6 Unit tests

```

<MCI base: public>+≡
  public :: mci_base_test
<MCI base: tests>≡
  subroutine mci_base_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <MCI base: execute tests>
  end subroutine mci_base_test

```

Test implementation of the configuration type

The concrete type contains the number of requested calls and the integral result, to be determined.

The `max_factor` entry is set for the actual test integration, where the integrand is not unity but some other constant value. This value should be set here, such that the actual maximum of the integrand is known when vetoing unweighted events.

```

<MCI base: public>+≡
    public :: mci_test_t

<MCI base: test types>≡
    type, extends (mci_t) :: mci_test_t
        integer :: divisions = 0
        integer :: tries = 0
        real(default) :: max_factor = 1
    contains
        procedure :: final => mci_test_final
        procedure :: write => mci_test_write
        procedure :: startup_message => mci_test_startup_message
        procedure :: declare_flat_dimensions => mci_test_ignore_flat_dimensions
        procedure :: declare_equivalences => mci_test_ignore_equivalences
        procedure :: set_divisions => mci_test_set_divisions
        procedure :: set_max_factor => mci_test_set_max_factor
        procedure :: allocate_instance => mci_test_allocate_instance
        procedure :: integrate => mci_test_integrate
        procedure :: prepare_simulation => mci_test_ignore_prepare_simulation
        procedure :: generate_weighted_event => mci_test_generate_weighted_event
        procedure :: generate_unweighted_event => &
            mci_test_generate_unweighted_event
        procedure :: rebuild_event => mci_test_rebuild_event
    end type mci_test_t

```

Finalizer: base version is sufficient

```

<MCI base: tests>+≡
    subroutine mci_test_final (object)
        class(mci_test_t), intent(inout) :: object
        call object%base_final ()
    end subroutine mci_test_final

```

Output: trivial

```

<MCI base: tests>+≡
    subroutine mci_test_write (object, unit, pacify, md5sum_version)
        class(mci_test_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: pacify
        logical, intent(in), optional :: md5sum_version
        integer :: u
        u = given_output_unit (unit)
        write (u, "(1x,A)") "Test integrator:"
        call object%base_write (u, pacify, md5sum_version)
        if (object%divisions /= 0) then
            write (u, "(3x,A,I0)") "Number of divisions = ", object%divisions
        end if
        if (allocated (object%rng)) call object%rng%write (u)
    end subroutine mci_test_write

```

Short version.

```
<MCI base: tests>+≡
subroutine mci_test_startup_message (mci, unit, n_calls)
  class(mci_test_t), intent(in) :: mci
  integer, intent(in), optional :: unit, n_calls
  call mci%base_startup_message (unit = unit, n_calls = n_calls)

    call instance%recall (sampler, state)
  end select
end subroutine mci_test_rebuild_event

```

Instance of the test MCI type

This instance type simulates the VAMP approach. We implement the VAMP multi-channel formula, but keep the channel-specific probability functions g_i smooth and fixed. We also keep the weights fixed.

The setup is as follows: we have n mappings of the unit hypercube

$$x = x(x^{(k)}) \quad \text{where } x = (x_1, \dots). \quad (18.1)$$

The Jacobian factors are the determinants

$$f^{(k)}(x^{(k)}) = \left| \frac{\partial x}{\partial x^{(k)}} \right| \quad (18.2)$$

We introduce arbitrary probability functions

$$g^{(k)}(x^{(k)}) \quad \text{with} \quad \int dx^{(k)} g^{(k)}(x^{(k)}) = 1 \quad (18.3)$$

and weights

$$w_k \quad \text{with} \quad \sum_k w_k = 1 \quad (18.4)$$

and construct the joint probability function

$$g(x) = \sum_k w_k \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \quad (18.5)$$

which also satisfies

$$\int g(x) dx = 1. \quad (18.6)$$

The algorithm implements a resolution of unity as follows

$$\begin{aligned} 1 &= \int dx = \int \frac{g(x)}{g(x)} dx \\ &= \sum w_k \int \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \frac{dx}{g(x)} \\ &= \sum w_k \int g^{(k)}(x^{(k)}) \frac{dx^{(k)}}{g(x(x^{(k)}))} \end{aligned} \quad (18.7)$$

where each of the integrals in the sum is evaluated using the channel-specific variables $x^{(k)}$.

We provide two examples: (1) trivial with one channel, one dimension, and all functions unity and (2) two channels and two dimensions with

$$\begin{aligned} x(x^{(1)}) &= (x_1^{(1)}, x_2^{(1)}) \\ x(x^{(2)}) &= (x_1^{(2)2}, x_2^{(2)}) \end{aligned} \quad (18.8)$$

hence

$$f^{(1)} \equiv 1, \quad f^{(2)}(x^{(2)}) = 2x_1^{(2)} \quad (18.9)$$

The probability functions are

$$g^{(1)} \equiv 1, \quad g^{(2)}(x^{(2)}) = 2x_2^{(2)} \quad (18.10)$$

In the concrete implementation of the integrator instance we store values for the channel probabilities g_i and the accumulated probability g .

We also store the result (product of integrand and MCI weight), the expected maximum for the result in each channel.

Test sampler

The test sampler implements a fixed configuration, either trivial (one-channel, one-dimension), or slightly nontrivial (two-channel, two-dimension). In the second channel, the first parameter is mapped according to $x_1 = x_1^{(2)2}$, so we have $f^{(2)}(x^{(2)}) = 2x_1^{(2)}$.

For display purposes, we store the return values inside the object. This is not strictly necessary.

18.2 Iterations

This module defines a container for the list of iterations and calls, to be submitted to integration.

```

<iterations.f90>≡
  <File header>

  module iterations

    <Use strings>
    use io_units
    use unit_tests
    use diagnostics

    <Standard module head>

    <Iterations: public>

    <Iterations: types>

    contains

    <Iterations: procedures>

    <Iterations: tests>

  end module iterations

```

18.2.1 The iterations list

Each integration pass has a number of iterations and a number of calls per iteration. The last pass produces the end result; the previous passes are used for adaptation.

The flags `adapt_grid` and `adapt_weight` are used only if `custom_adaptation` is set. Otherwise, default settings are used that depend on the integration pass.

```

<Iterations: types>≡
  type :: iterations_spec_t
    private

```

```

integer :: n_it = 0
integer :: n_calls = 0
logical :: custom_adaptation = .false.
logical :: adapt_grids = .false.
logical :: adapt_weights = .false.
end type iterations_spec_t

```

We build up a list of iterations.

```

<Iterations: public>≡
  public :: iterations_list_t

<Iterations: types>+≡
  type :: iterations_list_t
  private
  integer :: n_pass = 0
  type(iterations_spec_t), dimension(:), allocatable :: pass
  contains
  <Iterations: iterations list: TBP>
end type iterations_list_t

```

Initialize an iterations list. For each pass, we have to specify the number of iterations and calls. We may provide the adaption conventions explicitly, either as character codes or as logicals.

For passes where the adaptation conventions are not specified, we use the following default setting: adapt weights and grids for all passes except the last one.

```

<Iterations: iterations list: TBP>≡
  procedure :: init => iterations_list_init

<Iterations: procedures>≡
  subroutine iterations_list_init &
    (it_list, n_it, n_calls, adapt, adapt_code, adapt_grids, adapt_weights)
    class(iterations_list_t), intent(inout) :: it_list
    integer, dimension(:), intent(in) :: n_it, n_calls
    logical, dimension(:), intent(in), optional :: adapt
    type(string_t), dimension(:), intent(in), optional :: adapt_code
    logical, dimension(:), intent(in), optional :: adapt_grids, adapt_weights
    integer :: i
    it_list%n_pass = size (n_it)
    if (allocated (it_list%pass)) deallocate (it_list%pass)
    allocate (it_list%pass (it_list%n_pass))
    it_list%pass%n_it = n_it
    it_list%pass%n_calls = n_calls
    if (present (adapt)) then
      it_list%pass%custom_adaptation = adapt
      do i = 1, it_list%n_pass
        if (adapt(i)) then
          if (verify (adapt_code(i), "wg") /= 0) then
            call msg_error ("iteration specification: " &
              // "adaptation code letters must be 'w' or 'g'")
          end if
          it_list%pass(i)%adapt_grids = scan (adapt_code(i), "g") /= 0
          it_list%pass(i)%adapt_weights = scan (adapt_code(i), "w") /= 0
        end if
      end do
    end if
  end subroutine iterations_list_init

```

```

        end if
    end do
    else if (present (adapt_grids) .and. present (adapt_weights)) then
        it_list%pass%custom_adaptation = .true.
        it_list%pass%adapt_grids = adapt_grids

write (u, "(A)")  "* Test output end: iterations_2"

end subroutine iterations_2

```

18.3 Integration results

We record integration results and errors in a dedicated type. This allows us to do further statistics such as weighted average, chi-squared, grouping by integration passes, etc.

Note WHIZARD 2.2.0: This code is taken from the previous `processes` module essentially unchanged and converted into a separate module. It lacks an overhaul and, in particular, self-tests.

```

<integration_results.f90>≡
module integration_results

  <Use kinds>
  <Use strings>
  use io_units
  use format_utils, only: mp_format, pac_fmt
  use format_defs, only: FMT_10, FMT_14
  use diagnostics
  use md5
  use os_interface
  use mci_base

  <Standard module head>

  <Integration results: public>

  <Integration results: parameters>

  <Integration results: types>

contains

  <Integration results: procedures>

```

```
end module integration_results
```

18.3.1 Integration results entry

This object collects the results of an integration pass and makes them available to the outside.

The results object has to distinguish the process type:

We store the process type, the index of the integration pass and the absolute iteration index, the number of iterations contained in this result (for averages), and the integral (cross section or partial width), error estimate, efficiency.

For intermediate results, we set a flag if this result is an improvement w.r.t. previous ones.

The process type indicates decay or scattering. Dummy entries (skipped iterations) have a process type of PRC_UNKNOWN.

<Integration results: types>≡

```
type :: integration_entry_t
private
integer :: process_type = PRC_UNKNOWN
integer :: pass = 0
integer :: it = 0
integer :: n_it = 0
integer :: n_calls = 0
logical :: improved = .false.
real(default) :: integral = 0
real(default) :: error = 0
real(default) :: efficiency = 0
real(default) :: chi2 = 0
real(default), dimension(:), allocatable :: chain_weights
end type integration_entry_t
```

The possible values of the type indicator:

<Integration results: parameters>≡

```
integer, parameter, public :: PRC_UNKNOWN = 0
integer, parameter, public :: PRC_DECAY = 1

Output. This writes the header line for the result account below:

```

(Integration results: procedures) +=
  subroutine write_header (process_type, unit, logfile)
    integer, intent(in) :: process_type
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: logfile
    character(5) :: phys_unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    select case (process_type)
    case (PRC_DECAY);      phys_unit = "[GeV]"
    case (PRC_SCATTERING); phys_unit = "[fb] "
    case default
      phys_unit = ""
    end select
  end subroutine

```

```

end select
write (msg_buffer, "(A)") &
    "It      Calls  Integral" // phys_unit // &
    " Error" // phys_unit // &
    " Err[%]   Acc  Eff[%]   Chi2 N[It] |"
call msg_message (unit=u, logfile=logfile)
end subroutine write_header

```

This writes a separator for result display:

```

<Integration results: procedures>+≡
subroutine write_hline (unit)
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(A)")  "|" // (repeat("-", 77)) // "|"
    flush (u)
end subroutine write_hline

subroutine write_dline (unit)
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(A)")  "|" // (repeat("=", 77)) // "|"
    flush (u)
end subroutine write_dline

```

This writes the standard result account into one screen line. The verbose version uses multiple lines and prints the unabridged values. Dummy entries are not written.

        end do
        write (u, *)
    end if
end subroutine integration_entry_write_chain_weights

```

Compute the average for all entries in the specified integration pass. The integrals are weighted w.r.t. their individual errors.

The quoted error of the result is the expected error, computed from the weighted average of the given individual errors.

This should be compared to the actual distribution of the results, from which we also can compute an error estimate if there is more than one iteration. The ratio of the distribution error and the averaged error, is the χ^2 value.

All error distributions are assumed Gaussian, of course. The χ^2 value is a partial check for this assumption. If it is significantly greater than unity, there is something wrong with the individual errors.

The efficiency returned is the one of the last entry in the integration pass.

If any error vanishes, averaging by this algorithm would fail. In this case, we simply average the entries and use the deviations from this average (if any) to estimate the error.

(Integration results: procedures)+≡

```

```

18.3.2 Combined integration results

We collect a list of results which grows during the execution of the program. This is implemented as an array which grows if necessary; so we can easily compute averages.

We implement this as an extension of the `mci_results_t` which is defined in `mci_base` as an abstract type. We thus decouple the implementation of the integrator from the implementation of the results display, but nevertheless can record intermediate results during integration. This implies that the present extension implements a `record` method.

```
<Integration results: public>≡
    public :: integration_results_t
<Integration results: types>+≡
    type, extends (mci_results_t) :: integration_results_t
        private
            integer :: process_type = PRC_UNKNOWN
            integer :: current_pass = 0
            integer :: n_pass = 0
            integer :: n_it = 0
            logical :: screen = .false.
            integer :: unit = 0
            real(default) :: error_threshold = 0
            type(integration_entry_t), dimension(:), allocatable :: entry
            type(integration_entry_t), dimension(:), allocatable :: average
        contains
            <Integration results: integration results: TBP>
        end type integration_results_t
```

The array is extended in chunks of 10 entries.

```
<Integration results: parameters>+≡
    integer, parameter :: RESULTS_CHUNK_SIZE = 10
```

The standard does not require to explicitly initialize the integers; however, some gfortran version has a bug here and misses the default initialization in the type definition.

```
<Integration results: integration results: TBP>≡
    procedure :: init => integration_results_init
<Integration results: procedures>+≡
    subroutine integration_results_init (results, process_type)
        class(integration_results_t), intent(out) :: results
        integer, intent(in) :: process_type
        results%process_type = process_type
        results%n_pass = 0
        results%n_it = 0
        allocate (results%entry (RESULTS_CHUNK_SIZE))
        allocate (results%average (RESULTS_CHUNK_SIZE))
    end subroutine integration_results_init
```

Set additional parameters: the `error_threshold` declares that any error value (in absolute numbers) smaller than this is to be considered zero.

```
<Integration results: integration results: TBP>+≡
```

```

    procedure :: set_error_threshold => integration_results_set_error_threshold
  <Integration results: procedures>+≡
    subroutine integration_results_set_error_threshold (results, error_threshold)
      class(integration_results_t), intent(inout) :: results
      real(default), intent(in) :: error_threshold
      results%error_threshold = error_threshold
    end subroutine integration_results_set_error_threshold

```

Output (ASCII format). The verbose format is used for writing the header in grid files.

```

end if
write (u, *) "end(integration_results)"
end if
flush (u)
end subroutine integration_results_write

```

During integration, we do not want to print all results at once, but each intermediate result as soon as we get it. Thus, the previous procedure is chopped in pieces. First piece: store the output unit and a flag whether we want to print to standard output as well. Then write the header if the results are still empty, i.e., before integration has started. The second piece writes a single result to the saved output channels. We call this from the `record` method, which can be called from the integrator directly. The third piece writes the average result, once a pass has been completed. The fourth piece writes a footer (if any), assuming that this is the final result.

Chapter 19

User Code Interface

Here we collect interface code that enables the user to inject his own code into the WHIZARD workflow. The code uses data types defined above, and is referenced in the `eval_trees` module.

```
<user_code_interface.f90>≡  
  <File header>  
  
  module user_code_interface  
  
    use iso_c_binding !NODEP!  
    <Use kinds>  
    <Use strings>  
    use diagnostics  
    use c_particles  
    use os_interface  
  
    <Standard module head>  
  
    <User Code: public>  
  
    <User Code: variables>  
  
    <User Code: interfaces>  
  
    contains  
  
    <User Code: procedures>  
  
  end module user_code_interface
```

19.0.5 User Code Management

This data structure globally holds the filehandle of the user-code library:

```
<User Code: public>≡  
  public :: has_user_lib  
  
<User Code: variables>≡  
  type(dlaccess_t), save :: user_lib_handle
```

```

logical, save :: has_user_lib = .false.
type(string_t), save :: user

```

Compile, link and load user code files. Dlopen all user-provided libraries, included the one just compiled (if any).

By default, we are looking for a library `user.so/dylib`. If this is not present, try `user.f90` and compile it. This can be overridden.

In detail: First, compile all sources explicitly specified on the command line. Then collect all libraries specified on the command line, including `user.so` if it was generated. If there is still no code, check for an existing `user.f90` and compile this. Link everything into a `user.la` libtool library. When done, dlopen all libraries that we have so far.

```

<User Code: public>+=
  public :: user_code_init

<User Code: procedures>=
  subroutine user_code_init (user_src, user_lib, user_target, rebuild, os_data)
    type(string_t), dimension(:), intent(in) :: user_src, user_lib

```

19.0.6 Interfaces for user-defined functions

The following functions represent user-defined real observables. There may be one or two particles as argument, the result is a real value.

```
<User Code: public>+≡
  public :: user_obs_int_unary
  public :: user_obs_int_binary
  public :: user_obs_real_unary
  public :: user_obs_real_binary

<User Code: interfaces>≡
  abstract interface
    function user_obs_int_unary (prt1) result (ival) bind(C)
      use iso_c_binding !NODEP!
      use c_particles !NODEP!
      type(c_prt_t), intent(in) :: prt1
      integer(c_int) :: ival
    end function user_obs_int_unary
  end interface

  abstract interface
    function user_obs_int_binary (prt1, prt2) result (ival) bind(C)
      use iso_c_binding !NODEP!
      use c_particles !NODEP!
      type(c_prt_t), intent(in) :: prt1, prt2
      integer(c_int) :: ival
    end function user_obs_int_binary
  end interface

  abstract interface
    function user_obs_real_unary (prt1) result (rval) bind(C)
      use iso_c_binding !NODEP!
      use c_particles !NODEP!
      type(c_prt_t), intent(in) :: prt1
      real(c_double) :: rval
    end function user_obs_real_unary
  end interface

  abstract interface
    function user_obs_real_binary (prt1, prt2) result (rval) bind(C)
      use iso_c_binding !NODEP!
      use c_particles !NODEP!
      type(c_prt_t), intent(in) :: prt1, prt2
      real(c_double) :: rval
    end function user_obs_real_binary
  end interface
```

The following function takes an array of C-compatible particles and return a single value. The particle array represents a subevent. For C interoperability, we have to use an assumed-size array, hence the array size has to be transferred explicitly.

The cut function returns an `int`, which we should interpret as a logical value (nonzero=true).

```

<User Code: public>+≡
    public :: user_cut_fun

<User Code: interfaces>+≡
    abstract interface
        function user_cut_fun (prt, n_prt) result (iflag) bind(C)
            use iso_c_binding !NODEP!
            use c_particles !NODEP!
            type(c_prt_t), dimension(*), intent(in) :: prt
            integer(c_int), intent(in) :: n_prt
            integer(c_int) :: iflag
        end function user_cut_fun
    end interface

```

The event-shape function returns a real value.

```

<User Code: public>+≡
    public :: user_event_shape_fun

<User Code: interfaces>+≡
    abstract interface
        function user_event_shape_fun (prt, n_prt) result (rval) bind(C)
            use iso_c_binding !NODEP!
            use c_particles !NODEP!
            type(c_prt_t), dimension(*), intent(in) :: prt
            integer(c_int), intent(in) :: n_prt
            real(c_double) :: rval
        end function user_event_shape_fun
    end interface

```

19.0.7 Interfaces for user-defined interactions

The following procedure interfaces pertain to user-defined interactions, e.g., spectra or structure functions.

This subroutine retrieves the basic information for setting up the interaction and event generation. All parameters are `intent(inout)`, so we can provide default values. `n_in` and `n_out` are the number of incoming and outgoing particles, respectively. `n_states` is the total number of distinct states that should be generated (counting all states of the incoming particles). `n_col` is the maximal number of color entries a particle can have. `n_dim` is the number of input parameters, i.e., integration dimensions, that the structure function call requires for computing kinematics and matrix elements. `n_var` is the number of variables (e.g., momentum fractions) that the structure function call has to transfer from the kinematics to the dynamics evaluation.

```

<User Code: public>+≡
    public :: user_int_info

<User Code: interfaces>+≡
    abstract interface
        subroutine user_int_info (n_in, n_out, n_states, n_col, n_dim, n_var) &
            bind(C)

```

```

        use iso_c_binding !NODEP!
        integer(c_int), intent(inout) :: n_in, n_out, n_states, n_col
        integer(c_int), intent(inout) :: n_dim, n_var
    end subroutine user_int_info
end interface

```

This subroutine retrieves the settings for the quantum number mask of a given particle index in the interaction. A nonzero value indicates that the corresponding quantum number is to be ignored. The lock index is the index of a particle that the current particle is related to. The relation applies if quantum numbers of one of the locked particles are summed over. (This is intended for helicity.)

```

<User Code: public>+≡
    public :: user_int_mask

<User Code: interfaces>+≡
    abstract interface
        subroutine user_int_mask (i_prt, m_flv, m_hel, m_col, i_lock) bind(C)
            use iso_c_binding !NODEP!
            integer(c_int), intent(in) :: i_prt
            integer(c_int), intent(inout) :: m_flv, m_hel, m_col, i_lock
        end subroutine user_int_mask
    end interface

```

This subroutine retrieves the quantum numbers for the particle index `i_prt` in state `i_state`. The `flv` value is a PDG code. The `hel` value is an integer helicity (twice the helicity for fermions). The `col` array is an array which has at most `n_col` entries (see above). All parameters are `intent(inout)` since default values exist. In particular, if a mask entry is set by the previous procedure, the corresponding quantum number is ignored anyway.

```

<User Code: public>+≡
    public :: user_int_state

<User Code: interfaces>+≡
    abstract interface
        subroutine user_int_state (i_state, i_prt, flv, hel, col) bind(C)
            use iso_c_binding !NODEP!
            integer(c_int), intent(in) :: i_state, i_prt
            integer(c_int), intent(inout) :: flv, hel
            integer(c_int), dimension(*), intent(inout) :: col
        end subroutine user_int_state
    end interface

```

This subroutine takes an array of particle objects with array length `n_in` and an array of input parameters between 0 and 1 with array length `n_dim`. It returns an array of particle objects with array length `n_out`. In addition, it returns an array of internal variables (e.g., momentum fractions, Jacobian) with array length `n_var` that is used by the following subroutine for evaluating the dynamics, i.e., the matrix elements.

```

<User Code: public>+≡
    public :: user_int_kinematics

```

```

<User Code: interfaces>+≡
  abstract interface
    subroutine user_int_kinematics (prt_in, rval, prt_out, xval) bind(C)
      use iso_c_binding !NODEP!
      use c_particles !NODEP!
      type(c_prt_t), dimension(*), intent(in) :: prt_in
      real(c_double), dimension(*), intent(in) :: rval
      type(c_prt_t), dimension(*), intent(inout) :: prt_out
      real(c_double), dimension(*), intent(out) :: xval
    end subroutine user_int_kinematics
  end interface

```

This subroutine takes the array of variables (e.g., momentum fractions) with length `n_var` which has been generated by the previous subroutine and a real variable, the energy scale of the event. It returns an array of matrix-element values, one entry for each quantum state `n_states`. The ordering of matrix elements must correspond to the ordering of states.

```

<User Code: public>+≡
  public :: user_int_evaluate

<User Code: interfaces>+≡
  abstract interface
    subroutine user_int_evaluate (xval, scale, fval) bind(C)
      use iso_c_binding !NODEP!
      real(c_double), dimension(*), intent(in) :: xval
      real(c_double), intent(in) :: scale
      real(c_double), dimension(*), intent(out) :: fval
    end subroutine user_int_evaluate
  end interface

```

Chapter 20

Sindarin Base

This part contains the basic internal structures of Sindarin: variables and expressions.

eval_trees Expressions of values of all kinds, represented in a tree structure. This provides an implementation of the **expr_base** abstract type.

20.1 Expressions as Eval Trees

In this module we define the structures needed to parse a user-defined expression, to compile it into an evaluation tree, and to evaluate it.

We have two flavors of expressions: one with particles and one without particles. The latter version is used for defining cut/selection criteria and for online analysis.

```
<eval_trees.f90>≡  
  <File header>  
  
  module eval_trees  
  
    use, intrinsic :: iso_c_binding !NODEP!  
    <Use kinds>  
    <Use strings>  
    use io_units  
    use constants  
    use format_defs, only: FMT_19  
    use unit_tests  
    use diagnostics  
    use lorentz  
    use md5  
    use formats  
    use sorting  
    use ifiles  
    use lexers  
    use syntax_rules  
    use parser  
    use analysis  
    use jets
```

```

    use pdg_arrays
    use subevents
    use user_code_interface
    use variables
    use expr_base

    contains

    <Eval trees: procedures>

    <Eval trees: tests>

    end module eval_trees

```

20.1.1 Tree nodes

The evaluation tree consists of branch nodes (unary and binary) and of leaf nodes, originating from a common root. The node object should be polymorphic. For the time being, polymorphism is emulated here. This means that we have to maintain all possibilities that the node may hold, including associated procedures as pointers.

The following parameter values characterize the node. Unary and binary operators have sub-nodes. The other are leaf nodes. Possible leafs are literal constants or named-parameter references.

```

<Eval trees: types>≡
    integer, parameter :: EN_UNKNOWN = 0, EN_UNARY = 1, EN_BINARY = 2
    integer, parameter :: EN_CONSTANT = 3, EN_VARIABLE = 4
    integer, parameter :: EN_CONDITIONAL = 5, EN_BLOCK = 6
    integer, parameter :: EN_RECORD_CMD = 7
    integer, parameter :: EN_OBS1_INT = 11, EN_OBS2_INT = 12
    integer, parameter :: EN_OBS1_REAL = 21, EN_OBS2_REAL = 22
    integer, parameter :: EN_UOBS1_INT = 31, EN_UOBS2_INT = 32
    integer, parameter :: EN_UOBS1_REAL = 41, EN_UOBS2_REAL = 42
    integer, parameter :: EN_PRT_FUN_UNARY = 101, EN_PRT_FUN_BINARY = 102
    integer, parameter :: EN_EVAL_FUN_UNARY = 111, EN_EVAL_FUN_BINARY = 112

  end select
end subroutine eval_node_init_obs

```

Initialize a block node which contains, in addition to the expression to be evaluated, a variable definition. The result type is not yet assigned, because we can compile the enclosed expression only after the var list is set up.

Note that the node always allocates a new variable list and appends it to the current one. Thus, if the variable redefines an existing one, it only shadows it but does not reset it. Any side-effects are therefore absent and need not be undone outside the block.

If the flag **new** is set, a variable is (re)declared. This must not be done for intrinsic variables. Vice versa, if the variable is not existent, the **new** flag is required.

(Eval trees: procedures)+≡

```

subroutine eval_node_init_block (node, name, type, var_def, var_list)
  type(eval_node_t), intent(out), target :: node
  type(string_t), intent(in) :: name

end if
end subroutine eval_node_init_block

```

Complete block initialization by assigning the expression to evaluate to `arg0`.

<Eval trees: procedures>+≡

```

subroutine eval_node_set_expr (node, arg, result_type)
    type(eval_node_t), intent(inout) :: node
    type(eval_node_t), intent(in), target :: arg
    integer, intent(in), optional :: result_type
    if (present (result_type)) then
        node%result_type = result_type
    else
        node%result_type = arg%result_type
    end if
    call eval_node_allocate_value (node)
    node%arg0 => arg
end subroutine eval_node_set_expr

```

Initialize a conditional. There are three branches: the condition (evaluates to logical) and the two alternatives (evaluate both to the same arbitrary type).

<Eval trees: procedures>+≡

```

subroutine eval_node_init_conditional (node, result_type, cond, arg1, arg2)
    type(eval_node_t), intent(out) :: node
    integer, intent(in) :: result_type
    type(eval_node_t), intent(in), target :: cond, arg1, arg2
    node%type = EN_CONDITIONAL
    node%tag = "cond"
    node%result_type = result_type
    call eval_node_allocate_value (node)
    node%arg0 => cond
    node%arg1 => arg1
    node%arg2 => arg2
end subroutine eval_node_init_conditional

```

Initialize a recording command (which evaluates to a logical constant). The first branch is the ID of the analysis object to be filled, the optional branches 1 to 4 are the values to be recorded.

If the event-weight pointer is null, we record values with unit weight. Otherwise, we use the value pointed to as event weight.

There can be up to four arguments which represent x , y , Δy , Δx . Therefore, this is the only node type that may fill four sub-nodes.

<Eval trees: procedures>+≡

```

subroutine eval_node_init_record_cmd &
    (node, event_weight, id, arg1, arg2, arg3, arg4)
    type(eval_node_t), intent(out) :: node

```

```

real(default), pointer :: event_weight
type(eval_node_t), intent(in), target :: id
type(eval_node_t), intent(in), optional, target :: arg1, arg2, arg3, arg4
call eval_node_init_log (node, .true.)
node%type = EN_RECORD_CMD
node%rval => event_weight
node%tag = "record_cmd"
node%arg0 => id
if (present (arg1)) then
  node%arg1 => arg1
  if (present (arg2)) then
    node%arg2 => arg2
    if (present (arg3)) then
      node%arg3 => arg3
      if (present (arg4)) then
        node%arg4 => arg4
      end if
    end if
  end if
end if
end if
end subroutine eval_node_init_record_cmd

```

Initialize a node for operations on subevents. The particle lists (one or two) are inserted as `arg1` and `arg2`. We allocated particle pointers as temporaries for iterating over particle lists. The procedure pointer which holds the function to evaluate for the subevents (e.g., combine, select) is also initialized.

(Eval trees: procedures)+≡

```

  node%arg0 => fmt
  node%arg1 => arg
  allocate (node%ival)
  node%ival = n_args
end subroutine eval_node_init_format_string

```

If particle functions depend upon a condition (or an expression is evaluated), the observables that can be evaluated for the given particles have to be thrown on the local variable stack. This is done here. Each observable is initialized with the particle pointers which have been allocated for the node.

The integer variable that is referred to by the Index pseudo-observable is always known when it is referred to.

```

<Eval trees: procedures>+≡
subroutine eval_node_set_observables (node, var_list)
  type(eval_node_t), intent(inout) :: node
  type(var_list_t), intent(in), target :: var_list
  logical, save, target :: known = .true.
  allocate (node%var_list)
  call var_list_link (node%var_list, var_list)
  allocate (node%index, source = 0)
  call var_list_append_int_ptr &
    (node%var_list, var_str ("Index"), node%index, known, intrinsic=.true.)
  if (.not. associated (node%prt2)) then
    call var_list_set_observables_unary &
      (node%var_list, node%prt1)
  else
    call var_list_set_observables_binary &
      (node%var_list, node%prt1, node%prt2)
  end if
end subroutine eval_node_set_observables

```

Output

```

20.1.2 Operation types

For the operations associated to evaluation tree nodes, we define abstract interfaces for all cases.

Particles/subevents are transferred by-reference, to avoid unnecessary copying. Therefore, subroutines instead of functions. (Furthermore, the function version of `unary_prt` triggers an obscure bug in nagfor 5.2(649) [invalid C code].)

(Eval trees: interfaces)≡

```

abstract interface
    logical function unary_log (arg)
        import eval_node_t
        type(eval_node_t), intent(in) :: arg
    end function unary_log
end interface
abstract interface

20.1.3 Specific operators

Our expression syntax contains all Fortran functions that make sense. These functions have to be provided in a form that they can be used in procedures pointers, and have the abstract interfaces above. For some intrinsic functions, we could use specific versions provided by Fortran directly. However, this has two drawbacks: (i) We should work with the values instead of the eval-nodes as argument, which complicates the interface; (ii) more importantly, the **default** real type need not be equivalent to double precision. This would, at least, introduce system dependencies. Finally, for operators there are no specific versions.

Therefore, we write wrappers for all possible functions, at the expense of some overhead.

Binary numerical functions

        /= 0
end function user_cut_p

```

The following function returns an integer value, namely the number of particles

for which the condition is true. If there is no condition, it returns simply the length of the subevent.

A function would be more natural. Making it a subroutine avoids another compiler bug (internal error in nagfor 5.2 (649)). (See the interface `unary_evi`.)

(Eval trees: procedures)+≡

```
subroutine count_a (ival, en1, en0)
  integer, intent(out) :: ival
  type(eval_node_t), intent(in) :: en1
  type(eval_node_t), intent(inout), optional :: en0
  integer :: i, n, count
  n = subevt_get_length (en1%pval)
  if (present (en0)) then
    count = 0
    do i = 1, n
      en0%index = i
      en0%prt1 = subevt_get_prt (en1%pval, i)
      call eval_node_evaluate (en0)
      if (en0%lval) count = count + 1
    end do
    ival = count
  else
    ival = n
  end if
end subroutine count_a
```

This evaluates a user-defined event-shape observable for the current subevent.

(Eval trees: procedures)+≡

```
subroutine user_event_shape_a (rval, en1, en0)
  real(default), intent(out) :: rval
  type(eval_node_t), intent(in) :: en1
  type(eval_node_t), intent(inout), optional :: en0
  type(string_t) :: name

  rval = user_event_shape (c_prt (en1%pval), &
    int (subevt_get_length (en1%pval), kind=c_int))
end subroutine user_event_shape_a
```

Binary particle-list functions

This joins two subevents, stored in the evaluation nodes `en1` and `en2`. If `en0` is also present, it amounts to a logical test returning true or false for every pair

of particles. A particle of the second list gets a mask entry only if it passes the test for all particles of the first list.

(Eval trees: procedures)+≡

```

subroutine join_pp (subevt, en1, en2, en0)
  type(subevt_t), intent(inout) :: subevt
  type(eval_node_t), intent(in) :: en1, en2
  type(eval_node_t), intent(inout), optional :: en0
  logical, dimension(:), allocatable :: mask2
  integer :: i, j, n1, n2
  n1 = subevt_get_length (en1%pval)
  n2 = subevt_get_length (en2%pval)
  allocate (mask2 (n2))
  mask2 = .true.
  if (present (en0)) then
    do i = 1, n1
      en0%index = i
      en0%prt1 = subevt_get_prt (en1%pval, i)
      do j = 1, n2
        en0%prt2 = subevt_get_prt (en2%pval, j)
        call eval_node_evaluate (en0)
        mask2(j) = mask2(j) .and. en0%lval
      end do
    end do
  end if
  call subevt_join (subevt, en1%pval, en2%pval, mask2)
end subroutine join_pp

```

Combine two subevents, i.e., make a list of composite particles built from all possible particle pairs from the two lists. If `en0` is present, create a mask which is true only for those pairs that pass the test.

(Eval trees: procedures)+≡

```

subroutine combine_pp (subevt, en1, en2, en0)
  type(subevt_t), intent(inout) :: subevt
  type(eval_node_t), intent(in) :: en1, en2
  type(eval_node_t), intent(inout), optional :: en0
  logical, dimension(:,:), allocatable :: mask12
  integer :: i, j, n1, n2
  n1 = subevt_get_length (en1%pval)
  n2 = subevt_get_length (en2%pval)
  if (present (en0)) then
    allocate (mask12 (n1, n2))
    do i = 1, n1
      en0%index = i
      en0%prt1 = subevt_get_prt (en1%pval, i)
      do j = 1, n2
        en0%prt2 = subevt_get_prt (en2%pval, j)
        call eval_node_evaluate (en0)
        mask12(i,j) = en0%lval
      end do
    end do
    call subevt_combine (subevt, en1%pval, en2%pval, mask12)
  else
    call subevt_combine (subevt, en1%pval, en2%pval)
  end if
end subroutine combine_pp

```

```

        end if
    end subroutine combine_pp

```

Combine all particles of the first argument. If `en0` is present, create a mask which is true only for those particles that pass the test w.r.t. all particles in the second argument. If `en0` is absent, the second argument is ignored.

(Eval trees: procedures)+≡

```

subroutine collect_pp (subevt, en1, en2, en0)
    type(subevt_t), intent(inout) :: subevt
    type(eval_node_t), intent(in) :: en1, en2
    type(eval_node_t), intent(inout), optional :: en0
    logical, dimension(:), allocatable :: mask1
    integer :: i, j, n1, n2
    n1 = subevt_get_length (en1%pval)
    n2 = subevt_get_length (en2%pval)
    allocate (mask1 (n1))
    mask1 = .true.
    if (present (en0)) then
        do i = 1, n1
            en0%index = i
            en0%prt1 = subevt_get_prt (en1%pval, i)
            do j = 1, n2
                en0%prt2 = subevt_get_prt (en2%pval, j)
                call eval_node_evaluate (en0)
                mask1(i) = mask1(i) .and. en0%lval
            end do
        end do
    end if
    call subevt_collect (subevt, en1%pval, mask1)
end subroutine collect_pp

```

Select all particles of the first argument. If `en0` is present, create a mask which is true only for those particles that pass the test w.r.t. all particles in the second argument. If `en0` is absent, the second argument is ignored, and the first argument is transferred unchanged. (This case is not very useful, of course.)

(Eval trees: procedures)+≡

```

subroutine select_pp (subevt, en1, en2, en0)

end function user_obs_real_pp

```

The following function returns an integer value, namely the number of valid particle-pairs from both lists for which the condition is true. Invalid pairs (with common `src` entry) are ignored. If there is no condition, it returns the number of valid particle pairs.

A function would be more natural. Making it a subroutine avoids another compiler bug (internal error in nagfor 5.2 (649)). (See the interface `binary_num`.)

(Eval trees: procedures)+≡

```

subroutine count_pp (ival, en1, en2, en0)
    integer, intent(out) :: ival
    type(eval_node_t), intent(in) :: en1, en2
    type(eval_node_t), intent(inout), optional :: en0
    integer :: i, j, n1, n2, count
    n1 = subvt_get_length (en1%pval)
    n2 = subvt_get_length (en2%pval)
    if (present (en0)) then
        count = 0
        do i = 1, n1
            en0%index = i

```

```

        en0%prt1 = subevt_get_prt (en1%pval, i)
        do j = 1, n2
            en0%prt2 = subevt_get_prt (en2%pval, j)
            if (are_disjoint (en0%prt1, en0%prt2)) then
                call eval_node_evaluate (en0)
                if (en0%lval) count = count + 1
            end if
        end do
    end do
else
    count = 0
    do i = 1, n1
        do j = 1, n2
            if (are_disjoint (subevt_get_prt (en1%pval, i), &
                                subevt_get_prt (en2%pval, j))) then
                count = count + 1
            end if
        end do
    end do
end if
ival = count
end subroutine count_pp

```

This function makes up a subevent from the second argument which consists only of particles which match the PDG code array (first argument).

<Eval trees: procedures>+≡

```

subroutine select_pdg_ca (subevt, en1, en2, en0)
    type(subevt_t), intent(inout) :: subevt
    type(eval_node_t), intent(in) :: en1, en2
    type(eval_node_t), intent(inout), optional :: en0
    if (present (en0)) then
        call subevt_select_pdg_code (subevt, en1%aval, en2%pval, en0%ival)
    else
        call subevt_select_pdg_code (subevt, en1%aval, en2%pval)
    end if
end subroutine select_pdg_ca

```

Binary string functions

Currently, the only string operation is concatenation.

<Eval trees: procedures>+≡

```

subroutine concat_ss (string, en1, en2)
    type(string_t), intent(out) :: string
    type(eval_node_t), intent(in) :: en1, en2
    string = en1%sval // en2%sval
end subroutine concat_ss

```

20.1.4 Compiling the parse tree

The evaluation tree is built recursively by following a parse tree. Debug option:

<Eval trees: variables>≡

```
logical, parameter :: debug = .false.
```

Evaluate an expression. The requested type is given as an optional argument; default is numeric (integer or real).

(Eval trees: procedures)+≡

```
recursive subroutine eval_node_compile_genexpr &
  (en, pn, var_list, result_type)
  type(eval_node_t), pointer :: en
  type(parse_node_t), intent(in) :: pn
  type(var_list_t), intent(in), target :: var_list
  integer, intent(in), optional :: result_type
  if (debug) then
    print *, "read genexpr"; call parse_node_write (pn)
  end if
  if (present (result_type)) then
    select case (result_type)

  else
    call eval_node_compile_expr (en, pn, var_list)
  end if
  if (debug) then
    call eval_node_write (en)
    print *, "done genexpr"
  end if
end subroutine eval_node_compile_genexpr
```

Numeric expressions

This procedure compiles a numerical expression. This is a single term or a sum or difference of terms. We have to account for all combinations of integer and real arguments. If both are constant, we immediately do the calculation and allocate a constant node.

(Eval trees: procedures)+≡

```
recursive subroutine eval_node_compile_expr (en, pn, var_list)
  type(eval_node_t), pointer :: en
  type(parse_node_t), intent(in) :: pn
  type(var_list_t), intent(in), target :: var_list
  type(parse_node_t), pointer :: pn_term, pn_addition, pn_op, pn_arg
  type(eval_node_t), pointer :: en1, en2
  type(string_t) :: key
  integer :: t1, t2, t
  if (debug) then
```

Real, complex and integer values are numeric literals with an optional unit attached. In case of an integer, the unit actually makes it a real value in disguise. The signed version of real values is not possible in generic expressions; it is a special case for numeric constants in model files (see below). We do not introduce signed versions of complex values.

```

Compile a variable, with or without a specified type. Take the list of variables, look for the name and make a node with a pointer to the value. If no type is provided, the variable is numeric, and the stored value determines whether it is real or integer.

We explicitly demand that the variable is defined, so we do not accidentally point to variables that are declared only later in the script but have come into existence in a previous compilation pass.

Variables may actually be anonymous, these are expressions in disguise. In that case, the expression replaces the variable name in the parse tree, and we allocate an ordinary expression node in the eval tree.

Variables of type `V_PDG` (pdg-code array) are not treated here. They are handled by `eval_node_compile_cvariable`.

Retrieve the result of an integration. If the requested process has been integrated, the results are available as special variables. (The variables cannot be accessed in the usual way since they contain brackets in their names.)

Since this compilation step may occur before the processes have been loaded, we have to initialize the required variables before they are used.

This user observable behaves like a variable. We link the node to the generic user-observable entry in the variable list. The syntax element has an argument which provides the name of the user variable, this is stored as an eval-node alongside with the variable. When the variable value is used, the user-supplied external function is called and provides the (real) result value.

Variable definition

A block expression contains a variable definition (first argument) and an expression where the definition can be used (second argument). The `result_type` decides which type of expression is expected for the second argument. For numeric variables, if there is a mismatch between real and integer type, insert an extra node for type conversion.

```

Conditionals

A conditional has the structure if lexpr then expr else expr. So we first evaluate the logical expression, then depending on the result the first or second expression. Note that the second expression is mandatory.

The `result_type`, if present, defines the requested type of the `then` and `else` clauses. Default is numeric (int/real). If there is a mismatch between real and integer result types, insert conversion nodes.

(Eval trees: procedures)+≡

```

Comparisons

Up to the loop, this is easy. There is always at least one comparison. This is evaluated, and the result is the logical node **en**. If it is constant, we keep its second sub-node as **en2**. (Thus, at the very end **en2** has to be deleted if **en** is (still) constant.)

If there is another comparison, we first check if the first comparison was constant. In that case, there are two possibilities: (i) it was true. Then, its right-hand side is compared with the new right-hand side, and the result replaces the previous one which is deleted. (ii) it was false. In this case, the result of the whole comparison is false, and we can exit the loop without evaluating anything else.

Now assume that the first comparison results in a valid branch, its second sub-node kept as **en2**. We first need a copy of this, which becomes the new left-hand side. If **en2** is constant, we make an identical constant node **en1**. Otherwise, we make **en1** an appropriate pointer node. Next, the first branch is saved as **en0** and we evaluate the comparison between **en1** and the a right-hand side. If this turns out to be constant, there are again two possibilities: (i) true, then we revert to the previous result. (ii) false, then the wh

end subroutine eval_node_compile_compared_expr

```

This takes two extra arguments: **en1**, the left-hand-side of the comparison, is already allocated and evaluated. **en2** (the right-hand side) and **en** (the result) are allocated by the routine. **pn** is the parse node which contains the operator

and the right-hand side as subnodes.

If the result of the comparison is constant, **en1** is deleted but **en2** is kept, because it may be used in a subsequent comparison. **en** then becomes a constant. If the result is variable, **en** becomes a branch node which refers to **en1** and **en2**.

```

A particle-list value is a PDG-code array, a particle identifier, a variable, a (grouped) pexpr, a block pexpr, a conditional, or a particle-list function.

The `cexpr` node is responsible for transforming a constant PDG-code array into a subevent. It takes the code array as its first argument, the event subevent as its second argument, and the requested particle type (incoming/outgoing) as its zero-th argument. The result is the list of particles in the event that match the code array.

Particle functions

This combines the treatment of 'join', 'combine', 'collect', 'cluster', 'select', and 'extract' which all have the same syntax. The one or two argument nodes are allocated. If there is a condition, the condition node is also allocated as a logical expression, for which the variable list is augmented by the appropriate (unary/binary) observables.

20.1.5 Auxiliary functions for the compiler

Issue an error that the current node could not be compiled because of type mismatch:

<Eval trees: procedures>+≡

```

subroutine eval_type_error (pn, string, t)
    type(parse_node_t), intent(in) :: pn
    character(*), intent(in) :: string
    integer, intent(in) :: t
    type(string_t) :: type
    select case (t)
    case (V_NONE); type = "(none)"
    case (V_LOG); type = "'logical'"
    case (V_INT); type = "'integer'"
    case (V_REAL); type = "'real'"
    case (V_CMPLX); type = "'complex'"
    case default; type = "(unknown)"
    end select
    call parse_node_write (pn)
    call msg_fatal (" The " // string // &
        " operation is not defined for the given argument type " // &
        char (type))
end subroutine eval_type_error

```

If two numerics are combined, the result is integer if both arguments are integer, if one is integer and the other real or both are real, than its argument is real, otherwise complex.

<Eval trees: procedures>+≡

```

function numeric_result_type (t1, t2) result (t)
    integer, intent(in) :: t1, t2
    integer :: t

```

```

if (t1 == V_INT .and. t2 == V_INT) then
  t = V_INT
else if (t1 == V_INT .and. t2 == V_REAL) then
  t = V_REAL
else if (t1 == V_REAL .and. t2 == V_INT) then
  t = V_REAL
else if (t1 == V_REAL .and. t2 == V_REAL) then
  t = V_REAL
else
  t = V_CMPLX
end if
end function numeric_result_type

```

20.1.6 Evaluation

Evaluation is done recursively. For leaf nodes nothing is to be done.

Evaluating particle-list functions: First, we evaluate the particle lists. If a condition is present, we assign the particle pointers of the condition node to the allocated particle entries in the parent node, keeping in mind that the observables in the variable stack used for the evaluation of the condition also contain pointers to these entries. Then, the assigned procedure is evaluated, which sets the subevent in the parent node. If required, the procedure evaluates the condition node once for each (pair of) particles to determine the result.

20.1.7 Evaluation syntax

We have two different flavors of the syntax: with and without particles.

<Eval trees: variables>+≡
 type(syntax_t), target, save :: syntax_expr
 type(syntax_t), target, save :: syntax_pexpr

These are for testing only and may be removed:

<Eval trees: public>≡
 public :: syntax_expr_init
 public :: syntax_pexpr_init

<Eval trees: procedures>+≡
 subroutine syntax_expr_init ()
 type(ifile_t) :: ifile
 call define_expr_syntax (ifile, particles=.false., analysis=.false.)
 call syntax_init (syntax_expr, ifile)
 call ifile_final (ifile)
 end subroutine syntax_expr_init

subroutine syntax_pexpr_init ()
 type(ifile_t) :: ifile
 call define_expr_syntax (ifile, particles=.true., analysis=.false.)
 call syntax_init (syntax_pexpr, ifile)
 call ifile_final (ifile)
 end subroutine syntax_pexpr_init

<Eval trees: public>+≡
 public :: syntax_expr_final
 public :: syntax_pexpr_final

```

<Eval trees: procedures>+≡
  subroutine syntax_expr_final ()
    call syntax_final (syntax_expr)
  end subroutine syntax_expr_final

  subroutine syntax_pexpr_final ()
    call syntax_final (syntax_pexpr)
  end subroutine syntax_pexpr_final

```

```

<Eval trees: public>+≡
  public :: syntax_pexpr_write

```

```

<Eval trees: procedures>+≡
  subroutine syntax_pexpr_write (unit)
    integer, intent(in), optional :: unit
    call syntax_write (syntax_pexpr, unit)
  end subroutine syntax_pexpr_write

```

```

<Eval trees: public>+≡
  public :: define_expr_syntax

```

Numeric expressions.

```

```

Error message with debugging info:

```

<Eval trees: procedures>+≡
    subroutine eval_tree_unknown (eval_tree, parse_node)
        type(eval_tree_t), intent(in) :: eval_tree

```

```

    type(parse_node_t), intent(in) :: parse_node
    call parse_node_write_rec (parse_node)
    call eval_tree_write (eval_tree)
    call msg_error ("Evaluation yields an undefined result, inserting default")
end subroutine eval_tree_unknown

```

20.1.11 Factory Type

Since `eval_tree_t` is an implementation of `expr_t`, we also need a matching factory type and build method.

```

<Eval trees: public>+≡
    public :: eval_tree_factory_t

<Eval trees: types>+≡
    type, extends (expr_factory_t) :: eval_tree_factory_t
    private
        type(parse_node_t), pointer :: pn => null ()
    contains
    <Eval trees: eval tree factory: TBP>
end type eval_tree_factory_t

```

Output: delegate to the output of the embedded parse node.

```

<Eval trees: eval tree factory: TBP>≡
    procedure :: write => eval_tree_factory_write

<Eval trees: procedures>+≡
    subroutine eval_tree_factory_write (expr_factory, unit)
        class(eval_tree_factory_t), intent(in) :: expr_factory
        integer, intent(in), optional :: unit
        if (associated (expr_factory%pn)) then
            call parse_node_write_rec (expr_factory%pn, unit)
        end if
    end subroutine eval_tree_factory_write

```

Initializer: take a parse node and hide it thus from the environment.

```

<Eval trees: eval tree factory: TBP>+≡
    procedure :: init => eval_tree_factory_init

<Eval trees: procedures>+≡
    subroutine eval_tree_factory_init (expr_factory, pn)
        class(eval_tree_factory_t), intent(out) :: expr_factory
        type(parse_node_t), intent(in), pointer :: pn
        expr_factory%pn => pn
    end subroutine eval_tree_factory_init

```

Factory method: allocate expression with correct eval tree type. If the stored parse node is not associate, don't allocate.

```

<Eval trees: eval tree factory: TBP>+≡
    procedure :: build => eval_tree_factory_build

```

```

<Eval trees: procedures>+≡
  subroutine eval_tree_factory_build (expr_factory, expr)
    class(eval_tree_factory_t), intent(in) :: expr_factory
    class(expr_t), intent(out), allocatable :: expr
    if (associated (expr_factory%pn)) then
      allocate (eval_tree_t :: expr)

Chapter 21

Physics Models

A model object represents a physics model. It contains a table of particle data, a list of parameters, and a vertex table. The list of parameters is a variable list which includes the real parameters (which are pointers to the particle data table) and PDG array variables for the particles themselves. The vertex list is used for phase-space generation, not for calculating the matrix element.

The actual numeric model data are in the base type `model_data_t`, as part of the `qft` section. We implement the `model_t` as an extension of this, for convenient direct access to the base-type methods via inheritance. (Alternatively, we could delegate these calls explicitly.) The extension contains administrative additions, such as the methods for recalculating derived data and keeping the parameter set consistent. It thus acts as a proxy of the actual model-data object towards the `WHIZARD` package. There are further proxy objects, such as the `parameter_t` array which provides the interface to the actual numeric parameters.

Model definitions are read from model files. Therefore, this module contains a parser for model files. The parameter definitions (derived parameters) are Sindarin expressions.

The models, as read from file, are stored in a model library which is a simple list of model definitions. For setting up a process object we should make a copy (an instance) of a model, which gets the current parameter values from the global variable list.

21.1 Model module

```
<models.f90>≡  
  <File header>  
  
  module models  
  
    use, intrinsic :: iso_c_binding !NODEP!  
  
    <Use kinds>  
    use kinds, only: i8, i32  
    use kinds, only: c_default_float  
    <Use strings>
```

```

    use format_defs, only: FMT_19
    use io_units
    use unit_tests
    use diagnostics
    use md5
    use os_interface
    use physics_defs, only: UNDEFINED, SCALAR, SPINOR
    use model_data

    use ifiles
    use syntax_rules
    use lexers
    use parser
    use pdg_arrays
    use variables
    use eval_trees

    <Standard module head>

    <Models: public>

    <Models: parameters>

    <Models: types>

    <Models: interfaces>

    <Models: variables>

    contains

    <Models: procedures>

    <Models: tests>

    end module models

```

21.1.1 Physics Parameters

A parameter has a name, a value. Derived parameters also have a definition in terms of other parameters, which is stored as an `eval_tree`. External parameters are set by an external program.

This parameter object should be considered as a proxy object. The parameter name and value are stored in a corresponding `modelpar_data_t` object which is located in a `model_data_t` object. The latter is a component of the `model_t` handler. Methods of `parameter_t` can be delegated to the `par_data_t` component.

The `pn` component is a pointer to the parameter definition inside the model parse tree. It allows us to recreate the `eval_tree` when making copies (instances) of the parameter object.

```

<Models: parameters>≡
    integer, parameter :: PAR_NONE = 0

```

```
integer, parameter :: PAR_INDEPENDENT = 1, PAR_DERIVED = 2
integer, parameter :: PAR_EXTERNAL = 3
```

```
<Models: types>≡
type :: parameter_t
  private
  integer :: type = PAR_NONE
  class(modelpar_data_t), pointer :: data => null ()
  type(parse_node_t), pointer :: pn => null ()
  type(eval_tree_t) :: eval_tree
contains
  <Models: parameter: TBP>
end type parameter_t
```

Initialization depends on parameter type. Independent parameters are initialized by a constant value or a constant numerical expression (which may contain a unit). Derived parameters are initialized by an arbitrary numerical expression, which makes use of the current variable list. The expression is evaluated by the function `parameter_reset`.

This implementation supports only real parameters and real values.

```
<Models: parameter: TBP>≡
  procedure :: init_independent_value => parameter_init_independent_value
  procedure :: init_independent => parameter_init_independent
  procedure :: init_derived => parameter_init_derived
  procedure :: init_external => parameter_init_external

<Models: procedures>≡
  subroutine parameter_init_independent_value (par, par_data, name, value)
    class(parameter_t), intent(out) :: par
    class(modelpar_data_t), intent(in), target :: par_data
    type(string_t), intent(in) :: name
    real(default), intent(in) :: value
    par%type = PAR_INDEPENDENT
    par%data => par_data
    call par%data%init (name, value)
  end subroutine parameter_init_independent_value

  subroutine parameter_init_independent (par, par_data, name, pn)
    class(parameter_t), intent(out) :: par
    class(modelpar_data_t), intent(in), target :: par_data

par%type = PAR_EXTERNAL
par%data => par_data
call par%data%init (name, 0._default)
end subroutine parameter_init_external

```

The finalizer is needed for the evaluation tree in the definition.

```

<Models: parameter: TBP>+≡
  procedure :: final => parameter_final

<Models: procedures>+≡
  subroutine parameter_final (par)
    class(parameter_t), intent(inout) :: par
    call eval_tree_final (par%eval_tree)
  end subroutine parameter_final

```

All derived parameters should be recalculated if some independent parameters have changed:

```

<Models: parameter: TBP>+≡
  procedure :: reset_derived => parameter_reset_derived

<Models: procedures>+≡
  subroutine parameter_reset_derived (par)
    class(parameter_t), intent(inout) :: par
    select case (par%type)
    case (PAR_DERIVED)
      call eval_tree_evaluate (par%eval_tree)
      par%data = eval_tree_get_real (par%eval_tree)
    end select
  end subroutine parameter_reset_derived

```

Output. [We should have a formula format for the eval tree, suitable for input and output!]

```

<Models: parameter: TBP>+≡
  procedure :: write => parameter_write

<Models: procedures>+≡
  subroutine parameter_write (par, unit, write_defs)
    class(parameter_t), intent(in) :: par
    integer, intent(in), optional :: unit

```

```

logical, intent(in), optional :: write_defs
logical :: defs
integer :: u
u = given_output_unit (unit); if (u < 0) return
defs = .false.; if (present (write_defs)) defs = write_defs
select case (par%type)
case (PAR_INDEPENDENT)
  write (u, "(3x,A)", advance="no") "parameter"
case (PAR_DERIVED)

end select
call par%data%write (u)
select case (par%type)
case (PAR_DERIVED)
  if (defs) then
    call eval_tree_write (par%eval_tree, unit)
  else
    write (u, *)
  end if
case default
  write (u, *)
end select
end subroutine parameter_write

```

Screen output variant. Restrict output to the given parameter type.

```

<Models: parameter: TBP>+≡
  procedure :: show => parameter_show

<Models: procedures>+≡
  subroutine parameter_show (par, l, u, partype)
    class(parameter_t), intent(in) :: par
    integer, intent(in) :: l, u
    integer, intent(in) :: partype
    if (par%type == partype) then
      call par%data%show (l, u)
    end if
  end subroutine parameter_show

```

21.1.2 Model Object

A model object holds all information about parameters, particles, and vertices. For models that require an external program for parameter calculation, there is the pointer to a function that does this calculation, given the set of independent and derived parameters.

As explained above, the type inherits from `model_data_t`, which is the actual storage for the model data.

When reading a model, we create a parse tree. Parameter definitions are available via parse nodes. Since we may need those later when making model

instances, we keep the whole parse tree in the model definition (but not in the instances).

```

⟨Models: public⟩≡
    public :: model_t

⟨Models: types⟩+≡
    type, extends (model_data_t) :: model_t
    private
    character(32) :: md5sum = ""
    type(parameter_t), dimension(:), allocatable :: par
    integer :: max_par_name_length = 0
    integer :: max_field_name_length = 0
    type(var_list_t) :: var_list
    type(string_t) :: dlname
    procedure(model_init_external_parameters), nopass, pointer :: &
        init_external_parameters => null ()
    type(dlaccess_t) :: dlaccess
    type(parse_tree_t) :: parse_tree
    contains
    ⟨Models: model: TBP⟩
    end type model_t

```

This is the interface for a procedure that initializes the calculation of external parameters, given the array of all parameters.

```

⟨Models: interfaces⟩≡
    abstract interface
        subroutine model_init_external_parameters (par) bind (C)
            import
            real(c_default_float), dimension(*), intent(inout) :: par
        end subroutine model_init_external_parameters
    end interface

```

Initialization: Specify the number of parameters, particles, vertices and allocate memory. If an associated DL library is specified, load this library.

```

⟨Models: model: TBP⟩≡
    generic :: init => model_init
    procedure, private :: model_init

⟨Models: procedures⟩+≡
    subroutine model_init &
        (model, name, libname, os_data, n_par, n_prt, n_vtx)
        class(model_t), intent(inout) :: model

      return
    end if
    call c_f_procpointer (c_fptr, model% init_external_parameters)
  end if
end if
end subroutine model_init

```

For a model instance, we do not attempt to load a DL library. This is the core of the full initializer above.

```

<Models: model: TBP>+≡
  procedure, private :: basic_init => model_basic_init

<Models: procedures>+≡
  subroutine model_basic_init (model, name, n_par, n_prt, n_vtx)
    class(model_t), intent(inout) :: model
    type(string_t), intent(in) :: name
    integer, intent(in) :: n_par, n_prt, n_vtx
    allocate (model%par (n_par))
    call model%model_data_t%init (name, n_par, 0, n_prt, n_vtx)
  end subroutine model_basic_init

```

Finalization: The variable list contains allocated pointers, also the parse tree. We also close the DL access object, if any, that enables external parameter calculation.

```

<Models: model: TBP>+≡
  procedure :: final => model_final

```

```

<Models: procedures>+=
subroutine model_final (model)
  class(model_t), intent(inout) :: model
  integer :: i
  if (allocated (model%par)) then
    do i = 1, size (model%par)
      call model%par(i)%final ()
    end do
  end if
  call var_list_final (model%var_list, follow_link=.false.)
  if (model%dlname /= "") call dlaccess_final (model%dlaccess)
  call parse_tree_final (model%parse_tree)
  call model%model_data_t%final ()
end subroutine model_final

```

Output. By default, the output is in the form of an input file. If `verbose` is true, for each derived parameter the definition (eval tree) is displayed, and the vertex hash table is shown.

```

<Models: model: TBP>+=
procedure :: write => model_write

Make a copy of a parameter. We assume that the `model_data_t` parameter arrays have already been copied, so names and values are available in the current model, and can be used as targets. The eval tree should not be copied, since it should refer to the new variable list. The safe solution is to make use of the above initializers, which also take care of the building a new variable list.

end subroutine model_list_add

```

Read a new model from file and add to the list, if it does not yet exist. Finalize the model by allocating the vertex table. Return a pointer to the new model. If unsuccessful, return the original pointer.

The model is always inserted in the last link of a chain of model lists. This way, we avoid loading models twice from different contexts. When a model is modified, we should first allocate a local copy.

21.1.6 Model instances

A model instance is a copy of a model object. The parameters are true copies. The particle data and the variable list pointers should point to the copy, so modifying the parameters has only a local effect. Hence, we build them up explicitly. The vertex array is also rebuilt, it contains particle pointers. Finally, the vertex hash table can be copied directly since it contains no pointers.

The `multiplicity` entry depends on the association of the `mass_data` entry and therefore has to be set at the end.

The instance must carry the `target` attribute.

Parameters: the `copy_parameter` method essentially copies the parameter decorations (parse node, expression etc.). The current parameter values are part of the `model_data_t` base type and are copied afterwards via its `copy_from` method.

```

<Models: model: TBP>+≡
  procedure :: init_instance => model_copy

```

```

<Models: procedures>+≡
  subroutine model_copy (model, orig)
    class(model_t), intent(out), target :: model
    type(model_t), intent(in) :: orig
    integer :: n_par, n_prt, n_vtx
    integer :: i
    n_par = size (orig%par)
    n_prt = orig%get_n_field ()
    n_vtx = orig%get_n_vtx ()
    call model%basic_init (orig%get_name (), n_par, n_prt, n_vtx)
    model%md5sum = orig%md5sum
    do i = 1, n_par
      call model%copy_parameter (i, orig%par(i))
    end do

    <Auto components: procedures>

    <Auto components: tests>

  end module auto_components

```

21.2.1 Constraints: Abstract types

An abstract type that denotes a constraint on the automatically generated states. The concrete objects are applied as visitor objects at certain hooks during the splitting algorithm.

```

⟨Auto components: types⟩≡
    type, abstract :: split_constraint_t
    contains
    ⟨Auto components: split constraint: TBP⟩
end type split_constraint_t

```

By default, all checks return true.

```

⟨Auto components: split constraint: TBP⟩≡
    procedure :: check_before_split => split_constraint_check_before_split
    procedure :: check_before_insert => split_constraint_check_before_insert
    procedure :: check_before_record => split_constraint_check_before_record

⟨Auto components: procedures⟩≡
    subroutine split_constraint_check_before_split (c, table, pl, k, passed)
        class(split_constraint_t), intent(in) :: c
        class(ps_table_t), intent(in) :: table
        type(pdg_list_t), intent(in) :: pl
        integer, intent(in) :: k
        logical, intent(out) :: passed
        passed = .true.
    end subroutine split_constraint_check_before_split

    subroutine split_constraint_check_before_insert (c, table, pa, pl, passed)
        class(split_constraint_t), intent(in) :: c
        class(ps_table_t), intent(in) :: table
        type(pdg_array_t), intent(in) :: pa
        type(pdg_list_t), intent(inout) :: pl
        logical, intent(out) :: passed
        passed = .true.
    end subroutine split_constraint_check_before_insert

      allocate (constraints%cc(i)%c, source = c)
    end subroutine split_constraints_set

```

Apply checks.

`check_before_split` is applied to the particle list that we want to split.

`check_before_insert` is applied to the particle list `pl` that is to replace the particle `pa` that is split. This check may transform the particle list.

`check_before_record` is applied to the complete new particle list that results from splitting before it is recorded.

```

  <Auto components: split constraints: TBP>+≡
    procedure :: check_before_split => split_constraints_check_before_split
    procedure :: check_before_insert => split_constraints_check_before_insert

21.2.2 Specific constraints

Number of particles

Specific constraint: The number of particles plus the number of loops, if any, must remain less than the given limit. Note that the number of loops is defined only when we are recording the entry.

(Auto components: types)+≡

```

type, extends (split_constraint_t) :: constraint_n_tot
private
    integer :: n_max = 0
contains
    procedure :: check_before_split => constraint_n_tot_check_before_split
    procedure :: check_before_record => constraint_n_tot_check_before_record
end type constraint_n_tot

```

```

<Auto components: public>+≡
  public :: constrain_n_tot

<Auto components: procedures>+≡
  function constrain_n_tot (n_max) result (c)
    integer, intent(in) :: n_max
    type(constraint_n_tot) :: c
    c%n_max = n_max
  end function constrain_n_tot

  subroutine constraint_n_tot_check_before_split (c, table, pl, k, passed)
    class(constraint_n_tot), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_list_t), intent(in) :: pl
    integer, intent(in) :: k
    logical, intent(out) :: passed
    passed = pl%get_size () < c%n_max
  end subroutine constraint_n_tot_check_before_split

  subroutine constraint_n_tot_check_before_record (c, table, pl, n_loop, passed)
    class(constraint_n_tot), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_list_t), intent(in) :: pl
    integer, intent(in) :: n_loop
    logical, intent(out) :: passed
    passed = pl%get_size () + n_loop <= c%n_max
  end subroutine constraint_n_tot_check_before_record

```

Number of loops

Specific constraint: The number of loops is limited, independent of the total number of particles.

```

<Auto components: types>+≡
  type, extends (split_constraint_t) :: constraint_n_loop
  private
  integer :: n_loop_max = 0
  contains
  procedure :: check_before_record => constraint_n_loop_check_before_record
  end type constraint_n_loop

<Auto components: public>+≡
  public :: constrain_n_loop

<Auto components: procedures>+≡
  function constrain_n_loop (n_loop_max) result (c)
    integer, intent(in) :: n_loop_max
    type(constraint_n_loop) :: c
    c%n_loop_max = n_loop_max
  end function constrain_n_loop

  subroutine constraint_n_loop_check_before_record &
    (c, table, pl, n_loop, passed)
    class(constraint_n_loop), intent(in) :: c

```

```

class(ps_table_t), intent(in) :: table
type(pdg_list_t), intent(in) :: pl
integer, intent(in) :: n_loop
logical, intent(out) :: passed
passed = n_loop <= c%n_loop_max
end subroutine constraint_n_loop_check_before_record

```

Particles allowed in splitting

Specific constraint: The entries in the particle list ready for insertion are matched to a given list of particle patterns. If a match occurs, the entry is replaced by the corresponding pattern. If there is no match, the check fails.

```

<Auto components: types>+≡
type, extends (split_constraint_t) :: constraint_insert
private
type(pdg_list_t) :: pl_match
contains
procedure :: check_before_insert => constraint_insert_check_before_insert
end type constraint_insert

<Auto components: public>+≡
public :: constrain_insert

<Auto components: procedures>+≡
function constrain_insert (pl_match) result (c)
type(pdg_list_t), intent(in) :: pl_match
type(constraint_insert) :: c
c%pl_match = pl_match
end function constrain_insert

subroutine constraint_insert_check_before_insert (c, table, pa, pl, passed)
class(constraint_insert), intent(in) :: c
class(ps_table_t), intent(in) :: table
type(pdg_array_t), intent(in) :: pa
type(pdg_list_t), intent(inout) :: pl
logical, intent(out) :: passed
call pl%match_replace (c%pl_match, passed)
end subroutine constraint_insert_check_before_insert

```

Particles required in final state

Specific constraint: The entries in the recorded state must be a superset of the entries in the given list (for instance, the lowest-order state).

```

<Auto components: types>+≡
type, extends (split_constraint_t) :: constraint_require
private
type(pdg_list_t) :: pl
contains
procedure :: check_before_record => constraint_require_check_before_record
end type constraint_require

```

We check the current state by matching all particle entries against the stored particle list, and crossing out the particles in the latter list when a match is found. The constraint passed if all entries have been crossed out.

For an `if_table` in particular, we check the final state only.

```

<Auto components: public>+≡
  public :: constrain_require

<Auto components: procedures>+≡
  function constrain_require (pl) result (c)
    type(pdg_list_t), intent(in) :: pl
    type(constraint_require) :: c
    c%pl = pl
  end function constrain_require

  subroutine constraint_require_check_before_record &
    (c, table, pl, n_loop, passed)
    class(constraint_require), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_list_t), intent(in) :: pl
    integer, intent(in) :: n_loop
    logical, intent(out) :: passed
    logical, dimension(:), allocatable :: mask
    integer :: i, k, n_in
    select type (table)
    type is (if_table_t)
      n_in = 2
    class default
      n_in = 0
    end select
    allocate (mask (c%pl%get_size ()), source = .true.)
    do i = n_in + 1, pl%get_size ()
      k = c%pl%find_match (pl%get (i), mask)
      if (k /= 0) mask(k) = .false.
    end do
    passed = .not. any (mask)
  end subroutine constraint_require_check_before_record

```

Radiation

Specific constraint: We have radiation pattern if the original particle matches an entry in the list of particles that should replace it. The constraint prohibits this situation.

```

<Auto components: public>+≡
  public :: constrain_radiation

<Auto components: types>+≡
  type, extends (split_constraint_t) :: constraint_radiation
  private
  contains
    procedure :: check_before_insert => &
      constraint_radiation_check_before_insert
  end type constraint_radiation

```

```

<Auto components: procedures>+≡
function constrain_radiation () result (c)
    type(constraint_radiation) :: c
end function constrain_radiation

subroutine constraint_radiation_check_before_insert (c, table, pa, pl, passed)
    class(constraint_radiation), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_array_t), intent(in) :: pa
    type(pdg_list_t), intent(inout) :: pl
    logical, intent(out) :: passed
    passed = .not. (pl .match. pa)
end subroutine constraint_radiation_check_before_insert

```

Mass sum

Specific constraint: The sum of masses within the particle list must not exceed a given limit. For in/out state combinations, we check initial and final state separately.

```

<Auto components: public>+≡
public :: constrain_mass_sum

<Auto components: types>+≡
type, extends (split_constraint_t) :: constraint_mass_sum
    private
    real(default) :: mass_limit = 0
contains
    procedure :: check_before_record => constraint_mass_sum_check_before_record
end type constraint_mass_sum

<Auto components: procedures>+≡
function constrain_mass_sum (mass_limit) result (c)
    real(default), intent(in) :: mass_limit
    type(constraint_mass_sum) :: c
    c%mass_limit = mass_limit
end function constrain_mass_sum

subroutine constraint_mass_sum_check_before_record &
    (c, table, pl, n_loop, passed)
    class(constraint_mass_sum), intent(in) :: c
    class(ps_table_t), intent(in) :: table
    type(pdg_list_t), intent(in) :: pl
    integer, intent(in) :: n_loop
    logical, intent(out) :: passed
    select type (table)
    type is (if_table_t)
        passed = mass_sum (pl, 1, 2, table%model) <= c%mass_limit &
            .and. mass_sum (pl, 3, pl%get_size (), table%model) <= c%mass_limit
    class default
        passed = mass_sum (pl, 1, pl%get_size (), table%model) <= c%mass_limit
    end select
end subroutine constraint_mass_sum_check_before_record

```

Initial state particles

Specific constraint: The two incoming particles must both match the given particle list. This is checked for the generated particle list, just before it is recorded.

```
<Auto components: public>+≡
    public :: constrain_in_state

<Auto components: types>+≡
    type, extends (split_constraint_t) :: constraint_in_state
    private
        type(pdg_list_t) :: pl
    contains
        procedure :: check_before_record => constraint_in_state_check_before_record
    end type constraint_in_state

<Auto components: procedures>+≡
    function constrain_in_state (pl) result (c)
        type(pdg_list_t), intent(in) :: pl
        type(constraint_in_state) :: c
        c%pl = pl
    end function constrain_in_state

    subroutine constraint_in_state_check_before_record &
        (c, table, pl, n_loop, passed)
        class(constraint_in_state), intent(in) :: c
        class(ps_table_t), intent(in) :: table
        type(pdg_list_t), intent(in) :: pl
        integer, intent(in) :: n_loop
        logical, intent(out) :: passed
        integer :: i
        select type (table)
        type is (if_table_t)
            passed = .false.
            do i = 1, 2
                if (.not. (c%pl .match. pl%get (i))) return
            end do
        end select
        passed = .true.
    end subroutine constraint_in_state_check_before_record
```

21.2.3 Tables of states

Automatically generate a list of possible process components for a given initial set (a single massive particle or a preset list of states).

The set of process components are generated by recursive splitting, applying constraints on the fly that control and limit the process. The generated states are accumulated in a table that we can read out after completion.

```
<Auto components: types>+≡
    type, extends (pdg_list_t) :: ps_entry_t
        integer :: n_loop = 0
        integer :: n_rad = 0
```

```

        type(ps_entry_t), pointer :: previous => null ()
        type(ps_entry_t), pointer :: next => null ()
    end type ps_entry_t

```

This is the wrapper type for the decay tree for the list of final states and the final array. First, an abstract base type:

```

<Auto components: public>+≡
    public :: ps_table_t

<Auto components: types>+≡
    type, abstract :: ps_table_t
    private
        type(model_t), pointer :: model => null ()
        logical :: loops = .false.
        type(ps_entry_t), pointer :: first => null ()
        type(ps_entry_t), pointer :: last => null ()
    contains
        <Auto components: ps table: TBP>
    end type ps_table_t

```

The extensions: one for decay, one for generic final states. The decay-state table stores the initial particle. The final-state table is indifferent, and the initial/final state table treats the first two particles in its list as incoming antiparticles.

```

<Auto components: public>+≡
    public :: ds_table_t
    public :: if_table_t

<Auto components: types>+≡
    type, extends (ps_table_t) :: ds_table_t
    private
        integer :: pdg_in = 0
    contains
        <Auto components: ds table: TBP>
    end type ds_table_t

    type, extends (ps_table_t) :: fs_table_t
    contains
        <Auto components: fs table: TBP>
    end type fs_table_t

    type, extends (fs_table_t) :: if_table_t
    contains
        <Auto components: if table: TBP>
    end type if_table_t

```

Finalizer: we must deallocate the embedded list.

```

<Auto components: ps table: TBP>≡
    procedure :: final => ps_table_final

<Auto components: procedures>+≡
    subroutine ps_table_final (object)
        class(ps_table_t), intent(inout) :: object
        type(ps_entry_t), pointer :: current
    end subroutine

```

```

do while (associated (object%first))
  current => object%first
  object%first => current%next
  deallocate (current)
end do
nullify (object%last)
end subroutine ps_table_final

```

Write the table. A base writer for the body and specific writers for the headers.

```

<Auto components: ps table: TBP>+≡
  procedure :: base_write => ps_table_base_write
  procedure (ps_table_write), deferred :: write

<Auto components: interfaces>≡
  interface
    subroutine ps_table_write (object, unit)

21.2.4 Top-level methods

Create a table for a single-particle decay. Construct all possible final states from a single particle with PDG code `pdg_in`. The construction is limited by the given constraints.

```

<Auto components: ds table: TBP>+≡
  procedure :: make => ds_table_make

<Auto components: procedures>+≡
  subroutine ds_table_make (table, model, pdg_in, constraints)
    class(ds_table_t), intent(out) :: table
    type(model_t), intent(in), target :: model
    integer, intent(in) :: pdg_in
    type(split_constraints_t), intent(in) :: constraints
    type(pdg_list_t) :: pl_in
    type(pdg_list_t), dimension(0) :: pl
    logical :: passed
    call table%init (model, pl, constraints)
    table%pdg_in = pdg_in
    call pl_in%init (1)
    call pl_in%set (1, [pdg_in])
    call table%split (pl_in, 0, constraints)
  end subroutine ds_table_make

```

Split all entries in a growing table, starting from a table that may already contain states. Add and record split states on the fly.

```

<Auto components: fs table: TBP>+≡
  procedure :: radiate => fs_table_radiate

<Auto components: procedures>+≡
  subroutine fs_table_radiate (table, constraints)
    class(fs_table_t), intent(inout) :: table
    type(split_constraints_t) :: constraints
    type(ps_entry_t), pointer :: current
    integer :: i, s
    logical :: passed
    current => table%first
    do while (associated (current))
      call table%split (current, 0, constraints, record = .true.)
      current => current%next
    end do
  end do

```

```
end subroutine fs_table_radiate
```

21.2.5 Splitting algorithm

Recursive splitting. First of all, we record the current `pdg_list` in the table, subject to `constraints`, if requested. We also record copies of the list marked as loop corrections.

When we record a particle list, we sort it first.

If there is room for splitting, We take a PDG array list and the index of an element, and split this element in all possible ways. The split entry is inserted into the list, which we split further.

The recursion terminates whenever the split array would have a length greater than n_{\max} .

```
(Auto components: ps table: TBP)+≡
  procedure :: split => ps_table_split

(Auto components: procedures)+≡
  recursive subroutine ps_table_split (table, pl, n_rad, constraints, &
    record)
    class(ps_table_t), intent(inout) :: table
    class(pdg_list_t), intent(in) :: pl
    integer, intent(in) :: n_rad
    type(split_constraints_t), intent(in) :: constraints
    logical, intent(in), optional :: record
    integer :: n_loop, i
    logical :: passed
    type(vertex_iterator_t) :: vit
    integer, dimension(:), allocatable :: pdg1
    integer, dimension(:), allocatable :: pdg2
    if (present (record)) then
      if (record) then
        n_loop = 0
        INCR_LOOPS: do
          call table%record_sorted (pl, n_loop, n_rad, constraints, passed)
          if (.not. passed) exit INCR_LOOPS
          if (.not. table%loops) exit INCR_LOOPS
          n_loop = n_loop + 1
        end do INCR_LOOPS
      end if
    end if
    do i = 1, pl%get_size ()
      call constraints%check_before_split (table, pl, i, passed)
      if (passed) then
        pdg1 = pl%get (i)
        call vit%init (table%model, pdg1)
        SCAN_VERTICES: do
          call vit%get_next_match (pdg2)
          if (allocated (pdg2)) then
            call table%insert (pl, n_rad, i, pdg2, constraints)
          else
            exit SCAN_VERTICES
          end if
        end do
      end if
    end do
```

```

        end do SCAN_VERTICES
    end if
end do
end subroutine ps_table_split

```

The worker part: insert the list of particles found by vertex matching in place of entry *i* in the PDG list. Then split/record further.

The *n_in* parameter tells the replacement routine to insert the new particles after entry *n_in*. Otherwise, they follow index *i*.

```

⟨Auto components: ps table: TBP⟩+≡
    procedure :: insert => ps_table_insert

⟨Auto components: procedures⟩+≡
    recursive subroutine ps_table_insert &
        (table, pl, n_rad, i, pdg, constraints, n_in)
        class(ps_table_t), intent(inout) :: table
        class(pdg_list_t), intent(in) :: pl
        integer, intent(in) :: n_rad, i
        integer, dimension(:), intent(in) :: pdg
        type(split_constraints_t), intent(in) :: constraints
        integer, intent(in), optional :: n_in
        type(pdg_list_t) :: pl_insert
        logical :: passed
        integer :: k, s
        s = size (pdg)
        call pl_insert%init (s)
        do k = 1, s
            call pl_insert%set (k, pdg(k))
        end do
        call constraints%check_before_insert (table, pl%get (i), pl_insert, passed)
        if (passed) then
            call table%split (pl%replace (i, pl_insert, n_in), n_rad + s - 1, &
                constraints, record = .true.)
        end if
    end subroutine ps_table_insert

```

Special case: If we are splitting an initial particle, there is slightly more to do. We loop over the particles from the vertex match and replace the initial particle by each of them in turn. The remaining particles must be appended after the second initial particle, so they will end up in the out state. This is done by providing the *n_in* argument to the base method as an optional argument.

Note that we must call the base-method procedure explicitly, so the *table* argument keeps its dynamic type as *if_table* inside this procedure.

```

⟨Auto components: if table: TBP⟩+≡
    procedure :: insert => if_table_insert

⟨Auto components: procedures⟩+≡
    recursive subroutine if_table_insert &
        (table, pl, n_rad, i, pdg, constraints, n_in)
        class(if_table_t), intent(inout) :: table
        class(pdg_list_t), intent(in) :: pl
        integer, intent(in) :: n_rad, i
        integer, dimension(:), intent(in) :: pdg

```

```

type(split_constraints_t), intent(in) :: constraints
integer, intent(in), optional :: n_in
integer, dimension(:), allocatable :: pdg_work
integer :: p
if (i > 2) then
    call ps_table_insert (table, pl, n_rad, i, pdg, constraints)
else
    allocate (pdg_work (size (pdg)))
    do p = 1, size (pdg)
        pdg_work(1) = pdg(p)
        pdg_work(2:p) = pdg(1:p-1)
        pdg_work(p+1:) = pdg(p+1:)
        call ps_table_insert (table, &
            pl, n_rad, i, pdg_work, constraints, n_in = 2)
    end do
end if
end subroutine if_table_insert

```

Sort before recording. In the case of the `if_table`, we do not sort the first `n_in` particle entries. Instead, we check whether they are allowed in the `pl_beam` PDG list, if that is provided.

```

21.2.6 Tools

Compute the mass sum for a PDG list object, counting the entries with indices between (including) `n1` and `n2`. Rely on the requirement that if an entry is a PDG array, this array must be degenerate in mass.

(Auto components: procedures)+≡

```
function mass_sum (pl, n1, n2, model) result (m)
  type(pdg_list_t), intent(in) :: pl
  integer, intent(in) :: n1, n2
  type(model_t), intent(in), target :: model
  integer, dimension(:), allocatable :: pdg
  real(default) :: m
  type(field_data_t), pointer :: prt
  integer :: i
  m = 0
  do i = n1, n2
    pdg = pl%get (i)
    prt => model%get_field_ptr (pdg(1))
    m = m + prt%get_mass ()
  end do
end function mass_sum
```

Invert a PDG array, replacing particles by antiparticles. This depends on the model.

(Auto components: procedures)+≡

```
function invert_pdg_array (pa, model) result (pa_inv)
  type(pdg_array_t), intent(in) :: pa
  type(model_t), intent(in), target :: model
  type(pdg_array_t) :: pa_inv
  type(field_data_t), pointer :: prt
  integer :: i, pdg
  pa_inv = pa
  do i = 1, pa_inv%get_length ()
    pdg = pa_inv%get (i)
    prt => model%get_field_ptr (pdg)
    if (prt%has_antiparticle ()) call pa_inv%set (i, -pdg)
  end do
end function invert_pdg_array
```

21.2.7 Access results

Return the number of generated decays.

(Auto components: ps table: TBP)+≡

```
procedure :: get_length => ps_table_get_length
```

(Auto components: procedures)+≡

```
function ps_table_get_length (ps_table) result (n)
  class(ps_table_t), intent(in) :: ps_table
  integer :: n
  type(ps_entry_t), pointer :: entry
  n = 0
  entry => ps_table%first
```

```

do while (associated (entry))
  n = n + 1
  entry => entry%next
end do
end function ps_table_get_length

```

Return an allocated array of decay products (PDG codes). If requested, return also the loop and radiation order count.

```

<Auto components: ps table: TBP>+≡
  procedure :: get_pdg_out => ps_table_get_pdg_out

22.1.1 Physics

The ISR structure function is in the most crude approximation (LLA without α corrections, i.e. ϵ^0)

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad \text{with} \quad \epsilon = \frac{\alpha}{\pi} q_e^2 \ln \frac{s}{m^2}, \quad (22.1)$$

where m is the mass of the incoming (and outgoing) particle, which is initially assumed on-shell.

Here, the form of ϵ results from the kinematical bounds for the momentum squared of the outgoing particle, which in the limit $m^2 \ll s$ are given by

$$t_0 = -2\bar{x}E(E+p) + m^2 \approx -\bar{x}s, \quad (22.2)$$

$$t_1 = -2\bar{x}E(E-p) + m^2 \approx xm^2, \quad (22.3)$$

so the integration over the propagator $1/(t-m^2)$ yields

$$\ln \frac{t_0 - m^2}{t_1 - m^2} = \ln \frac{s}{m^2}. \quad (22.4)$$

In $f_0(x)$, there is an integrable singularity at $x = 1$ which does not spoil the integration, but would lead to an unbounded f_{\max} . Therefore, we map this singularity like

$$x = 1 - (1-x')^{1/\epsilon} \quad (22.5)$$

such that

$$\int dx f_0(x) = \int dx' \quad (22.6)$$

The structure function has three parameters: α , m_{in} of the incoming particle and s , the hard scale. Internally, we store the exponent ϵ which is the relevant parameter. (In conventional notation, $\epsilon = \beta/2$.) As defaults, we take the actual values of α (which is probably $\alpha(s)$), the actual mass m_{in} and the squared total c.m. energy s .

Including ϵ , ϵ^2 , and ϵ^3 corrections, the successive approximation of the ISR

structure function read

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \quad (22.7)$$

$$f_1(x) = g_1(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) \quad (22.8)$$

$$f_2(x) = g_2(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) - \frac{\epsilon^2}{8} \left(\frac{1+3x^2}{1-x} \ln x + 4(1+x) \ln(1-x) + 5+x \right) \quad (22.9)$$

$$\begin{aligned} f_3(x) = g_3(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) & - \frac{\epsilon^2}{8} \left(\frac{1+3x^2}{1-x} \ln x + 4(1+x) \ln(1-x) + 5+x \right) \\ & - \frac{\epsilon^3}{48} \left((1+x) [6 \text{Li}_2(x) + 12 \ln^2(1-x) - 3\pi^2] + 6(x+5) \ln(1-x) \right. \\ & \quad \left. + \frac{1}{1-x} \left[\frac{3}{2}(1+8x+3x^2) \ln x + 12(1+x^2) \ln x \ln(1-x) \right. \right. \\ & \quad \left. \left. - \frac{1}{2}(1+7x^2) \ln^2 x + \frac{1}{4}(39-24x-15x^2) \right] \right) \end{aligned} \quad (22.10)$$

where the successive approximations to the prefactor of the leading singularity

$$g(\epsilon) = \frac{\exp\left(\epsilon(-\gamma_E + \frac{3}{4})\right)}{\Gamma(1+\epsilon)}, \quad (22.11)$$

are given by

$$g_0(\epsilon) = 1 \quad (22.12)$$

$$g_1(\epsilon) = 1 + \frac{3}{4}\epsilon \quad (22.13)$$

$$g_2(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 \quad (22.14)$$

$$g_3(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 + \frac{27-24\pi^2+128\zeta(3)}{384}\epsilon^3, \quad (22.15)$$

where, numerically

$$\zeta(3) = 1.20205690315959428539973816151\dots \quad (22.16)$$

Although one could calculate the function $g(\epsilon)$ exactly, truncating its Taylor expansion ensures the exact normalization of the truncated structure function at each given order:

$$\int_0^1 dx f_i(x) = 1 \quad \text{for all } i. \quad (22.17)$$

Effectively, the $O(\epsilon)$ correction reduces the low- x tail of the structure function by 50% while increasing the coefficient of the singularity by $O(\epsilon)$. Relative to this, the $O(\epsilon^2)$ correction slightly enhances $x > \frac{1}{2}$ compared to $x < \frac{1}{2}$. At $x = 0$, $f_2(x)$ introduces a logarithmic singularity which should be cut off at

$x_0 = O(e^{-1/\epsilon})$: for lower x the perturbative series breaks down. The f_3 correction is slightly positive for low x values and negative near $x = 1$, where the Li_2 piece slightly softens the singularity at $x = 1$.

Instead of the definition for ϵ given above, it is customary to include a universal nonlogarithmic piece:

$$\epsilon = \frac{\alpha}{\pi} q_e^2 \left(\ln \frac{s}{m^2} - 1 \right) \quad (22.18)$$

22.1.2 Implementation

In the concrete implementation, the zeroth order mapping (22.5) is implemented, and the Jacobian is equal to $f_i(x)/f_0(x)$. This can be written as

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (22.19)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon - \frac{1-x^2}{2(1-x')} \quad (22.20)$$

$$\begin{aligned} \frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 - \frac{1-x^2}{2(1-x')} \\ - \frac{(1+3x^2)\ln x + (1-x)(4(1+x)\ln(1-x) + 5+x)}{8(1-x')}\epsilon \end{aligned} \quad (22.21)$$

For $x = 1$ (i.e., numerically indistinguishable from 1), this reduces to

$$\frac{f_0(x)}{f_0(x)} = 1 \quad (22.22)$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon \quad (22.23)$$

$$\frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27-8\pi^2}{96}\epsilon^2 \quad (22.24)$$

The last line in (22.21) is zero for

$$x_{\min} = 0.00714053329734592839549879772019 \quad (22.25)$$

(Mathematica result), independent of ϵ . For x values less than this we ignore this correction because of the logarithmic singularity which should in principle be resummed.

22.1.3 The ISR data block

  end subroutine isr_data_allocate_sf_int

```

22.1.4 The ISR object

The `isr_t` data type is a $1 \rightarrow 2$ interaction, i.e., we allow for single-photon emission only (but use the multi-photon resummed radiator function). The particles are ordered as (incoming, photon, outgoing).

There is no need to handle several flavors (and data blocks) in parallel, since ISR is always applied immediately after beam collision. (ISR for partons is accounted for by the PDFs themselves.) Polarization is carried through, i.e., we retain the polarization of the incoming particle and treat the emitted photon as unpolarized. Color is trivially carried through. This implies that particles 1 and 3 should be locked together. For ISR we don't need the `q` variable.

```
<SF isr: types>+≡
  type, extends (sf_int_t) :: isr_t
    type(isr_data_t), pointer :: data => null ()
    real(default) :: x = 0
    real(default) :: xb= 0
  contains
    <SF isr: isr: TBP>
  end type isr_t
```

Type string: has to be here, but there is no string variable on which ISR depends. Hence, a dummy routine.

```
<SF isr: isr: TBP>≡
  procedure :: type_string => isr_type_string

<SF isr: procedures>+≡
  function isr_type_string (object) result (string)
    class(isr_t), intent(in) :: object

```

22.1.5 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ were trivial. The ISR structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the x value is transformed. Higher orders affect the function value.

The structure function implementation applies the above mapping to the input (random) number \mathbf{r} to generate the momentum fraction \mathbf{x} and the function value \mathbf{f} . For numerical stability reasons, we also output \mathbf{xb} , which is $\bar{x} = 1 - x$.

For the ISR structure function, the mapping Jacobian cancels the structure function (to order zero). We apply the cancellation explicitly, therefore both the Jacobian \mathbf{f} and the zeroth-order value (see the `apply` method) are unity if mapping is turned on. If mapping is turned off, the Jacobian \mathbf{f} includes the value of the (zeroth-order) structure function, and strongly peaked.

```

<SF isr: isr: TBP>+=
    procedure :: complete_kinematics => isr_complete_kinematics

<SF isr: procedures>+=
    subroutine isr_complete_kinematics (sf_int, x, f, r, rb, map)
        class(isr_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: x
        real(default), intent(out) :: f
        real(default), dimension(:), intent(in) :: r
        real(default), dimension(:), intent(in) :: rb
        logical, intent(in) :: map
        real(default) :: eps
        eps = sf_int%data%eps
        if (map) then
            call map_power_1 (sf_int%xb, f, rb(1), eps)
        else
            sf_int%xb = rb(1)
            if (rb(1) > 0) then
                f = 1
            else
                f = 0
            end if
        end if
        sf_int%x = 1 - sf_int%xb
        x(1) = sf_int%x
        if (size (x) == 3) x(2:3) = r(2:3)
        call sf_int%split_momentum (x, sf_int%xb)
        select case (sf_int%status)
        case (SF_FAILED_KINEMATICS)
            sf_int%x = 0
            sf_int%xb= 0

```

```

        f = 0
    end select
end subroutine isr_complete_kinematics

```

Overriding the default method: we compute the x array from the momentum configuration. In the specific case of ISR, we also set the internally stored x and \bar{x} values, so they can be used in the following routine.

Note: the extraction of \bar{x} is not numerically safe, but it can't be as long as the base `recover_x` isn't.

```

<SF isr: isr: TBP>+≡
    procedure :: recover_x => sf_isr_recover_x

<SF isr: procedures>+≡
    subroutine sf_isr_recover_x (sf_int, x, x_free)
        class(isr_t), intent(inout) :: sf_int
        real(default), dimension(:), intent(out) :: x
        real(default), intent(inout), optional :: x_free
        call sf_int%base_recover_x (x, x_free)
        sf_int%x = x(1)
        sf_int%xb = 1 - x(1)
    end subroutine sf_isr_recover_x

```

Compute inverse kinematics. Here, we start with the x array and compute the “input” r values and the Jacobian f . After this, we can set momenta by the same formula as for normal kinematics.

For extracting x , we rely on the stored \bar{x} value, since the x value in the argument is likely imprecise. This means that either `complete_kinematics` or `recover_x` must be called first, for the current sampling point (but maybe another channel).

```

22.1.6 ISR application

For ISR, we could in principle compute kinematics and function value in a single step. In order to be able to reweight matrix elements including structure functions we split kinematics and structure function calculation. The structure function works on a single beam, assuming that the input momentum has been set.

For the structure-function evaluation, we rely on the fact that the power mapping, which we apply in the kinematics method (if the `map` flag is set), has a Jacobian which is just the inverse lowest-order structure function. With mapping active, the two should cancel exactly.

After splitting momenta, we set the outgoing momenta on-shell. We choose to conserve momentum, so energy conservation may be violated.

```

⟨SF isr: isr: TBP⟩+=
    procedure :: apply => isr_apply

⟨SF isr: procedures⟩+=

22.2.1 Physics

The EPA structure function for a photon inside an (elementary) particle p with energy E , mass m and charge q_p (e.g., electron) is given by ($\bar{x} \equiv 1 - x$)

$$\begin{aligned}
 f(x) = \frac{\alpha}{\pi} q_p^2 \frac{1}{x} & \left[\left(\bar{x} + \frac{x^2}{2} \right) \ln \frac{Q_{\max}^2}{Q_{\min}^2} \right. \\
 & \left. - \left(1 - \frac{x}{2} \right)^2 \ln \frac{x^2 + \frac{Q_{\max}^2}{E^2}}{x^2 + \frac{Q_{\min}^2}{E^2}} - x^2 \frac{m^2}{Q_{\min}^2} \left(1 - \frac{Q_{\min}^2}{Q_{\max}^2} \right) \right]. \quad (22.26)
 \end{aligned}$$

If no explicit Q bounds are provided, the kinematical bounds are

$$-Q_{\max}^2 = t_0 = -2\bar{x}(E^2 + p\bar{p}) + 2m^2 \approx -4\bar{x}E^2, \quad (22.27)$$

$$-Q_{\min}^2 = t_1 = -2\bar{x}(E^2 - p\bar{p}) + 2m^2 \approx -\frac{x^2}{\bar{x}}m^2. \quad (22.28)$$

The second and third terms in (22.26) are negative definite (and subleading). Noting that $\bar{x} + x^2/2$ is bounded between $1/2$ and 1 , we derive that $f(x)$ is always smaller than

$$\bar{f}(x) = \frac{\alpha}{\pi} q_p^2 \frac{L - 2 \ln x}{x} \quad \text{where} \quad L = \ln \frac{\min(4E_{\max}^2, Q_{\max}^2)}{\max(m^2, Q_{\min}^2)}, \quad (22.29)$$

where we allow for explicit Q bounds that narrow the kinematical range. Therefore, we generate this distribution:

$$\int_{x_0}^{x_1} dx \bar{f}(x) = C(x_0, x_1) \int_0^1 dx' \quad (22.30)$$

We set

$$\ln x = \frac{1}{2} \left\{ L - \sqrt{L^2 - 4 [x' \ln x_1 (L - \ln x_1) + \bar{x}' \ln x_0 (L - \ln x_0)]} \right\} \quad (22.31)$$

such that $x(0) = x_0$ and $x(1) = x_1$ and

$$\frac{dx}{dx'} = \left(\frac{\alpha}{\pi} q_p^2 \right)^{-1} x \frac{C(x_0, x_1)}{L - 2 \ln x} \quad (22.32)$$

with

$$C(x_0, x_1) = \frac{\alpha}{\pi} q_p^2 [\ln x_1 (L - \ln x_1) - \ln x_0 (L - \ln x_0)] \quad (22.33)$$

such that (22.30) is satisfied. Finally, we have

$$\int_{x_0}^{x_1} dx f(x) = C(x_0, x_1) \int_0^1 dx' \frac{f(x(x'))}{\bar{f}(x(x'))} \quad (22.34)$$

where x' is calculated from x via (22.31).

The structure of the mapping is most obvious from:

$$x'(x) = \frac{\log x (L - \log x) - \log x_0 (L - \log x_0)}{\log x_1 (L - \log x_1) - \log x_0 (L - \log x_0)}. \quad (22.35)$$

22.2.2 The EPA data block

The EPA parameters are: α , E_{\max} , m , Q_{\min} , and x_{\min} . Instead of m we can use the incoming particle PDG code as input; from this we can deduce the mass and charge.

Internally we store in addition $C_{0/1} = \frac{\alpha}{\pi} q_e^2 \ln x_{0/1} (L - \ln x_{0/1})$, the c.m. energy squared and the incoming particle mass.

```

22.2.3 The EPA object

The `epa_t` data type is a $1 \rightarrow 2$ interaction. We should be able to handle several flavors in parallel, since EPA is not necessarily applied immediately after beam collision: Photons may be radiated from quarks. In that case, the partons are massless and q_{\min} applies instead, so we do not need to generate several kinematical configurations in parallel.

The squared charge values multiply the matrix elements, depending on the flavour. We scan the interaction after building it, so we have the correct assignments.

The particles are ordered as (incoming, radiated, photon), where the photon initiates the hard interaction.

We generate an unpolarized photon and transfer initial polarization to the radiated parton. Color is transferred in the same way.

```

<SF epa: types>+≡

22.2.4 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

The EPA structure function allows for a straightforward mapping of the unit interval. The x value is transformed, and the mapped structure function becomes unity at its upper boundary.

The structure function implementation applies the above mapping to the input (random) number `r` to generate the momentum fraction `x` and the function value `f`. For numerical stability reasons, we also output `xb`, which is $\bar{x} = 1 - x$.

```

⟨SF epa: epa: TBP⟩+=

    f = 0
  end select
end if
end subroutine epa_inverse_kinematics

```

Overriding the default method: we compute the \mathbf{x} array from the momentum configuration. In the specific case of EPA, we also set the internally stored x and \bar{x} values, so they can be used in the following routine.

Note: the extraction of \bar{x} is not numerically safe, but it can't be as long as the base `recover_x` isn't.

```

<SF epa: epa: TBP>+≡
  procedure :: recover_x => sf_epa_recover_x

<SF epa: procedures>+≡
  subroutine sf_epa_recover_x (sf_int, x, x_free)
    class(epa_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), intent(inout), optional :: x_free
    call sf_int%base_recover_x (x, x_free)
    sf_int%x = x(1)
    sf_int%xb = 1 - x(1)
  end subroutine sf_epa_recover_x

```

22.2.5 EPA application

For EPA, we can in principle compute kinematics and function value in a single step. In order to be able to reweight events, kinematics and structure function application are separated. This function works on a single beam, assuming that the input momentum has been set. We need three random numbers as input: one for x , and two for the polar and azimuthal angles. Alternatively, for the no-recoil case, we can skip p_T generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated x values are identical.

```

<SF epa: epa: TBP>+≡
  procedure :: apply => epa_apply

```

```

<SF epa: procedures>+≡
subroutine epa_apply (sf_int, scale)

22.3.1 Physics

The EWA structure function for a Z or W inside a fermion (lepton or quark) depends on the vector-boson polarization. We distinguish transversal (\pm) and

longitudinal (0) polarization.

$$F_+(x) = \frac{1}{16\pi^2} \frac{(v-a)^2 + (v+a)^2 \bar{x}^2}{x} \left[\ln \left(\frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (22.36)$$

$$F_-(x) = \frac{1}{16\pi^2} \frac{(v+a)^2 + (v-a)^2 \bar{x}^2}{x} \left[\ln \left(\frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right] \quad (22.37)$$

$$F_0(x) = \frac{v^2 + a^2}{8\pi^2} \frac{2\bar{x}}{x} \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \quad (22.38)$$

where $p_{\perp,\max}$ is the cutoff in transversal momentum, M is the vector-boson mass, v and a are the vector and axial-vector couplings, and $\bar{x} \equiv 1-x$. Note that the longitudinal structure function is finite for large cutoff, while the transversal structure function is logarithmically divergent.

The maximal transverse momentum is given by the kinematical limit, it is

$$p_{\perp,\max} = \bar{x}\sqrt{s}/2. \quad (22.39)$$

The vector and axial couplings for a fermion branching into a W are

$$v_W = \frac{g}{2\sqrt{2}}, \quad a_W = \frac{g}{2\sqrt{2}}. \quad (22.40)$$

For Z emission, this is replaced by

$$v_Z = \frac{g}{2\cos\theta_w} (t_3 - 2q\sin^2\theta_w), \quad a_Z = \frac{g}{2\cos\theta_w} t_3, \quad (22.41)$$

where $t_3 = \pm\frac{1}{2}$ is the fermion isospin, and q its charge.

For an initial antifermion, the signs of the axial couplings are inverted. Note that a common sign change of v and a is irrelevant.

The EWA depends on the parameters g , $\sin^2\theta_w$, M_W , and M_Z . These can all be taken from the SM input, and the prefactors are calculated from those and the incoming particle type.

Since these structure functions have a $1/x$ singularity (which is not really relevant in practice, however, since the vector boson mass is finite), we map this singularity allowing for nontrivial x bounds:

$$x = \exp(\bar{r} \ln x_0 + r \ln x_1) \quad (22.42)$$

such that

$$\int_{x_0}^{x_1} \frac{dx}{x} = (\ln x_1 - \ln x_0) \int_0^1 dr. \quad (22.43)$$

As a user parameter, we have the cutoff $p_{\perp,\max}$. The divergence $1/x$ also requires a x_0 cutoff; and for completeness we introduce a corresponding x_1 . Physically, the minimal sensible value of x is M^2/s , although the approximation loses its value already at higher x values.

22.3.2 The EWA data block

The EWA parameters are: $p_{T,\max}$, c_V , c_A , and m . Instead of m we can use the incoming particle PDG code as input; from this we can deduce the mass and charges. In the initialization phase it is not yet determined whether a W or a Z is radiated, hence we set the vector and axial-vector couplings equal to the common prefactors $g/2 = e/2/\sin\theta_W$.

In principle, for EWA it would make sense to allow the user to also set the upper bound for x , x_{\max} , but we fix it to one here.

22.3.3 The EWA object

The `ewa_t` data type is a $1 \rightarrow 2$ interaction. We should be able to handle several flavors in parallel, since EWA is not necessarily applied immediately after beam collision: W/Z bosons may be radiated from quarks. In that case, the partons are massless and q_{\min} applies instead, so we do not need to generate several kinematical configurations in parallel.

The particles are ordered as (incoming, radiated, W/Z), where the W/Z initiates the hard interaction.

In the case of EPA, we generated an unpolarized photon and transferred initial polarization to the radiated parton. Color is transferred in the same way. I do not know whether the same can/should be done for EWA, as the structure functions depend on the W/Z polarization. If we are having Z bosons, both up- and down-type fermions can participate. Otherwise, with a W^+ an up-type fermion is transferred to a down-type fermion, and the other way round.

```

<SF ewa: types>+≡

22.3.4 Kinematics

Set kinematics. The EWA structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the x value is transformed. Higher orders affect the function value. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, the exponential mapping for the $1/x$ singularity discussed above is applied.

```

22.3.5 EWA application

For EWA, we can compute kinematics and function value in a single step. This function works on a single beam, assuming that the input momentum has been set. We need four random numbers as input: one for x , one for Q^2 , and two for the polar and azimuthal angles. Alternatively, we can skip p_T generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated x values are identical.

```

22.4.1 Physics

Beamstrahlung is applied before ISR. The CIRCE1 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously). Nevertheless it is factorized:

The functional form in the CIRCE1 parameterization is defined for electrons or photons

$$f(x) = \alpha x^\beta (1-x)^\gamma \quad (22.44)$$

for $x < 1 - \epsilon$ (resp. $x > \epsilon$ in the photon case). In the remaining interval, the standard form is zero, with a delta singularity at $x = 1$ (resp. $x = 0$). Equivalently, the delta part may be distributed uniformly among this interval. This latter form is implemented in the `kirke` version of the `CIRCE1` subroutines, and is used here.

The parameter `circe1_eps` sets the peak mapping of the `CIRCE1` structure function. Its default value is 10^{-5} . The other parameters are the parameterization version and revision number, the accelerator type, and the \sqrt{s} value used by `CIRCE1`. The chattiness can also be set.

Since the energy is distributed in a narrow region around unity (for electrons) or zero (for photons), it is advantageous to map the interval first. The mapping is controlled by the parameter `circe1_epsilon` which is taken from the `CIRCE1` internal data structure.

The \sqrt{s} value, if not explicitly set, is taken from the process data. Note that interpolating \sqrt{s} is not recommended; one should rather choose one of the distinct values known to `CIRCE1`.

22.4.2 The CIRCE1 data block

The `CIRCE1` parameters are: The incoming flavors, the flags whether the photon or the lepton is the parton in the hard interaction, the flags for the generation mode (generator/mapping/no mapping), the mapping parameter ϵ , \sqrt{s} and several steering parameters: `ver`, `rev`, `acc`, `chat`.

In generator mode, the x values are actually discarded and a random number generator is used instead.

    allocate (circe1_t :: sf_int)
  end subroutine circe1_data_allocate_sf_int

```

22.4.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```

<SF circe1: types>+=
  type, extends (circe1_rng_t) :: rng_obj_t
    class(rng_t), allocatable :: rng
  contains
    procedure :: generate => rng_obj_generate
  end type rng_obj_t

<SF circe1: procedures>+=
  subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(double), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate

```

22.4.4 The CIRCE1 object

This is a $2 \rightarrow 4$ interaction, where, depending on the parameters, any two of the four outgoing particles are connected to the hard interactions, the others are radiated. Knowing that all particles are colorless, we do not have to deal with color.

The flavors are sorted such that the first two particles are the incoming leptons, the next two are the radiated particles, and the last two are the partons initiating the hard interaction.

CIRCE1 does not support polarized beams explicitly. For simplicity, we nevertheless carry beam polarization through to the outgoing electrons and make the photons unpolarized.

```

<SF circe1: types>+=
  type, extends (sf_int_t) :: circe1_t
    type(circe1_data_t), pointer :: data => null ()
    real(default), dimension(2) :: x = 0

```

```

    real(default) :: f = 0
    logical, dimension(2) :: continuum = .true.
    logical, dimension(2) :: peak = .true.
    type(rng_obj_t) :: rng_obj
contains
  <SF circe1: circe1: TBP>
end type circe1_t

```

Type string: has to be here, but there is no string variable on which CIRCE1 depends. Hence, a dummy routine.

```

<SF circe1: circe1: TBP>≡
  procedure :: type_string => circe1_type_string

<SF circe1: procedures>+≡
  function circe1_type_string (object) result (string)
    class(circe1_t), intent(in) :: object

22.5.1 Physics

CIRCE2 describes photon spectra Beamstrahlung is applied before ISR. The CIRCE2 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously).

22.5.2 The CIRCE2 data block

The CIRCE2 parameters are: file and collider specification, incoming (= outgoing) particles. The luminosity is returned by `circe2_luminosity`.

```

22.5.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

```

<SF circe2: types>+≡
  type, extends (circe2_rng_t) :: rng_obj_t
    class(rng_t), allocatable :: rng
  contains
    procedure :: generate => rng_obj_generate
  end type rng_obj_t

```

```

<SF circe2: procedures>+≡
  subroutine rng_obj_generate (rng_obj, u)
    class(rng_obj_t), intent(inout) :: rng_obj
    real(default), intent(out) :: u
    real(default) :: x
    call rng_obj%rng%generate (x)
    u = x
  end subroutine rng_obj_generate

```

22.5.4 The CIRCE2 object

For CIRCE2 spectra it does not make sense to describe the state matrix as a radiation interaction, even if photons originate from laser backscattering. Instead, it is a $2 \rightarrow 2$ interaction where the incoming particles are identical to the outgoing ones.

The current implementation of CIRCE2 does support polarization and classical correlations, but no entanglement, so the density matrix of the outgoing particles is diagonal. The incoming particles are unpolarized (user-defined polarization for beams is meaningless, since polarization is described by the data file). The outgoing particles are polarized or polarization-averaged, depending on user request.

When assigning matrix elements, we scan the previously initialized state matrix. For each entry, we extract helicity and call the structure function. In the unpolarized case, the helicity is undefined and replaced by value zero. In the polarized case, there are four entries. If the generator is used, only one entry is nonzero in each call. Which one, is determined by comparing with a previously (randomly, distributed by relative luminosity) selected pair of helicities.

```

<SF circe2: types>+≡

```

```

type, extends (sf_int_t) :: circe2_t

22.6 Energy-scan spectrum

This spectrum is actually a trick that allows us to plot the c.m. energy dependence of a cross section without scanning the input energy. We start with the observation that a spectrum $f(x)$, applied to one of the incoming beams only, results in a cross section

$$\sigma = \int dx f(x) \hat{\sigma}(xs). \quad (22.45)$$

We want to compute the distribution of $E = \sqrt{\hat{s}} = \sqrt{xs}$, i.e.,

$$\frac{d\sigma}{dE} = \frac{2\sqrt{x}}{\sqrt{s}} \frac{d\sigma}{dx} = \frac{2\sqrt{x}}{\sqrt{s}} f(x) \hat{\sigma}(xs), \quad (22.46)$$

so if we set

$$f(x) = \frac{\sqrt{s}}{2\sqrt{x}}, \quad (22.47)$$

we get the distribution

$$\frac{d\sigma}{dE} = \hat{\sigma}(\hat{s} = E^2). \quad (22.48)$$

We implement this as a spectrum with a single parameter x . The parameters for the individual beams are computed as $x_i = \sqrt{x}$, so they are equal and the kinematics is always symmetric.

22.6.1 Data type

The `norm` is unity if the total cross section should be normalized to one, and \sqrt{s} if it should be normalized to the total energy. In the latter case, the differential distribution $d\sigma/d\sqrt{\hat{s}}$ coincides with the partonic cross section $\hat{\sigma}$ as a function of $\sqrt{\hat{s}}$.

22.7 Using beam event data

Instead of an analytic beam description, beam data may be provided in form of an event file. In its most simple form, the event file contains pairs of x values, relative to nominal beam energies. More advanced formats may include polarization, etc. The current implementation carries beam polarization through, if specified.

The code is very similar to the energy scan described above.

22.8.2 Codes for default PDF sets

The default PDF for protons set is chosen to be CTEQ6ll (LO fit with LO α_s).

```
<SF lhpdf: parameters>≡
```

```
character(*), parameter :: LHAPDF5_DEFAULT_PROTON = "cteq6ll.LHpdf"
character(*), parameter :: LHAPDF5_DEFAULT_PION   = "ABFKWPI.LHgrid"
character(*), parameter :: LHAPDF5_DEFAULT_PHOTON = "GSG960.LHgrid"
character(*), parameter :: LHAPDF6_DEFAULT_PROTON = "CT10"
```

22.8.3 LHAPDF library interface

Here we specify explicit interfaces for all LHAPDF routines that we use below.

```
<SF lhpdf: interfaces>≡
```

```
interface
  subroutine InitPDFsetM (set, file)
    integer, intent(in) :: set
    character(*), intent(in) :: file
  end subroutine InitPDFsetM
end interface
```

```
<SF lhpdf: interfaces>+≡
```

```
interface
  subroutine InitPDFM (set, mem)
    integer, intent(in) :: set, mem
  end subroutine InitPDFM
end interface
```

```
<SF lhpdf: interfaces>+≡
```

```
interface
  subroutine numberPDFM (set, n_members)
    integer, intent(in) :: set
    integer, intent(out) :: n_members
  end subroutine numberPDFM
end interface
```

```
<SF lhpdf: interfaces>+≡
```

```
interface
  subroutine evolvePDFM (set, x, q, ff)
    integer, intent(in) :: set

  end subroutine GetQ2maxM
end interface

```

```

<SF lhpdf: interfaces>+=
  interface
    function has_photon () result(flag)
      logical :: flag
    end function has_photon
  end interface

```

22.8.4 The LHAPDF status

This type holds the initialization status of the LHAPDF system. Entry 1 is for proton PDFs, entry 2 for pion PDFs, entry 3 for photon PDFs.

Since it is connected to the external LHAPDF library, this is a truly global object. We implement it as a private module variable. To access it from elsewhere, the caller has to create and initialize an object of type `lhpdf_status_t`, which acts as a proxy.

```

<SF lhpdf: types>=
  type :: lhpdf_global_status_t
    private
      logical, dimension(3) :: initialized = .false.
    end type lhpdf_global_status_t

<SF lhpdf: variables>=
  type(lhpdf_global_status_t) :: lhpdf_global_status

<SF lhpdf: procedures>=
  function lhpdf_global_status_is_initialized (set) result (flag)
    logical :: flag
    integer, intent(in), optional :: set
    if (present (set)) then
      select case (set)
        case (1:3);   flag = lhpdf_global_status%initialized(set)
        case default; flag = .false.
      end select
    else
      flag = any (lhpdf_global_status%initialized)
    end if
  end function lhpdf_global_status_is_initialized

<SF lhpdf: procedures>+=
  subroutine lhpdf_global_status_set_initialized (set)
    integer, intent(in) :: set
    lhpdf_global_status%initialized(set) = .true.
  end subroutine lhpdf_global_status_set_initialized

```

This is the only public procedure, it tells the system to forget about previous initialization, allowing for changing the chosen PDF set. Note that such a feature works only if the global program flow is serial, so no two distinct sets are accessed simultaneously. But this applies to LHAPDF anyway.

```

<SF lhpdf: public>=
  public :: lhpdf_global_reset

```

```

<SF lhpdf: procedures>+=
  subroutine lhpdf_global_reset ()
    lhpdf_global_status%initialized = .false.
  end subroutine lhpdf_global_reset

```

22.8.5 LHAPDF initialization

Before using LHAPDF, we have to initialize it with a particular data set and member. This applies not just if we use structure functions, but also if we just use an α_s formula. The integer `set` should be 1 for proton, 2 for pion, and 3 for photon, but this is just convention.

It appears as if LHAPDF does not allow for multiple data sets being used concurrently (?), so multi-threaded usage with different sets (e.g., a scan) is excluded. The current setup with a global flag that indicates initialization is fine as long as Whizard itself is run in serial mode at the Sindarin level. If we introduce multithreading in any form from Sindarin, we have to rethink the implementation of the LHAPDF interface. (The same considerations apply to builtin PDFs.)

If the particular set has already been initialized, do nothing. This implies that whenever we want to change the setup for a particular set, we have to reset the LHAPDF status. `lhpdf_initialize` has an obvious name clash with `lhpdf_init`, the reason it works for `pdf_builtin` is that there things are outsourced to a separate module (inc. `lhpdf_status` etc.).

```

<SF lhpdf: public>+=
  public :: lhpdf_initialize

<SF lhpdf: procedures>+=
  subroutine lhpdf_initialize (set, prefix, file, member, pdf, b_match)
    integer, intent(in) :: set
    type(string_t), intent(inout) :: prefix
    type(string_t), intent(inout) :: file
    type(lhpdf_pdf_t), intent(inout), optional :: pdf
    integer, intent(inout) :: member
    logical, intent(in), optional :: b_match

```

22.8.6 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

```

<SF lhpdf: lhpdf: TBP>≡
  procedure :: complete_kinematics => lhpdf_complete_kinematics

<SF lhpdf: procedures>+≡
  subroutine lhpdf_complete_kinematics (sf_int, x, f, r, rb, map)
    class(lhpdf_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), intent(out) :: f
    real(default), dimension(:), intent(in) :: r
    real(default), dimension(:), intent(in) :: rb
    logical, intent(in) :: map
    real(default) :: xb1
    if (map) then
      call msg_fatal ("LHAPDF: map flag not supported")
    else
      x(1) = r(1)
      f = 1
    end if
    xb1 = 1 - x(1)
    call sf_int%split_momentum (x, xb1)
    select case (sf_int%status)
    case (SF_DONE_KINEMATICS)
      sf_int%x = x(1)
    case (SF_FAILED_KINEMATICS)
      sf_int%x = 0
      f = 0
    end select
  end subroutine lhpdf_complete_kinematics

```

Compute inverse kinematics. Here, we start with the x array and compute the “input” r values and the Jacobian f . After this, we can set momenta by the same formula as for normal kinematics.

```

<SF lhpdf: lhpdf: TBP>+≡
  procedure :: inverse_kinematics => lhpdf_inverse_kinematics

<SF lhpdf: procedures>+≡
  subroutine lhpdf_inverse_kinematics (sf_int, x, f, r, rb, map, set_momenta)

```

22.8.8 The LHAPDF object

The `lhpdf_t` data type is a $1 \rightarrow 2$ interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

This is the LHAPDF object which holds input data together with the interaction. We also store the x momentum fraction and the scale, since kinematics and function value are requested at different times.

The PDF application is a $1 \rightarrow 2$ splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

```

<SF lhpdf: types>+≡
type, extends (sf_int_t) :: lhpdf_t

22.9.4 The PDF object

The PDF $1 \rightarrow 2$ interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

The PDF application is a $1 \rightarrow 2$ splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

```

<SF pdf builtin: types>+≡
  type, extends (sf_int_t) :: pdf_builtin_t
    type(pdf_builtin_data_t), pointer :: data => null ()

```

```
contains
```

⟨SF user: user data: TBP⟩

```
end type user_data_t
```

Assign procedure pointers from a dynamically loaded library, given the specified name.

We have to distinguish three cases: (1) Both beams are affected, and the user spectrum implements both beams. There is a single data object. (2) Both beams are affected, and the user spectrum applies to single beams. Fill two different objects. (3) A single beam is affected.

```

22.10.4 The user structure function

For maximal flexibility, user structure functions separate kinematics from dynamics just as the PDF interface does. (JRR: Ok, I guess this now done for all structure functions, right?) We create `c_prt_t` particle objects from the incoming momenta (all other quantum numbers are irrelevant) and call the user-supplied kinematics function to compute the outgoing momenta, along with other variables that will be needed for matrix element evaluation. If known, we use the mass squared computed above. !!! JRR: WK please check (#529) I don't know actually whether this really fits into the setup done by WK.

```

<SF user: types>+=
  !!! JRR: WK please check (#529)

22.10.5 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

```

<SF user: user: TBP>+≡
  procedure :: complete_kinematics => user_complete_kinematics

<SF user: procedures>+≡
subroutine user_complete_kinematics (sf_int, x, f, r, rb, map)
  !!! JRR: WK please check (#529)
  !!! This cannot be correct, as the CIRCE1 structure function has
  !!! twice the variables (2->4 instead of 1->2 splitting)

```

Chapter 23

Phase space and hard matrix elements

These modules contain the internal representation and evaluation of phase space and the interface to (hard-)process evaluation.

mappings Generate invariant masses and decay angles from given random numbers (or the inverse operation). Each mapping pertains to a particular node in a phase-space tree. Different mappings account for uniform distributions, resonances, zero-mass behavior, and so on.

phs_trees Phase space parameterizations for scattering processes are defined recursively as if there was an initial particle decaying. This module sets up a representation in terms of abstract trees, where each node gets a unique binary number. Each tree is stored as an array of branches, where integers indicate the connections. This emulates pointers in a transparent way. Real pointers would also be possible, but seem to be less efficient for this particular case.

phs_forests The type defined by this module collects the decay trees corresponding to a given process and the applicable mappings. To set this up, a file is read which is either written by the user or by the **cascades** module functions. The module also contains the routines that evaluate phase space, i.e., generate momenta from random numbers and back.

cascades This module is a Feynman diagram generator with the particular purpose of finding the phase space parameterizations best suited for a given process. It uses a model file to set up the possible vertices, generates all possible diagrams, identifies resonances and singularities, and simplifies the list by merging equivalent diagrams and dropping irrelevant ones. This process can be controlled at several points by user-defined parameters. Note that it depends on the particular values of particle masses, so it cannot be done before reading the input file.

23.1 Single-particle phase space

This module implements the phase space for a single particle, i.e., the solid angle, in a straightforward parameterization with a single channel. The phase-space implementation may be used either for $1 \rightarrow 2$ decays or for $2 \rightarrow 2$ scattering processes, so the number of incoming particles is the only free parameter in the configuration. In the latter case, we should restrict its use to non-resonant s-channel processes, because there is no mapping of the scattering angle.

(We might extend this later to account for generic $2 \rightarrow 2$ situations, e.g., account for a Coulomb singularity or detect an s-channel resonance structure that requires matching structure-function mappings.)

This is derived from the `phs_test` implementation in the `phs_base` module above, even more simplified, but intended for actual use.

```

```

23.1.2 Kinematics implementation

We generate $\cos\theta$ and ϕ uniformly, covering the solid angle.

Note: The incoming momenta must be in the c.m. system.

```

<PHS single: public>+≡
    public :: phs_single_t

<PHS single: types>+≡
    type, extends (phs_t) :: phs_single_t
        contains
        <PHS single: phs single: TBP>
    end type phs_single_t

```

Output. The `verbose` setting is irrelevant, we just display the contents of the base object.

```

<PHS single: phs single: TBP>≡
  procedure :: write => phs_single_write

<PHS single: procedures>+≡
  subroutine phs_single_write (object, unit, verbose)
    class(phs_single_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    u = given_output_unit (unit)
    call object%base_write (u)
  end subroutine phs_single_write

```

The finalizer is empty.

```

<PHS single: phs single: TBP>+≡
  procedure :: final => phs_single_final

<PHS single: procedures>+≡
  subroutine phs_single_final (object)
    class(phs_single_t), intent(inout) :: object
  end subroutine phs_single_final

```

Initialization. We allocate arrays (`base_init`) and adjust the phase-space volume. The massless two-particle phase space volume is

$$\Phi_2 = \frac{1}{4(2\pi)^5} = 2.55294034614 \times 10^{-5} \quad (23.1)$$

For a decay with nonvanishing masses (m_3, m_4), there is a correction factor

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}} \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \quad (23.2)$$

For a scattering process with nonvanishing masses, the correction factor is

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}^2} \lambda^{1/2}(\hat{s}, m_1^2, m_2^2) \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \quad (23.3)$$

If the energy is fixed, this is constant. Otherwise, we have to account for varying \hat{s} .

```

<PHS single: phs single: TBP>+≡
  procedure :: init => phs_single_init

<PHS single: procedures>+≡
  subroutine phs_single_init (phs, phs_config)

23.2 Mappings

Mappings are objects that encode the transformation of the interval $(0,1)$ to a physical variable m^2 or $\cos\theta$ (and back), as it is used in the phase space parameterization. The mapping objects contain fixed parameters, the associated methods implement the mapping and inverse mapping operations, including the computation of the Jacobian (phase space factor).

```
<mappings.f90>≡  
  <File header>  
  
  module mappings  
  
    <Use kinds>  
    use kinds, only: TC  
    <Use strings>  
    use io_units  
    use constants, only: pi  
    use format_defs, only: FMT_19  
    use diagnostics  
    use md5  
    use model_data  
    use flavors  
  
    <Standard module head>  
  
    <Mappings: public>  
  
    <Mappings: parameters>  
  
    <Mappings: types>  
  
    <Mappings: interfaces>  
  
    contains  
  
    <Mappings: procedures>  
  
  end module mappings
```

23.2.1 Default parameters

This type holds the default parameters, needed for setting the scale in cases where no mass parameter is available. The contents are public.

```
<Mappings: public>≡  
  public :: mapping_defaults_t  
  
<Mappings: types>≡  
  type :: mapping_defaults_t  
    real(default) :: energy_scale = 10  
    real(default) :: invariant_mass_scale = 10

    close (u)
  end function mapping_defaults_md5sum

```

23.2.2 The Mapping type

Each mapping has a type (e.g., s-channel, infrared), a binary code (redundant, but useful for debugging), and a reference particle. The flavor code of this particle is stored for bookkeeping reasons, what matters are the mass and width of this particle. Furthermore, depending on the type, various mapping parameters can be set and used.

The parameters **a1** to **a3** (for m^2 mappings) and **b1** to **b3** (for $\cos \theta$ mappings) are values that are stored once to speed up the calculation, if **variable_limits** is false. The exact meaning of these parameters depends on the mapping type. The limits are fixed if there is a fixed c.m. energy.

```

⟨Mappings: public⟩+≡
    public :: mapping_t

⟨Mappings: types⟩+≡
    type :: mapping_t
    private
        integer :: type = NO_MAPPING
        integer(TC) :: bincode
        type(flavor_t) :: flv
        real(default) :: mass = 0
        real(default) :: width = 0
        logical :: a_unknown = .true.
        real(default) :: a1 = 0
        real(default) :: a2 = 0
        real(default) :: a3 = 0
        logical :: b_unknown = .true.
        real(default) :: b1 = 0
        real(default) :: b2 = 0
        real(default) :: b3 = 0
        logical :: variable_limits = .true.
    end type mapping_t

```

The valid mapping types. The extra type STEP_MAPPING is used only internally.

```

⟨Mappings: parameters⟩≡
    ⟨Mapping modes⟩

```

23.2.3 Screen output

Do not write empty mappings.

```

⟨Mappings: public⟩+≡
    public :: mapping_write

⟨Mappings: procedures⟩+≡
    subroutine mapping_write (map, unit, verbose)
        type(mapping_t), intent(in) :: map
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose
        integer :: u
        character(len=9) :: str
        u = given_output_unit (unit); if (u < 0) return
        select case(map%type)
        case(S_CHANNEL); str = "s_channel"

```

```

case(COLLINEAR); str = "collinear"

case(ON_SHELL); str = "on_shell"
case default; str = "???????"
end select
if (map%type /= NO_MAPPING) then
  write (u, '(1x,A,I4,A)') &
    "Branch #", map%bincode, ": " // &
    "Mapping (" // str // ") for particle " // &
    "' ' // char (flavor_get_name (map%flv)) // ' '"
  if (present (verbose)) then
    if (verbose) then
      select case (map%type)
      case (S_CHANNEL, RADIATION, STEP_MAPPING_E, STEP_MAPPING_H)
        write (u, "(1x,A,3(" // FMT_19 // "))" ) &
          " m/w = ", map%mass, map%width
      case default
        write (u, "(1x,A,3(" // FMT_19 // "))" ) &
          " m = ", map%mass
      end select
      select case (map%type)
      case (S_CHANNEL, T_CHANNEL, U_CHANNEL, &
        STEP_MAPPING_E, STEP_MAPPING_H, &
        COLLINEAR, INFRARED, RADIATION)
        write (u, "(1x,A,3(" // FMT_19 // "))" ) &
          " a1/2/3 = ", map%a1, map%a2, map%a3
      end select
      select case (map%type)
      case (T_CHANNEL, U_CHANNEL, COLLINEAR)
        write (u, "(1x,A,3(" // FMT_19 // "))" ) &
          " b1/2/3 = ", map%b1, map%b2, map%b3
      end select
    end if
  end if
end if
end subroutine mapping_write

```

23.2.4 Define a mapping

The initialization routine sets the mapping type and the particle (binary code and flavor code) for which the mapping applies (e.g., a Z resonance in branch #3). We only need the absolute value of the flavor code.

```

<Mappings: public>+≡
  public :: mapping_init

<Mappings: procedures>+≡
  subroutine mapping_init (mapping, bincode, type, f, model)
    type(mapping_t), intent(inout) :: mapping

```

```

integer(TC), intent(in) :: bincode
type(string_t), intent(in) :: type
integer, intent(in), optional :: f
class(model_data_t), intent(in), optional, target :: model
mapping%bincode = bincode
select case (char (type))
case ("s_channel"); mapping%type = S_CHANNEL
case ("collinear"); mapping%type = COLLINEAR
case ("infrared"); mapping%type = INFRARED
case ("radiation"); mapping%type = RADIATION
case ("t_channel"); mapping%type = T_CHANNEL
case ("u_channel"); mapping%type = U_CHANNEL
case ("step_exp"); mapping%type = STEP_MAPPING_E
case ("step_hyp"); mapping%type = STEP_MAPPING_H
case ("on_shell"); mapping%type = ON_SHELL
case default
    call msg_bug ("Mappings: encountered undefined mapping key '" &
        // char (type) // "'")
end select
if (present (f) .and. present (model)) &
    call flavor_init (mapping%flv, abs (f), model)
end subroutine mapping_init

```

This sets the actual mass and width, using a parameter set. Since the auxiliary parameters will only be determined when the mapping is first called, they are marked as unknown.

```

<Mappings: public>+≡
    public :: mapping_set_parameters

<Mappings: procedures>+≡
    subroutine mapping_set_parameters (map, mapping_defaults, variable_limits)
        type(mapping_t), intent(inout) :: map
        type(mapping_defaults_t), intent(in) :: mapping_defaults
        logical, intent(in) :: variable_limits
        if (map%type /= NO_MAPPING) then
            map%mass = flavor_get_mass (map%flv)
            map%width = flavor_get_width (map%flv)
            map%variable_limits = variable_limits
            map%a_unknown = .true.
            map%b_unknown = .true.
            select case (map%type)
            case (S_CHANNEL)
                if (map%mass <= 0) then
                    call mapping_write (map)
                    call msg_fatal &
                        & (" S-channel resonance must have positive mass")
                else if (map%width <= 0) then
                    call mapping_write (map)
                    call msg_fatal &
                        & (" S-channel resonance must have positive width")
                end if
            case (RADIATION)
                map%width = max (map%width, mapping_defaults%energy_scale)
            case (INFRARED, COLLINEAR)

```

```

        map%mass = max (map%mass, mapping_defaults%invariant_mass_scale)
    case (T_CHANNEL, U_CHANNEL)
        map%mass = max (map%mass, mapping_defaults%momentum_transfer_scale)
    end select
end if
end subroutine mapping_set_parameters

```

For a step mapping the mass and width are set directly, instead of being determined from the flavor parameter (which is meaningless here). They correspond to the effective upper bound of phase space due to a resonance, as opposed to the absolute upper bound.

```

<Mappings: public>+≡
    public :: mapping_set_step_mapping_parameters

23.2.7 Mappings of the invariant mass

Inserting an x value between 0 and 1, we want to compute the corresponding invariant mass $m^2(x)$ and the jacobian, aka phase space factor $f(x)$. We also need the reverse operation.

In general, the phase space factor f is defined by

$$\frac{1}{s} \int_{m_{\min}^2}^{m_{\max}^2} dm^2 g(m^2) = \int_0^1 dx \frac{1}{s} \frac{dm^2}{dx} g(m^2(x)) = \int_0^1 dx f(x) g(x), \quad (23.4)$$

where thus

$$f(x) = \frac{1}{s} \frac{dm^2}{dx}. \quad (23.5)$$

With this mapping, a function of the form

$$g(m^2) = c \frac{dx(m^2)}{dm^2} \quad (23.6)$$

is mapped to a constant:

$$\frac{1}{s} \int_{m_{\min}^2}^{m_{\max}^2} dm^2 g(m^2) = \int_0^1 dx f(x) g(m^2(x)) = \int_0^1 dx \frac{c}{s}. \quad (23.7)$$

Here is the mapping routine. Input are the available energy squared s , the limits for m^2 , and the x value. Output are the m^2 value and the phase space factor f .

```

```

Trivial mapping

We simply map the boundaries of the interval (m_{\min}, m_{\max}) to $(0, 1)$:

$$m^2 = (1 - x)m_{\min}^2 + xm_{\max}^2; \quad (23.8)$$

the inverse is

$$x = \frac{m^2 - m_{\min}^2}{m_{\max}^2 - m_{\min}^2}. \quad (23.9)$$

Hence

$$f(x) = \frac{m_{\max}^2 - m_{\min}^2}{s}, \quad (23.10)$$

and we have, as required,

$$f(x) \frac{dx}{dm^2} = \frac{1}{s}. \quad (23.11)$$

We store the constant parameters the first time the mapping is called – or, if limits vary, recompute them each time.

```

⟨Constants for trivial msq mapping⟩≡
  if (map%variable_limits .or. map%a_unknown) then
    map%a1 = 0
    map%a2 = msq_max - msq_min
    map%a3 = map%a2 / s
    map%a_unknown = .false.
  end if

⟨Apply trivial msq mapping⟩≡
  msq = (1-x) * msq_min + x * msq_max
  f = map%a3

⟨Apply inverse trivial msq mapping⟩≡
  if (map%a2 /= 0) then
    x = (msq - msq_min) / map%a2
  else
    x = 0
  end if
  f = map%a3

```

Resonance or step mapping does not make much sense if the resonance mass is outside the kinematical bounds. If this is the case, revert to `NO_MAPPING`. This is possible even if the kinematical bounds vary from event to event.

```

⟨Modify mapping type if necessary⟩≡
  select case (type)
  case (S_CHANNEL, STEP_MAPPING_E, STEP_MAPPING_H)
    msq0 = map%mass**2
    if (msq0 < msq_min .or. msq0 > msq_max) type = NO_MAPPING
  end select

```

Breit-Wigner mapping

A Breit-Wigner resonance with mass M and width Γ is flattened by the following mapping:

This mapping does not make much sense if the resonance mass is too low. If this is the case, revert to `NO_MAPPING`. There is a tricky point with this if the

mass is too high: `msq_max` is not a constant if structure functions are around. However, switching the type depending on the overall energy does not change the integral, it is just another branching point.

$$m^2 = M(M + t\Gamma), \quad (23.12)$$

where

$$t = \tan \left[(1-x) \arctan \frac{m_{\min}^2 - M^2}{M\Gamma} + x \arctan \frac{m_{\max}^2 - M^2}{M\Gamma} \right]. \quad (23.13)$$

The inverse:

$$x = \frac{\arctan \frac{m^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma}}{\arctan \frac{m_{\max}^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma}} \quad (23.14)$$

The phase-space factor of this transformation is

$$f(x) = \frac{M\Gamma}{s} \left(\arctan \frac{m_{\max}^2 - M^2}{M\Gamma} - \arctan \frac{m_{\min}^2 - M^2}{M\Gamma} \right) (1 + t^2). \quad (23.15)$$

This maps any function proportional to

$$g(m^2) = \frac{M\Gamma}{(m^2 - M^2)^2 + M^2\Gamma^2} \quad (23.16)$$

to a constant times $1/s$.

```

  f = map%a3 * (1 + tmp**2)

```

Mapping for massless splittings

This mapping accounts for approximately scale-invariant behavior where $\ln M^2$ is evenly distributed.

$$m^2 = m_{\min}^2 + M^2 (\exp(xL) - 1) \quad (23.17)$$

where

$$L = \ln \left(\frac{m_{\max}^2 - m_{\min}^2}{M^2} + 1 \right). \quad (23.18)$$

The inverse:

$$x = \frac{1}{L} \ln \left(\frac{m^2 - m_{\min}^2}{M^2} + 1 \right) \quad (23.19)$$

The constant M is a characteristic scale. Above this scale ($m^2 - m_{\min}^2 \gg M^2$), this mapping behaves like $x \propto \ln m^2$, while below the scale it reverts to a linear mapping.

The phase-space factor is

$$f(x) = \frac{M^2}{s} \exp(xL) L. \quad (23.20)$$

A function proportional to

$$g(m^2) = \frac{1}{(m^2 - m_{\min}^2) + M^2} \quad (23.21)$$

is mapped to a constant, i.e., a simple pole near m_{\min} with a regulator mass M .

This type of mapping is useful for massless collinear and infrared singularities, where the scale is stored as the mass parameter. In the radiation case (IR radiation off massive particle), the heavy particle width is the characteristic scale.

```

⟨Constants for s-channel pole mapping⟩≡
    if (map%variable_limits .or. map%a_unknown) then
        if (type == RADIATION) then
            msq0 = map%width**2
        else

⟨Apply inverse s-channel pole mapping⟩≡
    msq1 = msq - msq_min + map%a1
    x = log (msq1 / map%a1) / map%a2
    f = map%a3 * msq1

```

Mapping for t-channel poles

This is also approximately scale-invariant, and we use the same type of mapping as before. However, we map $1/x$ singularities at both ends of the interval; again, the mapping becomes linear when the distance is less than M^2 :

$$m^2 = \begin{cases} m_{\min}^2 + M^2 (\exp(xL) - 1) & \text{for } 0 < x < \frac{1}{2} \\ m_{\max}^2 - M^2 (\exp((1-x)L) - 1) & \text{for } \frac{1}{2} \leq x < 1 \end{cases} \quad (23.22)$$

where

$$L = 2 \ln \left(\frac{m_{\max}^2 - m_{\min}^2}{2M^2} + 1 \right). \quad (23.23)$$

The inverse:

$$x = \begin{cases} \frac{1}{L} \ln \left(\frac{m^2 - m_{\min}^2}{M^2} + 1 \right) & \text{for } m^2 < (m_{\max}^2 - m_{\min}^2)/2 \\ 1 - \frac{1}{L} \ln \left(\frac{m_{\max}^2 - m^2}{M^2} + 1 \right) & \text{for } m^2 \geq (m_{\max}^2 - m_{\min}^2)/2 \end{cases} \quad (23.24)$$

The phase-space factor is

$$f(x) = \begin{cases} \frac{M^2}{s} \exp(xL) L. & \text{for } 0 < x < \frac{1}{2} \\ \frac{M^2}{s} \exp((1-x)L) L. & \text{for } \frac{1}{2} \leq x < 1 \end{cases} \quad (23.25)$$

A (continuous) function proportional to

$$g(m^2) = \begin{cases} 1/(m^2 - m_{\min}^2) + M^2 & \text{for } m^2 < (m_{\max}^2 - m_{\min}^2)/2 \\ 1/((m_{\max}^2 - m^2) + M^2) & \text{for } m^2 \geq (m_{\max}^2 - m_{\min}^2)/2 \end{cases} \quad (23.26)$$

is mapped to a constant by this mapping, i.e., poles near both ends of the interval.

```

⟨Constants for t-channel pole mapping⟩≡

  x = 1 - log (msq1/map%a1) / map%a2
end if
f = map%a3 * msq1

```

23.2.8 Step mapping

Step mapping is useful when the allowed range for a squared-mass variable is large, but only a fraction at the lower end is populated because the particle in question is an (off-shell) decay product of a narrow resonance. I.e., if the resonance was forced to be on-shell, the upper end of the range would be the resonance mass, minus the effective (real or resonance) mass of the particle(s) in the sibling branch of the decay.

The edge of this phase space section has a width which is determined by the width of the parent, plus the width of the sibling branch. (The widths might be added in quadrature, but this precision is probably not important.)

Fermi function

A possible mapping is derived from the Fermi function which has precisely this behavior. The Fermi function is given by

$$f(x) = \frac{1}{1 + \exp \frac{x-\mu}{\gamma}} \quad (23.27)$$

where x is taken as the invariant mass squared, μ is the invariant mass squared of the edge, and γ is the effective width which is given by the widths of the parent and the sibling branch. (Widths might be added in quadrature, but we do not require this level of precision.)

$$x = \frac{m^2 - m_{\min}^2}{\Delta m^2} \quad (23.28)$$

$$\mu = \frac{m_{\max, \text{eff}}^2 - m_{\min}^2}{\Delta m^2} \quad (23.29)$$

$$\gamma = \frac{2m_{\max, \text{eff}}\Gamma}{\Delta m^2} \quad (23.30)$$

with

$$\Delta m^2 = m_{\max}^2 - m_{\min}^2 \quad (23.31)$$

m^2 is thus given by

$$m^2(x) = xm_{\max}^2 + (1-x)m_{\min}^2 \quad (23.32)$$

For the mapping, we compute the integral $g(x)$ of the Fermi function, normalized such that $g(0) = 0$ and $g(1) = 1$. We introduce the abbreviations

$$\alpha = 1 - \gamma \ln \frac{1 + \beta e^{1/\gamma}}{1 + \beta} \quad (23.33)$$

$$\beta = e^{-\mu/\gamma} \quad (23.34)$$

and obtain

$$g(x) = \frac{1}{\alpha} \left(x - \gamma \ln \frac{1 + \beta e^{x/\gamma}}{1 + \beta} \right) \quad (23.35)$$

The actual mapping is the inverse function $h(y) = g^{-1}(y)$,

$$h(y) = -\gamma \ln \left(e^{-\alpha y/\gamma} (1 + \beta) - \beta \right) \quad (23.36)$$

The Jacobian is

$$\frac{dh}{dy} = \alpha \left(1 - e^{\alpha y/\gamma} \frac{\beta}{1 + \beta} \right)^{-1} \quad (23.37)$$

which is equal to $1/(dg/dx)$, namely

$$\frac{dg}{dx} = \frac{1}{\alpha} \frac{1}{1 + \beta e^{x/\gamma}} \quad (23.38)$$

The final result is

$$\int_{m_{\min}^2}^{m_{\max}^2} dm^2 F(m^2) = \Delta m^2 \int_0^1 dx F(m^2(x)) \quad (23.39)$$

$$= \Delta m^2 \int_0^1 dy F(m^2(h(y))) \frac{dh}{dy} \quad (23.40)$$

Here is the implementation. We fill `a1`, `a2`, `a3` with α, β, γ , respectively.

```

⟨Constants for exponential step mapping⟩≡
  if (map%variable_limits .or. map%a_unknown) then
    map%a3 = max (2 * map%mass * map%width / (msq_max - msq_min), 0.01_default)
    map%a2 = exp (- (map%mass**2 - msq_min) / (msq_max - msq_min) &
                  / map%a3)

  x = (z - map%a3 * log (tmp / (1 + map%a2))) &
      / map%a1
  f = map%a1 * tmp * (msq_max - msq_min) / s

```

Hyperbolic mapping

The Fermi function has the drawback that it decreases exponentially. It might be preferable to take a function with a power-law decrease, such that the high-mass region is not completely depopulated.

Here, we start with the actual mapping which we take as

$$h(y) = \frac{b}{a - y} - \frac{b}{a} + \mu y \quad (23.41)$$

with the abbreviation

$$a = \frac{1}{2} \left(1 + \sqrt{1 + \frac{4b}{1-\mu}} \right) \quad (23.42)$$

This is a hyperbola in the xy plane. The derivative is

$$\frac{dh}{dy} = \frac{b}{(a-y)^2} + \mu \quad (23.43)$$

The constants correspond to

$$\mu = \frac{m_{\max, \text{eff}}^2 - m_{\min}^2}{\Delta m^2} \quad (23.44)$$

$$b = \frac{1}{\mu} \left(\frac{2m_{\max, \text{eff}} \Gamma}{\Delta m^2} \right)^2 \quad (23.45)$$

The inverse function is the solution of a quadratic equation,

$$g(x) = \frac{1}{2} \left[\left(a + \frac{x}{\mu} + \frac{b}{a\mu} \right) - \sqrt{\left(a - \frac{x}{\mu} \right)^2 + 2 \frac{b}{a\mu} \left(a + \frac{x}{\mu} \right) + \left(\frac{b}{a\mu} \right)^2} \right] \quad (23.46)$$

The constants $a_{1,2,3}$ are identified with a, b, μ .

```

                + tmp**2)) / 2
  f = (map%a2 / (map%a1 - x)**2 + map%a3) * (msq_max - msq_min) / s

```

23.2.9 Mappings of the polar angle

The other type of singularity, a simple pole just outside the integration region, can occur in the integration over $\cos \theta$. This applies to exchange of massless (or light) particles.

Double poles (Coulomb scattering) are also possible, but only in certain cases. These are also handled by the single-pole mapping.

The mapping is analogous to the previous m^2 pole mapping, but with a different normalization and notation of variables:

$$\frac{1}{2} \int_{-1}^1 d \cos \theta g(\theta) = \int_0^1 dx \frac{d \cos \theta}{dx} g(\theta(x)) = \int_0^1 dx f(x) g(x), \quad (23.47)$$

where thus

$$f(x) = \frac{1}{2} \frac{d \cos \theta}{dx}. \quad (23.48)$$

With this mapping, a function of the form

$$g(\theta) = c \frac{dx(\cos \theta)}{d \cos \theta} \quad (23.49)$$

is mapped to a constant:

$$\int_{-1}^1 d \cos \theta g(\theta) = \int_0^1 dx f(x) g(\theta(x)) = \int_0^1 dx c. \quad (23.50)$$

  call msg_fatal (" Attempt to apply undefined inverse ct mapping")
end select
end subroutine mapping_compute_x_from_ct

```

Trivial mapping

This is just the mapping of the interval $(-1, 1)$ to $(0, 1)$:

$$\cos \theta = -1 + 2x \quad (23.51)$$

and

$$f(x) = 1 \quad (23.52)$$

with the inverse

$$x = \frac{1 + \cos \theta}{2} \quad (23.53)$$

```

<Apply trivial ct mapping>≡
  tmp = 2 * (1-x)
  ct = 1 - tmp
  st = sqrt (tmp * (2-tmp))
  f = 1
<Apply inverse trivial ct mapping>≡
  x = (ct + 1) / 2
  f = 1

```

Pole mapping

As above for m^2 , we simultaneously map poles at both ends of the $\cos \theta$ interval. The formulae are completely analogous:

$$\cos \theta = \begin{cases} \frac{M^2}{s} [\exp(xL) - 1] - 1 & \text{for } x < \frac{1}{2} \\ -\frac{M^2}{s} [\exp((1-x)L) - 1] + 1 & \text{for } x \geq \frac{1}{2} \end{cases} \quad (23.54)$$

where

$$L = 2 \ln \frac{M^2 + s}{M^2}. \quad (23.55)$$

Inverse:

$$x = \begin{cases} \frac{1}{2L} \ln \frac{1 + \cos \theta + M^2/s}{M^2/s} & \text{for } \cos \theta < 0 \\ 1 - \frac{1}{2L} \ln \frac{1 - \cos \theta + M^2/s}{M^2/s} & \text{for } \cos \theta \geq 0 \end{cases} \quad (23.56)$$

The phase-space factor:

$$f(x) = \begin{cases} \frac{M^2}{s} \exp(xL) L & \text{for } x < \frac{1}{2} \\ \frac{M^2}{s} \exp((1-x)L) L & \text{for } x \geq \frac{1}{2} \end{cases} \quad (23.57)$$

```

        x = 1 - log (ct1 / map%b1) / (2 * map%b2)
    end if
    f = ct1 * map%b2

```

23.3 Phase-space trees

The phase space evaluation is organized in terms of trees, where each branch corresponds to three integrations: m^2 , $\cos\theta$, and ϕ . The complete tree thus makes up a specific parameterization of the multidimensional phase-space integral. For the multi-channel integration, the phase-space tree is a single channel.

The trees imply mappings of formal Feynman tree graphs into arrays of integer numbers: Each branch, corresponding to a particular line in the graph, is assigned an integer code c (with kind value $\text{TC} = \text{tree code}$).

In this integer, each bit determines whether a particular external momentum flows through the line. The external branches therefore have codes 1, 2, 4, 8, ... An internal branch has those bits ORed corresponding to the momenta flowing through it. For example, a branch with momentum $p_1 + p_4$ has code $2^0 + 2^3 = 1 + 8 = 9$.

There is a two-fold ambiguity: Momentum conservation implies that the branch with code

$$c_0 = \sum_{i=1}^{n(\text{ext})} 2^{i-1} \quad (23.58)$$

i.e. the branch with momentum $p_1 + p_2 + \dots p_n$ has momentum zero, which is equivalent to tree code 0 by definition. Correspondingly,

$$c \quad \text{and} \quad c_0 - c = c \text{ XOR } c_0 \quad (23.59)$$

are equivalent. E.g., if there are five externals with codes $c = 1, 2, 4, 8, 16$, then $c = 9$ and $\bar{c} = 31 - 9 = 22$ are equivalent.

This ambiguity may be used to assign a direction to the line: If all momenta are understood as outgoing, $c = 9$ in the example above means $p_1 + p_4$, but $c = 22$ means $p_2 + p_3 + p_5 = -(p_1 + p_4)$.

Here we make use of the ambiguity in a slightly different way. First, the initial particles are singled out as those externals with the highest bits, the IN-bits. (Here: 8 and 16 for a $2 \rightarrow 3$ scattering process, 16 only for a $1 \rightarrow 4$ decay.) Then we invert those codes where all IN-bits are set. For a decay process this maps each tree of an equivalence class onto a unique representative (that one with the smallest integer codes). For a scattering process we proceed further:

The ambiguity remains in all branches where only one IN-bit is set, including the initial particles. If there are only externals with this property, we have an s -channel graph which we leave as it is. In all other cases, an internal with only one IN-bit is a t -channel line, which for phase space integration should be associated with one of the initial momenta as a reference axis. We take that one whose bit is set in the current tree code. (E.g., for branch $c = 9$ we use the initial particle $c = 8$ as reference axis, whereas for the same branch we would take $c = 16$ if it had been assigned $\bar{c} = 31 - 9 = 22$ as tree code.) Thus, different ways of coding the same t -channel graph imply different phase space parameterizations.

s -channel graphs have a unique parameterization. The same sets of parameterizations are used for t -channel graphs, except for the reference frames of their angular parts. We map each t -channel graph onto an s -channel graph as follows:

Working in ascending order, for each t -channel line (whose code has exactly one IN-bit set) the attached initial line is flipped upstream, while the outgoing

line is flipped downstream. (This works only if t -channel graphs are always parameterized beginning at their outer vertices, which we require as a restriction.) After all possible flips have been applied, we have an s -channel graph. We only have to remember the initial particle a vertex was originally attached to.

23.3.2 The phase-space tree type

Definition

In the concrete implementation, each branch c may have two *daughters* c_1 and c_2 such that $c_1 + c_2 = c$, a *sibling* c_s and a *mother* c_m such that $c + c_s = c_m$, and a *friend* which is kept during flips, such that it can indicate a fixed reference frame. Absent entries are set $c = 0$.

First, declare the branch type. There is some need to have this public. Give initializations for all components, so no `init` routine is necessary. The branch has some information about the associated coordinates and about connections.

```

<PHS trees: types>+≡
    type :: phs_branch_t
        private
        logical :: set = .false.
        logical :: inverted_decay = .false.
        logical :: inverted_axis = .false.
        integer(TC) :: mother = 0
        integer(TC) :: sibling = 0
        integer(TC) :: friend = 0
        integer(TC) :: origin = 0
        integer(TC), dimension(2) :: daughter = 0
        integer :: firstborn = 0
        logical :: has_children = .false.
        logical :: has_friend = .false.
        logical :: is_real = .false.
    end type phs_branch_t

```

The tree type: No initialization, this is done by `phs_tree_init`. In addition to the branch array which

The branches are collected in an array which holds all possible branches, of which only a few are set. After flips have been applied, the branch $c_M = \sum_{i=1}^{n(\text{fin})} 2^{i-1}$ must be there, indicating the mother of all decay products. In addition, we should check for consistency at the beginning.

`n_branches` is the number of those actually set. `n externals` defines the number of significant bit, and `mask` is a code where all bits are set. Analogous: `n_in` and `mask_in` for the incoming particles.

The mapping array contains the mappings associated to the branches (corresponding indices). The array `mass_sum` contains the sum of the real masses of the external final-state particles associated to the branch. During phase-space evaluation, this determines the boundaries.

```

(PHS trees: public)+≡
    public :: phs_tree_t

(PHS trees: types)+≡
    type :: phs_tree_t
    private
    integer :: n_branches, n_externals, n_in, n_msq, n_angles
    integer(TC) :: n_branches_tot, n_branches_out
    integer(TC) :: mask, mask_in, mask_out
    type(phs_branch_t), dimension(:), allocatable :: branch
    type(mapping_t), dimension(:), allocatable :: mapping
    real(default), dimension(:), allocatable :: mass_sum
    real(default), dimension(:), allocatable :: effective_mass
    real(default), dimension(:), allocatable :: effective_width
    logical :: real_phsp = .false.
    integer(TC) :: emitter = 0
    integer, dimension(:), allocatable :: momentum_link
    contains
    (PHS trees: phs tree: TBP)
end type phs_tree_t

```

The maximum number of external particles that can be represented is related to the bit size of the integer that stores binary codes. With the default integer of 32 bit on common machines, this is more than enough space. If TC is actually the default integer kind, there is no need to keep it separate, but doing so marks this as a special type of integer. So, just state that the maximum number is 32:

```

(Limits: public parameters)≡
    integer, parameter, public :: MAX_EXTERNAL = 32

```

Constructor and destructor

Allocate memory for a phase-space tree with given number of externals and incoming. The number of allocated branches can easily become large, but appears manageable for realistic cases, e.g., for `n_in=2` and `n_out=8` we get $2^{10} - 1 = 1023$.

```

(PHS trees: public)+≡
    public :: phs_tree_init
    public :: phs_tree_final

```

Here we set the masks for incoming and for all externals.

```

<PHS trees: procedures>+≡
  elemental subroutine phs_tree_init (tree, n_in, n_out, n_masses, n_angles)
    type(phs_tree_t), intent(inout) :: tree
    integer, intent(in) :: n_in, n_out, n_masses, n_angles
    integer(TC) :: i
    tree%n_externals = n_in + n_out
    tree%n_branches_tot = 2**(n_in+n_out) - 1

23.3.3 PHS tree setup

Transformation into an array of branch codes and back

Assume that the tree/array has been created before with the appropriate length and is empty.

```

<PHS trees: public>+≡
    public :: phs_tree_from_array

<PHS trees: procedures>+≡
    subroutine phs_tree_from_array (tree, a)
        type(phs_tree_t), intent(inout) :: tree
        integer(TC), dimension(:), intent(in) :: a
        integer :: i
        integer(TC) :: k
        <Set branches from array a>
        <Set external branches if necessary>
        <Check number of branches>
        <Determine the connections>
    contains
        <Subroutine: set relatives>
    end subroutine phs_tree_from_array

```

First, set all branches specified by the user. If all IN-bits are set, we invert the branch code.

```

<Set branches from array a>≡
    do i=1, size(a)
        k = a(i)
        if (iand(k, tree%mask_in) == tree%mask_in) k = ieor(tree%mask, k)
        tree%branch(k)%set = .true.
        tree%n_branches = tree%n_branches+1
    end do

```

The external branches are understood, so set them now if not yet done. In all cases ensure that the representative with one bit set is used, except for decays where the in-particle is represented by all OUT-bits set instead.

```

<Set external branches if necessary>≡
do i=0, tree%n_externals-1
  k = ibset(0,i)
  if (iand(k, tree%mask_in) == tree%mask_in) k = ieor(tree%mask, k)
  if (tree%branch(ieor(tree%mask, k))%set) then
    tree%branch(ieor(tree%mask, k))%set = .false.
    tree%branch(k)%set = .true.
  else if (.not.tree%branch(k)%set) then
    tree%branch(k)%set = .true.
    tree%n_branches = tree%n_branches+1
  end if
end do

```

Now the number of branches set can be checked. Here we assume that the tree is binary. For three externals there are three branches in total, and for each additional external branch we get another internal one.

```

<Check number of branches>≡
if (tree%n_branches /= tree%n_externals*2-3) then
  call phs_tree_write (tree)
  call msg_bug &
    & (" Wrong number of branches set in phase space tree")
end if

```

For all branches that are set, except for the externals, we try to find the daughter branches:

```

<Determine the connections>≡
do k=1, size (tree%branch)
  if (tree%branch(k)%set .and. tc_decay_level (k) /= 1) then
    call branch_set_relatives(k)
  end if
end do

```

To this end, we scan all codes less than the current code, whether we can find two branches which are set and which together give the current code. After that, the tree may still not be connected, but at least we know if a branch does not have daughters: This indicates some inconsistency.

The algorithm ensures that, at this stage, the first daughter has a smaller code value than the second one.

```

<Subroutine: set relatives>≡
subroutine branch_set_relatives (k)
  integer(TC), intent(in) :: k
  integer(TC) :: m,n
  do m=1, k-1
    if(iand(k,m)==m) then
      n = ieor(k,m)
      if ( tree%branch(m)%set .and. tree%branch(n)%set ) then
        tree%branch(k)%daughter(1) = m; tree%branch(k)%daughter(2) = n
        tree%branch(m)%mother      = k; tree%branch(n)%mother      = k
        tree%branch(m)%sibling      = n; tree%branch(n)%sibling      = m
        tree%branch(k)%has_children = .true.
      return
    end if
  end do
end subroutine

```

```

        end if
    end if
end do
call phs_tree_write (tree)
call msg_bug &
    & (" Missing daughter branch(es) in phase space tree")
end subroutine branch_set_relatives

```

The inverse: this is trivial, fortunately.

Flip t -channel into s -channel

Flipping the tree is done upwards, beginning from the decay products. First we select a t -channel branch k : one which is set, which does have an IN-bit, and which is not an external particle.

Next, we determine the adjacent in-particle (called the 'friend' f here, since it will provide the reference axis for the angular integration). In addition, we look for the 'mother' and 'sibling' of this particle. If the latter field is empty, we select the (unique) other out-particle which has no mother, calling the internal subroutine `find_orphan`.

The flip is done as follows: We assume that the first daughter d is an s -channel line, which is true if the daughters are sorted. This will stay the first daughter. The second one is a t -channel line; it is exchanged with the 'sibling' s . The new line which replaces the branch k is just the sum of s and d . In addition, we have to rearrange the relatives of s and d , as well of f .

Finally, we flip 'sibling' and 'friend' and set the new s -channel branch n which replaces the t -channel branch k . After this is complete, we are ready to execute another flip.

[Although the friend is not needed for the final flip, since it would be an initial particle anyway, we need to know whether we have t - or u -channel.]

(PHS trees: public)+≡

```
public :: phs_tree_flip_t_to_s_channel
```

(PHS trees: procedures)+≡

```

subroutine phs_tree_flip_t_to_s_channel (tree)

        call msg_bug (" Can't flip phase space tree to channel")
    end subroutine find_orphan
end subroutine phs_tree_flip_t_to_s_channel

```

After the tree has been flipped, one may need to determine what has become of a particular t -channel branch. This function gives the bincode of the flipped tree. If the original bincode does not contain IN-bits, we leave it as it is.

(PHS trees: procedures)+≡

```

function tc_flipped (tree, kt) result (ks)
    type(phs_tree_t), intent(in) :: tree
    integer(TC), intent(in) :: kt
    integer(TC) :: ks
    if (iand (kt, tree%mask_in) == 0) then
        ks = kt
    else
        ks = tree%branch(iand (kt, tree%mask_out))%mother
    end if
end function tc_flipped

```

Scan a tree and make sure that the first daughter has always a smaller code than the second one. Furthermore, delete any `friend` entry in the root branch – this branching has the incoming particle direction as axis anyway. Keep track of reordering by updating `inverted_axis`, `inverted_decay` and `firstborn`.

      call mapping_set_parameters &
        (tree%mapping(k), mapping_defaults, variable_limits)
    end do
  end subroutine phs_tree_set_mapping_parameters

```

Return the mapping for the sum of all outgoing particles. This should either be no mapping or a global s-channel mapping.

```

<PHS trees: public>+≡
  public :: phs_tree_assign_s_mapping

<PHS trees: procedures>+≡
  subroutine phs_tree_assign_s_mapping (tree, mapping)
    type(phs_tree_t), intent(in) :: tree
    type(mapping_t), intent(out) :: mapping
    mapping = tree%mapping(tree%mask_out)
  end subroutine phs_tree_assign_s_mapping

```

Kinematics

Fill the mass sum array, starting from the external particles and working down to the tree root. For each bincode k we scan the bits in k ; if only one is set, we take the physical mass of the corresponding external particle; if more than one is set, we sum up the two masses (which we know have already been set).

```

<PHS trees: public>+≡
  public :: phs_tree_set_mass_sum

<PHS trees: procedures>+≡
  subroutine phs_tree_set_mass_sum (tree, flv)
    type(phs_tree_t), intent(inout) :: tree
    type(flavor_t), dimension(:), intent(in) :: flv
    integer(TC) :: k
    integer :: i
    tree%mass_sum = 0
    do k = 1, tree%n_branches_out
      do i = 0, size(flav) - 1
        if (btest(k,i)) then
          if (ibclr(k,i) == 0) then
            tree%mass_sum(k) = flavor_get_mass (flv(i+1))
          else
            tree%mass_sum(k) = &
              tree%mass_sum(ibclr(k,i)) + tree%mass_sum(ibset(0,i))
          end if
        end if
      end do
    end do
  end subroutine phs_tree_set_mass_sum

```

```

        end do
    end do
end subroutine phs_tree_set_mass_sum

```

Set the effective masses and widths. For each non-resonant branch in a tree, the effective mass is equal to the sum of the effective masses of the children (and analogous for the width). External particles have their real mass and width zero. For resonant branches, we insert mass and width from the corresponding mapping.

This routine has `phs_tree_set_mass_sum` and `phs_tree_set_mapping_parameters` as prerequisites.

(PHS trees: public)+≡

```

public :: phs_tree_set_effective_masses

```

(PHS trees: procedures)+≡

```

subroutine phs_tree_set_effective_masses (tree)
    type(phs_tree_t), intent(inout) :: tree

            call set_masses_x (k2)
            if (mapping_is_s_channel (tree%mapping(k))) then
                tree%effective_mass(k) = mapping_get_mass (tree%mapping(k))
                tree%effective_width(k) = mapping_get_width (tree%mapping(k))
            else
                tree%effective_mass(k) = &
                    tree%effective_mass(k1) + tree%effective_mass(k2)
                tree%effective_width(k) = &
                    tree%effective_width(k1) + tree%effective_width(k2)
            end if
        else
            tree%effective_mass(k) = tree%mass_sum(k)
        end if
    end subroutine set_masses_x
end subroutine phs_tree_set_effective_masses

```

Define step mappings, recursively, for the decay products of all intermediate resonances. Step mappings account for the fact that a branch may originate from a resonance, which almost replaces the upper limit on the possible invariant mass. The step mapping implements a smooth cutoff that interpolates between the resonance and the real kinematic limit. The mapping width determines the sharpness of the cutoff.

Step mappings are inserted only for branches that are not mapped otherwise.

At each branch, we record the mass that is effectively available for phase

space, by taking the previous limit and subtracting the effective mass of the sibling branch. Widths are added, not subtracted.

If we encounter a resonance decay, we discard the previous limit and replace it by the mass and width of the resonance, also subtracting the sibling branch.

Initially, the limit is zero, so it becomes negative at any branch. Only if there is a resonance, the limit becomes positive. Whenever the limit is positive, and the current branch decays, we activate a step mapping for the current branch.

As a result, step mappings are implemented for all internal lines that originate from an intermediate resonance decay.

The flag `variable_limits` applies to the ultimate limit from the available energy, not to the intermediate resonances whose masses are always fixed.

This routine requires `phs_tree_set_effective_masses`

```

Structural comparison

This function allows to check whether one tree is the permutation of another one. The permutation is applied to the second tree in the argument list. We do not make up a temporary permuted tree, but compare the two trees directly. The branches are scanned recursively, where for each daughter we check the friend and the mapping as well. Once a discrepancy is found, the recursion is exited immediately.

23.3.4 Phase-space evaluation

Phase-space volume

We compute the phase-space volume recursively, following the same path as for computing other kinematical variables. However, the volume depends just on \sqrt{s} , not on the momentum configuration.

Note: counting branches, we may replace this by a simple formula.

```

(PHS trees: public)+≡
    public :: phs_tree_compute_volume

end subroutine phs_tree_compute_volume

```

Determine momenta

This is done in two steps: First the masses are determined. This step may fail, in which case `ok` is set to false. If successful, we generate angles and the actual momenta. The array `decay_p` serves for transferring the individual three-momenta of the daughter particles in their mother rest frame from the mass generation to the momentum generation step.

```

<PHS trees: public>+≡
    public :: phs_tree_compute_momenta_from_x

<PHS trees: procedures>+≡
    subroutine phs_tree_compute_momenta_from_x &
        (tree, prt, factor, volume, sqrts, x, ok)
        type(phs_tree_t), intent(inout) :: tree

        logical, intent(out) :: ok
        real(default), dimension(tree%mask_out) :: decay_p
        integer :: n1, n2
        integer :: n_out
        if (tree%real_phsp) then
            n_out = tree%n_externals - tree%n_in - 1
            n1 = max (n_out-2, 0)
            n2 = n1 + max (2*n_out, 0)
        else
            n1 = tree%n_msq
            n2 = n1 + tree%n_angles
        end if
        call phs_tree_set_msq &
            (tree, prt, factor, volume, decay_p, sqrts, x(1:n1), ok)
        if (ok) call phs_tree_set_angles &
            (tree, prt, factor, decay_p, sqrts, x(n1+1:n2))
    end subroutine phs_tree_compute_momenta_from_x

```

Mass generation is done recursively. The `ok` flag causes the filled tree to be discarded if set to `.false.` This happens if a three-momentum turns out to be imaginary, indicating impossible kinematics. The index `ix` tells us how far we

have used up the input array x.

```

The heart of phase space generation: Now we have the invariant masses, let us generate angles. At each branch, we take a Lorentz transformation and augment it by a boost to the current particle rest frame, and by rotations ϕ and θ around the z and y axis, respectively. This transformation is passed down to the daughter particles, if present.

This subroutine is the most time-critical part of the whole program. Therefore, we do not exactly parallel the angle generation routine above but make sure that things get evaluated only if they are really needed, at the expense of readability. Particularly important is to have as few multiplications of Lorentz transformations as possible.

23.4 The phase-space forest

Simply stated, a phase-space forest is a collection of phase-space trees. More precisely, a `phs_forest` object contains all parameterizations of phase space that `WHIZARD` will use for a single hard process, prepared in the form of `phs_tree` objects. This is suitable for evaluation by the `VAMP` integration package: each parameterization (tree) is a valid channel in the multi-channel adaptive integration, and each variable in a tree corresponds to an integration dimension, defined by an appropriate mapping of the $(0, 1)$ interval to the allowed range of the integration variable.

The trees are grouped in groves. The trees (integration channels) within a grove share a common weight, assuming that they are related by some approximate symmetry.

Trees/channels that are related by an exact symmetry are connected by an array of equivalences; each equivalence object holds the data that relate one channel to another.

The phase-space setup, i.e., the detailed structure of trees and forest, are read from a file. Therefore, this module also contains the syntax definition and the parser needed for interpreting this file.

```
(phs_forests.f90)≡

23.4.1 Phase-space setup parameters

This transparent container holds the parameters that the algorithm needs for phase-space setup, with reasonable defaults.

The threshold mass (for considering a particle as effectively massless) is specified separately for s- and t-channel. The default is to treat W and Z bosons as massive in the s-channel, but as massless in the t-channel. The b -quark is treated always massless, the t -quark always massive.

```

<PHS forests: public>≡
  public :: phs_parameters_t

<PHS forests: types>≡
  type :: phs_parameters_t
    real(default) :: sqrts = 0
    real(default) :: m_threshold_s = 50._default
    real(default) :: m_threshold_t = 100._default
    integer :: off_shell = 1
    integer :: t_channel = 2
    logical :: keep_nonresonant = .true.
  end type phs_parameters_t

```

Write phase-space parameters to file.

```

<PHS forests: public>+≡

    end function phs_parameters_ne
```

23.4.2 Equivalences

This type holds information about equivalences between phase-space trees. We make a linked list, where each node contains the two trees which are equivalent and the corresponding permutation of external particles. Two more arrays are to be filled: The permutation of mass variables and the permutation of angular variables, where the signature indicates a necessary exchange of daughter branches.

```
(PHS forests: types)+≡
  type :: equivalence_t
  private
  integer :: left, right
  type(permutation_t) :: perm
  type(permutation_t) :: msq_perm, angle_perm
  logical, dimension(:), allocatable :: angle_sig
  type(equivalence_t), pointer :: next => null ()
end type equivalence_t
```

```
(PHS forests: types)+≡
  type :: equivalence_list_t
  private
  integer :: length = 0
  type(equivalence_t), pointer :: first => null ()
  type(equivalence_t), pointer :: last => null ()
end type equivalence_list_t
```

Append an equivalence to the list

```
(PHS forests: procedures)+≡
  subroutine equivalence_list_add (eql, left, right, perm)
  type(equivalence_list_t), intent(inout) :: eql
  integer, intent(in) :: left, right
  type(permutation_t), intent(in) :: perm
  type(equivalence_t), pointer :: eq
  allocate (eq)
  eq%left = left
  eq%right = right
  eq%perm = perm
  if (associated (eql%last)) then
    eql%last%next => eq
  else
    eql%first => eq
  end if
  eql%last => eq
  eql%length = eql%length + 1
end subroutine equivalence_list_add
```

Delete the list contents. Has to be pure because it is called from an elemental subroutine.

```
(PHS forests: procedures)+≡
  pure subroutine equivalence_list_final (eql)
  type(equivalence_list_t), intent(inout) :: eql
  type(equivalence_t), pointer :: eq
```

```

do while (associated (eql%first))
  eq => eql%first
  eql%first => eql%first%next
  deallocate (eq)
end do
eql%last => null ()
eql%length = 0
end subroutine equivalence_list_final

```

Make a deep copy of the equivalence list. This allows for deep copies of groves and forests.

```

<PHS forests: interfaces>+≡
interface assignment(=)
  module procedure equivalence_list_assign
end interface

<PHS forests: procedures>+≡
subroutine equivalence_list_assign (eql_out, eql_in)
  type(equivalence_list_t), intent(out) :: eql_out
  type(equivalence_list_t), intent(in) :: eql_in
  type(equivalence_t), pointer :: eq, eq_copy
  eq => eql_in%first
  do while (associated (eq))
    allocate (eq_copy)
    eq_copy = eq
    eq_copy%next => null ()
    if (associated (eql_out%first)) then
      eql_out%last%next => eq_copy
    else
      eql_out%first => eq_copy
    end if
    eql_out%last => eq_copy
    eq => eq%next
  end do
end subroutine equivalence_list_assign

```

The number of list entries

```

<PHS forests: procedures>+≡
elemental function equivalence_list_length (eql) result (length)
  integer :: length
  type(equivalence_list_t), intent(in) :: eql
  length = eql%length
end function equivalence_list_length

```

Recursively write the equivalences list

```

<PHS forests: procedures>+≡
subroutine equivalence_list_write (eql, unit)
  type(equivalence_list_t), intent(in) :: eql
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit); if (u < 0) return
  if (associated (eql%first)) then

```

```

        call equivalence_write_rec (eq1%first, u)
    else
        write (u, *) " [empty]"
    end if
contains
recursive subroutine equivalence_write_rec (eq, u)
    type(equivalence_t), intent(in) :: eq
    integer, intent(in) :: u
    integer :: i
    write (u, "(3x,A,1x,I0,1x,I0,2x,A)", advance="no") &
        "Equivalence:", eq%left, eq%right, "Final state permutation:"
    call permutation_write (eq%perm, u)
    write (u, "(1x,12x,1x,A,1x)", advance="no") &
        "      msq permutation:  "
    call permutation_write (eq%msq_perm, u)
    write (u, "(1x,12x,1x,A,1x)", advance="no") &
        "      angle permutation:"
    call permutation_write (eq%angle_perm, u)
    write (u, "(1x,12x,1x,26x)", advance="no")
    do i = 1, size (eq%angle_sig)
        if (eq%angle_sig(i)) then
            write (u, "(1x,A)", advance="no") "+"
        else
            write (u, "(1x,A)", advance="no") "-"
        end if
    end do
    write (u, *)
    if (associated (eq%next)) call equivalence_write_rec (eq%next, u)
end subroutine equivalence_write_rec
end subroutine equivalence_list_write

```

23.4.3 Groves

A grove is a group of trees (phase-space channels) that share a common weight in the integration. Within a grove, channels can be declared equivalent, so they also share their integration grids (up to symmetries). The grove contains a list of equivalences. The `tree_count_offset` is the total number of trees of the preceding groves; when the trees are counted per forest (integration channels), the offset has to be added to all tree indices.

```

<PHS forests: types>+≡
    type :: phs_grove_t
    private
    integer :: tree_count_offset
    type(phs_tree_t), dimension(:), allocatable :: tree
    type(equivalence_list_t) :: equivalence_list
end type phs_grove_t

```

Call `phs_tree_init` which is also elemental:

```

<PHS forests: procedures>+≡
    elemental subroutine phs_grove_init &
        (grove, n_trees, n_in, n_out, n_masses, n_angles)

```

```

    type(phs_grove_t), intent(inout) :: grove
    integer, intent(in) :: n_trees, n_in, n_out, n_masses, n_angles
    grove%tree_count_offset = 0
    allocate (grove%tree (n_trees))
    call phs_tree_init (grove%tree, n_in, n_out, n_masses, n_angles)
end subroutine phs_grove_init

```

The trees do not have pointer components, thus no call to `phs_tree_final`:

```

<PHS forests: procedures>+≡
    elemental subroutine phs_grove_final (grove)
        type(phs_grove_t), intent(inout) :: grove
        deallocate (grove%tree)
        call equivalence_list_final (grove%equivalence_list)
    end subroutine phs_grove_final

```

Deep copy.

```

<PHS forests: interfaces>+≡
    interface assignment(=)
        module procedure phs_grove_assign0
        module procedure phs_grove_assign1
    end interface

<PHS forests: procedures>+≡
    subroutine phs_grove_assign0 (grove_out, grove_in)
        type(phs_grove_t), intent(out) :: grove_out
        type(phs_grove_t), intent(in) :: grove_in
        grove_out%tree_count_offset = grove_in%tree_count_offset
        if (allocated (grove_in%tree)) then
            allocate (grove_out%tree (size (grove_in%tree)))
            grove_out%tree = grove_in%tree
        end if
        grove_out%equivalence_list = grove_in%equivalence_list
    end subroutine phs_grove_assign0

    subroutine phs_grove_assign1 (grove_out, grove_in)
        type(phs_grove_t), dimension(:), intent(out) :: grove_out
        type(phs_grove_t), dimension(:), intent(in) :: grove_in
        integer :: i
        do i = 1, size (grove_in)
            call phs_grove_assign0 (grove_out(i), grove_in(i))
        end do
    end subroutine phs_grove_assign1

```

Get the global (s-channel) mappings. Implemented as a subroutine which returns an array (slice).

```

<PHS forests: procedures>+≡
    subroutine phs_grove_assign_s_mappings (grove, mapping)
        type(phs_grove_t), intent(in) :: grove
        type(mapping_t), dimension(:), intent(out) :: mapping
        integer :: i
        if (size (mapping) == size (grove%tree)) then
            do i = 1, size (mapping)

```

```

        call phs_tree_assign_s_mapping (grove%tree(i), mapping(i))
    end do
else
    call msg_bug ("phs_grove_assign_s_mappings: array size mismatch")
end if
end subroutine phs_grove_assign_s_mappings

```

23.4.4 The forest type

This is a collection of trees and associated particles. In a given tree, each branch code corresponds to a particle in the `prt` array. Furthermore, we have an array of mass sums which is independent of the decay tree and of the particular event. The mappings directly correspond to the decay trees, and the decay groves collect the trees in classes. The permutation list consists of all permutations of outgoing particles that map the decay forest onto itself.

The particle codes `flv` (one for each external particle) are needed for determining masses and such. The trees and associated information are collected in the `grove` array, together with a lookup table that associates tree indices to groves. Finally, the `prt` array serves as workspace for phase-space evaluation.

The `prt_combination` is a list of index pairs, namely the particle momenta pairs that need to be combined in order to provide all momentum combinations that the phase-space trees need to know.

```

(PHS forests: public)+≡
    public :: phs_forest_t

(PHS forests: types)+≡
    type :: phs_forest_t
    private
        integer :: n_in, n_out, n_tot
        integer :: n_masses, n_angles, n_dimensions
        integer :: n_trees, n_equivalences
        type(flavor_t), dimension(:), allocatable :: flv
        type(phs_grove_t), dimension(:), allocatable :: grove
        integer, dimension(:), allocatable :: grove_lookup
        type(phs_prt_t), dimension(:), allocatable :: prt_in
        type(phs_prt_t), dimension(:), allocatable :: prt_out
        type(phs_prt_t), dimension(:), allocatable :: prt
        integer(TC), dimension(:,:), allocatable :: prt_combination
        type(mapping_t), dimension(:), allocatable :: s_mapping
    contains
        (PHS forests: phs forest: TBP)
    end type phs_forest_t

```

The initialization merely allocates memory. We have to know how many trees there are in each grove, so we can initialize everything. The number of groves is the size of the `n_tree` array.

In the `grove_lookup` table we store the grove index that belongs to each absolute tree index. The difference between the absolute index and the relative (to the grove) index is stored, for each grove, as `tree_count_offset`.

The particle array is allocated according to the total number of branches each tree has, but not filled.

```

23.4.7 Read the phase space setup from file

The phase space setup is stored in a file. The file may be generated by the `cascades` module below, or by other means. This file has to be read and parsed to create the PHS forest as the internal phase-space representation.

Create lexer and syntax:

```

(PHS forests: procedures)+≡
  subroutine define_phs_forest_syntax (ifile)
    type(ifile_t) :: ifile
    call ifile_append (ifile, "SEQ phase_space_list = process_phase_space*")
    call ifile_append (ifile, "SEQ process_phase_space = " &
      // "process_def process_header phase_space")
    call ifile_append (ifile, "SEQ process_def = process_process_list")
    call ifile_append (ifile, "KEY process")
    call ifile_append (ifile, "LIS process_list = process_tag*")
    call ifile_append (ifile, "IDE process_tag")
    call ifile_append (ifile, "SEQ process_header = " &

```

```

// "md5sum_process = md5sum " &
// "md5sum_model_par = md5sum " &
// "md5sum_phs_config = md5sum " &
// "sqrts = real " &
// "m_threshold_s = real " &
// "m_threshold_t = real " &
// "off_shell = integer " &
// "t_channel = integer " &
// "keep_nonresonant = logical")
call ifile_append (ifile, "KEY '='")
call ifile_append (ifile, "KEY md5sum_process")
call ifile_append (ifile, "KEY md5sum_model_par")
call ifile_append (ifile, "KEY md5sum_phs_config")
call ifile_append (ifile, "KEY sqrts")
call ifile_append (ifile, "KEY m_threshold_s")
call ifile_append (ifile, "KEY m_threshold_t")
call ifile_append (ifile, "KEY off_shell")
call ifile_append (ifile, "KEY t_channel")
call ifile_append (ifile, "KEY keep_nonresonant")
call ifile_append (ifile, "QUO md5sum = '""' ... '""'")
call ifile_append (ifile, "REA real")
call ifile_append (ifile, "INT integer")
call ifile_append (ifile, "IDE logical")
call ifile_append (ifile, "SEQ phase_space = grove_def+")
call ifile_append (ifile, "SEQ grove_def = grove tree_def+")
call ifile_append (ifile, "KEY grove")
call ifile_append (ifile, "SEQ tree_def = tree bincodes mapping*")
call ifile_append (ifile, "KEY tree")
call ifile_append (ifile, "SEQ bincodes = bincodes*")
call ifile_append (ifile, "INT bincodes")
call ifile_append (ifile, "SEQ mapping = map bincodes channel pdg")
call ifile_append (ifile, "KEY map")
call ifile_append (ifile, "ALT channel = &
    &s_channel | t_channel | u_channel | &
    &collinear | infrared | radiation | on_shell")
call ifile_append (ifile, "KEY s_channel")
! call ifile_append (ifile, "KEY t_channel")    !!! Key already exists
call ifile_append (ifile, "KEY u_channel")
call ifile_append (ifile, "KEY collinear")
call ifile_append (ifile, "KEY infrared")
call ifile_append (ifile, "KEY radiation")
call ifile_append (ifile, "KEY on_shell")
call ifile_append (ifile, "INT pdg")
end subroutine define_phs_forest_syntax

```

The model-file syntax and lexer are fixed, therefore stored as module variables:

```

<PHS forests: variables>≡
    type(syntax_t), target, save :: syntax_phs_forest

<PHS forests: public>+≡
    public :: syntax_phs_forest_init

<PHS forests: procedures>+≡
    subroutine syntax_phs_forest_init ()

```

```

    type(ifile_t) :: ifile

        special_class = ["="] , &
        keyword_list = syntax_get_keyword_list_ptr (syntax_phs_forest))
end subroutine lexer_init_phs_forest

```

```

<PHS forests: public>+≡
public :: syntax_phs_forest_final

```

```

<PHS forests: procedures>+≡
subroutine syntax_phs_forest_final ()
    call syntax_final (syntax_phs_forest)
end subroutine syntax_phs_forest_final

```

```

<PHS forests: public>+≡
public :: syntax_phs_forest_write

```

```

<PHS forests: procedures>+≡
subroutine syntax_phs_forest_write (unit)
    integer, intent(in), optional :: unit
    call syntax_write (syntax_phs_forest, unit)
end subroutine syntax_phs_forest_write

```

The concrete parser and interpreter. Generate an input stream for the external `unit`, read the parse tree (with given `syntax` and `lexer`) from this stream, and transfer the contents of the parse tree to the PHS forest.

We look for the matching `process` tag, count groves and trees for initializing the forest, and fill the trees.

If the optional parameters are set, compare the parameters stored in the file to those. Set `match` true if everything agrees.

```

<PHS forests: public>+≡
public :: phs_forest_read

```

```

<PHS forests: interfaces>+≡
interface phs_forest_read
    module procedure phs_forest_read_file

23.4.8 Preparation

The trees that we read from file do not carry flavor information. This is set separately:

The flavor list must be unique for a unique set of masses; if a given particle can have different flavor, the mass must be degenerate, so we can choose one of the possible flavor combinations.

```

            end do
        end do
    end subroutine phs_forest_set_momentum_links
```

Once the parameter set is fixed, the masses and the widths of the particles are known and the `mass_sum` arrays as well as the mapping parameters can be computed. Note that order is important: we first compute the mass sums, then the ordinary mappings. The resonances obtained here determine the effective

masses, which in turn are used to implement step mappings for resonance decay products that are not mapped otherwise.

```

Generate the particle combination table. Scan all trees and merge their individual combination tables. At the end, valid entries are non-zero, and they indicate the indices of a pair of particles to be combined to a new particle. If a particle is accessible by more than one tree (this is usual), only keep the first possibility.

23.4.10 Find equivalences among phase-space trees

Scan phase space for equivalences. We generate the complete set of unique permutations for the given list of outgoing particles, and use this for scanning equivalences within each grove. We scan all pairs of trees, using all permutations. This implies that trivial equivalences are included, and equivalences between different trees are recorded twice. This is intentional.

<PHS forests: procedures>+≡

```

23.4.12 Phase-space evaluation

Given one row of the **x** parameter array and the corresponding channel index, compute first all relevant momenta and then recover the remainder of the **x** array, the Jacobians **phs_factor**, and the phase-space volume.

The output argument `ok` indicates whether this was successful.

```

(PHS forests: public)+≡
public :: phs_forest_evaluate_selected_channel

(PHS forests: procedures)+≡

23.5 Finding phase space parameterizations

If the phase space configuration is not found in the appropriate file, we should generate one.

The idea is to construct all Feynman diagrams subject to certain constraints which eliminate everything that is probably irrelevant for the integration. These Feynman diagrams (cascades) are grouped in groves by finding equivalence classes related by symmetry and ordered with respect to their importance (resonances). Finally, the result (or part of it) is written to file and used for the integration.

This module may eventually disappear and be replaced by CAML code. In particular, we need here a set of Feynman rules (vertices with particle codes, but not the factors). Thus, the module works for the Standard Model only.

Note that this module is stand-alone, it communicates to the main program only via the generated ASCII phase-space configuration file.

```

23.5.1 The mapping modes

The valid mapping modes, to be used below. We will make use of the convention that mappings of internal particles have a positive value. Only for positive values, the flavor code is propagated when combining cascades.

⟨Mapping modes⟩≡

```
integer, parameter :: &  
  & EXTERNAL_PRT = -1, &  
  & NO_MAPPING = 0, S_CHANNEL = 1, T_CHANNEL = 2, U_CHANNEL = 3, &  
  & RADIATION = 4, COLLINEAR = 5, INFRARED = 6, &  
  & STEP_MAPPING_E = 11, STEP_MAPPING_H = 12, &  
  & ON_SHELL = 99
```

⟨Cascades: parameters⟩≡

⟨Mapping modes⟩

23.5.2 The cascade type

A cascade is essentially the same as a decay tree (both definitions may be merged in a later version). It contains a linked tree of nodes, each of which representing an internal particle. In contrast to decay trees, each node has a definite particle code. These nodes need not be modified, therefore we can use pointers and do not have to copy them. Thus, physically each cascades has only a single node, the mother particle. However, to be able to compare trees quickly, we store in addition an array of binary codes which is always sorted in ascending order. This is accompanied by a corresponding list of particle codes. The index is the location of the corresponding cascade in the cascade set, this may be used to access the daughters directly.

The real mass is the particle mass belonging to the particle code. The minimal mass is the sum of the real masses of all its daughters; this is the kinematical cutoff. The effective mass may be zero if the particle mass is below a certain threshold; it may be the real mass if the particle is resonant; or it may be some other value.

The logical `t_channel` is set if this a t -channel line, while `initial` is true only for an initial particle. Note that both initial particles are also `t_channel` by definition, and that they are distinguished by the direction of the tree: One of them decays and is the root of the tree, while the other one is one of the leaves.

The cascade is a list of nodes (particles) which are linked via the `daughter` entries. The node is the mother particle of the decay cascade. Much of the information in the nodes is repeated in arrays, to be accessible more easily. The arrays will be kept sorted by binary codes.

The counter `n_off_shell` is increased for each internal line that is neither resonant nor log-enhanced. It is set to zero if the current line is resonant, since this implies on-shell particle production and subsequent decay.

The counter `n_t_channel` is non-negative once an initial particle is included in the tree: then, it counts the number of t -channel lines.

The `multiplicity` is the number of branchings to follow until all daughters are on-shell. A resonant or non-decaying particle has multiplicity one. Merging nodes, the multiplicities add unless the mother is a resonance. An initial or final node has multiplicity zero.

The arrays correspond to the subnode tree `tree` of the current cascade. PDG codes are stored only for those positions which are resonant, with the exception of the last entry, i.e., the current node. Other positions, in particular external legs, are assigned undefined PDG code.

A cascade is uniquely identified by its tree, the tree of PDG codes, and the tree of mappings. The tree of resonances is kept only to mask the PDG tree as described above.

$\langle \text{Cascades: types} \rangle \equiv$

```

23.5.3 Creating new cascades

This initializes a single-particle cascade (external, final state). The PDG entry in the tree is set undefined because the cascade is not resonant. However, the flavor entry is set, so the cascade flavor is identified nevertheless.

(Cascades: procedures)+≡

```

subroutine cascade_init_outgoing (cascade, flv, pos, m_thr)
    type(cascade_t), intent(out) :: cascade
    type(flavor_t), intent(in) :: flv
    integer, intent(in) :: pos

```

```

real(default), intent(in) :: m_thr
call cascade_init (cascade, 1)
cascade%bincode = ibset (0_TC, pos-1)
cascade%flv = flv
cascade%pdg = abs (flavor_get_pdg (cascade%flv))
cascade%is_vector = flavor_get_spin_type (flv) == VECTOR
cascade%m_min = flavor_get_mass (flv)
cascade%m_rea = cascade%m_min
if (cascade%m_rea >= m_thr) then
    cascade%m_eff = cascade%m_rea
end if
cascade%on_shell = .true.
cascade%multiplicity = 1
cascade%tree(1) = cascade%bincode
cascade%tree_pdg(1) = cascade%pdg
cascade%tree_mapping(1) = EXTERNAL_PRT
cascade%tree_resonant(1) = .false.
end subroutine cascade_init_outgoing

```

The same for an incoming line:

```

<Cascades: procedures>+=
subroutine cascade_init_incoming (cascade, flv, pos, m_thr)
    type(cascade_t), intent(out) :: cascade
    type(flavor_t), intent(in) :: flv
    integer, intent(in) :: pos
    real(default), intent(in) :: m_thr
    call cascade_init (cascade, 1)
    cascade%incoming = .true.
    cascade%bincode = ibset (0_TC, pos-1)
    cascade%flv = flavor_anti (flv)
    cascade%pdg = abs (flavor_get_pdg (flv))
    cascade%is_vector = flavor_get_spin_type (flv) == VECTOR
    cascade%m_min = flavor_get_mass (flv)
    cascade%m_rea = cascade%m_min
    if (cascade%m_rea >= m_thr) then
        cascade%m_eff = cascade%m_rea
    end if
    cascade%on_shell = .true.
    cascade%n_t_channel = 0
    cascade%n_off_shell = 0
    cascade%tree(1) = cascade%bincode
    cascade%tree_pdg(1) = cascade%pdg
    cascade%tree_mapping(1) = EXTERNAL_PRT
    cascade%tree_resonant(1) = .false.
end subroutine cascade_init_incoming

```

23.5.4 Tools

This function returns true if the two cascades share no common external particle. This is a requirement for joining them.

```

<Cascades: interfaces>≡
interface operator(.disjunct.)

```

```

    module procedure cascade_disjunct
end interface

```

```

<Cascades: procedures>+=
function cascade_disjunct (cascade1, cascade2) result (flag)
    logical :: flag
    type(cascade_t), intent(in) :: cascade1, cascade2
    flag = iand (cascade1%bincode, cascade2%bincode) == 0
end function cascade_disjunct

```

Compute a hash code for the resonance pattern of a cascade. We count the number of times each particle appears as a resonance.

We pack the PDG codes of the resonances in two arrays (s-channel and t-channel), sort them both, concatenate the results, transfer to i8 integers, and compute the hash code from this byte stream.

```

<Cascades: procedures>+=
subroutine cascade_assign_resonance_hash (cascade)
    type(cascade_t), intent(inout) :: cascade
    integer(i8), dimension(1) :: mold
    cascade%res_hash = hash (transfer &
        (concat (sort (pack (cascade%tree_pdg, &
            cascade%tree_resonant)), &
            sort (pack (cascade%tree_pdg, &
                cascade%tree_mapping == T_CHANNEL .or. &
                cascade%tree_mapping == U_CHANNEL))), &
        mold))
end subroutine cascade_assign_resonance_hash

```

23.5.5 Hash entries for cascades

We will set up a hash array which contains keys of and pointers to cascades. We hold a list of cascade (pointers) within each bucket. This is not for collision resolution, but for keeping similar, but unequal cascades together.

```

<Cascades: types>+=
type :: cascade_p
    type(cascade_t), pointer :: cascade => null ()
    type(cascade_p), pointer :: next => null ()
end type cascade_p

```

Here is the bucket or hash entry type:

```

<Cascades: types>+=
type :: hash_entry_t
    integer(i32) :: hashval = 0
    integer(i8), dimension(:), allocatable :: key
    type(cascade_p), pointer :: first => null ()
    type(cascade_p), pointer :: last => null ()
end type hash_entry_t

```

Finalize: just deallocate the list; the contents are just pointers.

```

(Cascades: procedures)+=
subroutine hash_entry_final (hash_entry)
  type(hash_entry_t), intent(inout) :: hash_entry
  type(cascade_p), pointer :: current
  do while (associated (hash_entry%first))
    current => hash_entry%first
    hash_entry%first => current%next
    deallocate (current)
  end do
end subroutine hash_entry_final

```

Output: concise format for debugging, just list cascade indices.

```

(Cascades: procedures)+=
subroutine hash_entry_write (hash_entry, unit)
  type(hash_entry_t), intent(in) :: hash_entry
  integer, intent(in), optional :: unit
  type(cascade_p), pointer :: current
  integer :: u, i
  u = given_output_unit (unit); if (u < 0) return
  write (u, "(1x,A)", advance="no") "Entry:"
  do i = 1, size (hash_entry%key)
    write (u, "(1x,I0)", advance="no") hash_entry%key(i)
  end do
  write (u, "(1x,A)", advance="no") "->"
  current => hash_entry%first
  do while (associated (current))
    write (u, "(1x,I7)", advance="no") current%cascade%index
    current => current%next
  end do
  write (u, *)
end subroutine hash_entry_write

```

This function adds a cascade pointer to the bucket. If ok is present, check first if it is already there and return failure if yes. If `cascade_ptr` is also present, set it to the current cascade if successful. If not, set it to the cascade that is already there.

```

(Cascades: procedures)+=
subroutine hash_entry_add_cascade_ptr (hash_entry, cascade, ok, cascade_ptr)
  type(hash_entry_t), intent(inout) :: hash_entry
  type(cascade_t), intent(in), target :: cascade
  logical, intent(out), optional :: ok
  type(cascade_t), optional, pointer :: cascade_ptr
  type(cascade_p), pointer :: current
  if (present (ok)) then
    call hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
    if (.not. ok) return
  end if
  allocate (current)
  current%cascade => cascade
  if (associated (hash_entry%last)) then
    hash_entry%last%next => current
  end if
end subroutine hash_entry_add_cascade_ptr

```

```

else
    hash_entry%first => current
end if
hash_entry%last => current
end subroutine hash_entry_add_cascade_ptr

```

This function checks whether a cascade is already in the bucket. For incomplete cascades, we look for an exact match. It should suffice to verify the tree, the PDG codes, and the mapping modes. This is the information that is written to the phase space file.

For complete cascades, we ignore the PDG code at positions with mappings infrared, collinear, or t/u-channel. Thus a cascade which is distinguished only by PDG code at such places, is flagged existent. If the convention is followed that light particles come before heavier ones (in the model definition), this ensures that the lightest particle is kept in the appropriate place, corresponding to the strongest peak.

For external cascades (incoming/outgoing) we take the PDG code into account even though it is zeroed in the PDG-code tree.

(Cascades: procedures)+≡

```

subroutine hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
    type(hash_entry_t), intent(in), target :: hash_entry
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out) :: ok
    type(cascade_ptr), optional, pointer :: cascade_ptr
    type(cascade_p), pointer :: current
    integer, dimension(:), allocatable :: tree_pdg
    ok = .true.
    allocate (tree_pdg (size (cascade%tree_pdg)))
    if (cascade%complete) then
        where (cascade%tree_mapping == INFRARED .or. &
             cascade%tree_mapping == COLLINEAR .or. &
             cascade%tree_mapping == T_CHANNEL .or. &
             cascade%tree_mapping == U_CHANNEL)
            tree_pdg = 0
        elsewhere
            tree_pdg = cascade%tree_pdg
        end where
    else
        tree_pdg = cascade%tree_pdg
    end if
    current => hash_entry%first
    do while (associated (current))
        if (current%cascade%depth == cascade%depth) then
            if (all (current%cascade%tree == cascade%tree)) then
                if (all (current%cascade%tree_mapping == cascade%tree_mapping)) &
                    then
                    if (all (current%cascade%tree_pdg .match. tree_pdg)) then
                        if (present (cascade_ptr)) cascade_ptr => current%cascade
                        ok = .false.; return
                    end if
                end if
            end if
        end if
    end if
end if
end if
end if

```

```

        current => current%next
    end do
    if (present (cascade_ptr)) cascade_ptr => cascade
end subroutine hash_entry_check_cascade

```

For PDG codes, we specify that the undefined code matches any code. This is already defined for flavor objects, but here we need it for the codes themselves.

```

<Cascades: interfaces>+≡
    interface operator(.match.)
        module procedure pdg_match
    end interface

<Cascades: procedures>+≡

            end select
        end select
    end function pdg_match

```

23.5.6 The cascade set

The cascade set will later be transformed into the decay forest. It is set up as a linked list. In addition to the usual **first** and **last** pointers, there is a **first_t** pointer which points to the first t-channel cascade (after all s-channel cascades), and a **first_k** pointer which points to the first final cascade (with a keystone).

As an auxiliary device, the object contains a hash array with associated parameters where an additional pointer is stored for each cascade. The keys are made from the relevant cascade data. This hash is used for fast detection (and thus avoidance) of double entries in the cascade list.

```

<Cascades: public>≡
    public :: cascade_set_t

<Cascades: types>+≡
    type :: cascade_set_t
        private
        class(model_data_t), pointer :: model
        integer :: n_in, n_out, n_tot
        type(flavor_t), dimension(:,,:), allocatable :: flv
        integer :: depth_out, depth_tot
        real(default) :: sqrts = 0
        real(default) :: m_threshold_s = 0
        real(default) :: m_threshold_t = 0
    end type

```

```

integer :: off_shell = 0
integer :: t_channel = 0
logical :: keep_nonresonant
integer :: n_groves = 0
! The cascade list
type(cascade_t), pointer :: first => null ()
type(cascade_t), pointer :: last => null ()
type(cascade_t), pointer :: first_t => null ()
type(cascade_t), pointer :: first_k => null ()
! The hashtable
integer :: n_entries = 0
real :: fill_ratio = 0
integer :: n_entries_max = 0
integer(i32) :: mask = 0
logical :: fatal_beam_decay = .true.
type(hash_entry_t), dimension(:), allocatable :: entry
end type cascade_set_t

```

Return true if there are cascades which are active and complete, so the phase space file would be nonempty.

```

<Cascades: public>+≡
public :: cascade_set_is_valid

<Cascades: procedures>+≡
function cascade_set_is_valid (cascade_set) result (flag)
logical :: flag
type(cascade_set_t), intent(in) :: cascade_set
type(cascade_t), pointer :: cascade
flag = .false.
cascade => cascade_set%first_k
do while (associated (cascade))
    if (cascade%active .and. cascade%complete) then
        flag = .true.
        return
    end if
    cascade => cascade%next
end do
end function cascade_set_is_valid

```

The initializer sets up the hash table with some initial size guessed by looking at the number of external particles. We choose 256 for 3 external particles and a factor of 4 for each additional particle, limited at $2^{30}=1\text{G}$.

```

23.5.7 Adding cascades

Add a deep copy of a cascade to the set. The copy has all content of the original, but the pointers are nullified. We do not care whether insertion was successful or not. The pointer argument, if present, is assigned to the input cascade, or to the hash entry if it is already present.

The procedure is recursive: any daughter or mother entries are also deep-copied and added to the cascade set before the current copy is added.

```

<Cascades: procedures>+=
recursive subroutine cascade_set_add_copy &
    (cascade_set, cascade_in, cascade_ptr)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in) :: cascade_in
    type(cascade_t), optional, pointer :: cascade_ptr
    type(cascade_t), pointer :: cascade
    logical :: ok
    allocate (cascade)
    cascade = cascade_in
    if (associated (cascade_in%daughter1)) call cascade_set_add_copy &
        (cascade_set, cascade_in%daughter1, cascade%daughter1)
    if (associated (cascade_in%daughter2)) call cascade_set_add_copy &
        (cascade_set, cascade_in%daughter2, cascade%daughter2)
    if (associated (cascade_in%mother)) call cascade_set_add_copy &
        (cascade_set, cascade_in%mother, cascade%mother)
    cascade%next => null ()
    call cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
    if (.not. ok) deallocate (cascade)
end subroutine cascade_set_add_copy

```

Add a cascade to the set. This does not deep-copy. We first try to insert it in the hash array. If successful, add it to the list. Failure indicates that it is already present, and we drop it.

The hash key is built solely from the tree array, so neither particle codes nor resonances count, just topology.

Technically, hash and list receive only pointers, so the cascade can be considered as being in either of both. We treat it as part of the list.

```

<Cascades: procedures>+=
subroutine cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out) :: ok
    type(cascade_t), optional, pointer :: cascade_ptr
    integer(i8), dimension(1) :: mold
    call cascade_set_hash_insert &
        (cascade_set, transfer (cascade%tree, mold), cascade, ok, cascade_ptr)
    if (ok) call cascade_set_list_add (cascade_set, cascade)

```

```
end subroutine cascade_set_add
```

Add a new cascade to the list:

```
(Cascades: procedures) +=
  subroutine cascade_set_list_add (cascade_set, cascade)
    type(cascade_set_t), intent(inout) :: cascade_set
    type(cascade_t), intent(in), target :: cascade
    if (associated (cascade_set%last)) then
      cascade_set%last%next => cascade
    else
      cascade_set%first => cascade
    end if
    cascade_set%last => cascade
  end subroutine cascade_set_list_add
```

Add a cascade entry to the hash array:

```
(Cascades: procedures) +=
  subroutine cascade_set_hash_insert &
    (cascade_set, key, cascade, ok, cascade_ptr)
    type(cascade_set_t), intent(inout), target :: cascade_set
    integer(i8), dimension(:), intent(in) :: key
    type(cascade_t), intent(in), target :: cascade
    logical, intent(out) :: ok
    type(cascade_ptr), optional, pointer :: cascade_ptr
    integer(i32) :: h
    if (cascade_set%n_entries >= cascade_set%n_entries_max) &
      call cascade_set_hash_expand (cascade_set)
    h = hash (key)
    call cascade_set_hash_insert_rec &
      (cascade_set, h, h, key, cascade, ok, cascade_ptr)
  end subroutine cascade_set_hash_insert
```

Double the hashtable size when necessary:

```
(Cascades: procedures) +=
  subroutine cascade_set_hash_expand (cascade_set)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(hash_entry_t), dimension(:), allocatable, target :: table_tmp
    type(cascade_ptr), pointer :: current
    integer :: i, s
    allocate (table_tmp (0:cascade_set%mask))
    table_tmp = cascade_set%entry
    deallocate (cascade_set%entry)
    s = 2 * size (table_tmp)
    cascade_set%n_entries = 0
    cascade_set%n_entries_max = s * cascade_set%fill_ratio
    cascade_set%mask = s - 1
    allocate (cascade_set%entry (0:cascade_set%mask))
    do i = 0, ubound (table_tmp, 1)
      current => table_tmp(i)%first
      do while (associated (current))
        call cascade_set_hash_insert_rec &
          (cascade_set, table_tmp(i)%hashval, table_tmp(i)%hashval, &
```

```

        table_tmp(i)%key, current%cascade)
    current => current%next
end do
end do
end subroutine cascade_set_hash_expand

```

Insert the cascade at the bucket determined by the hash value. If the bucket is filled, check first for a collision (unequal keys). In that case, choose the following bucket and repeat. Otherwise, add the cascade to the bucket.

If the bucket is empty, record the hash value, allocate and store the key, and then add the cascade to the bucket.

If `ok` is present, before insertion we check whether the cascade is already stored, and return failure if yes.

(Cascades: procedures)+≡

```

recursive subroutine cascade_set_hash_insert_rec &
    (cascade_set, h, hashval, key, cascade, ok, cascade_ptr)
type(cascade_set_t), intent(inout) :: cascade_set

23.5.8 External particles

We want to initialize the cascade set with the outgoing particles. In case of multiple processes, initial cascades are prepared for all of them. The hash array check ensures that no particle appears more than once at the same place.

(Cascades: interfaces)+≡

```

interface cascade_set_add_outgoing
  module procedure cascade_set_add_outgoing1
  module procedure cascade_set_add_outgoing2
end interface

```

<Cascades: procedures>+≡

```

subroutine cascade_set_add_outgoing2 (cascade_set, flv)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(flavor_t), dimension(:,:), intent(in) :: flv
  integer :: pos, prc, n_out, n_prc
  type(cascade_t), pointer :: cascade
  logical :: ok
  n_out = size (flv, dim=1)
  n_prc = size (flv, dim=2)
  do prc = 1, n_prc
    do pos = 1, n_out
      allocate (cascade)
      call cascade_init_outgoing &
        (cascade, flv(pos,prc), pos, cascade_set%m_threshold_s)
      call cascade_set_add (cascade_set, cascade, ok)
      if (.not. ok) then
        deallocate (cascade)
      end if
    end do
  end do
end subroutine cascade_set_add_outgoing2

subroutine cascade_set_add_outgoing1 (cascade_set, flv)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(flavor_t), dimension(:), intent(in) :: flv
  integer :: pos, n_out
  type(cascade_t), pointer :: cascade
  logical :: ok
  n_out = size (flv, dim=1)
  do pos = 1, n_out
    allocate (cascade)
    call cascade_init_outgoing &
      (cascade, flv(pos), pos, cascade_set%m_threshold_s)

    if (.not. ok) then
      deallocate (cascade)
    end if
  end do
end subroutine cascade_set_add_outgoing1

```

The incoming particles are added one at a time. Nevertheless, we may have several processes which are looped over. At the first opportunity, we set the pointer `first_t` in the cascade set which should point to the first t-channel cascade.

Return the indices of the first and last cascade generated.

<Cascades: interfaces>+≡

```

23.5.9 Cascade combination I: flavor assignment

We have two disjunct cascades, now use the vertex table to determine the possible flavors of the combination cascade. For each possibility, try to generate a new cascade. The total cascade depth has to be one less than the limit, because this is reached by setting the keystone.

```
(Cascades: procedures) +=
  subroutine cascade_match_pair (cascade_set, cascade1, cascade2, s_channel)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in), target :: cascade1, cascade2
    logical, intent(in) :: s_channel
    integer, dimension(:), allocatable :: pdg3
    integer :: i, depth_max
    type(flavor_t) :: flv
    if (s_channel) then
      depth_max = cascade_set%depth_out
    else
      depth_max = cascade_set%depth_tot
    end if
    if (cascade1%depth + cascade2%depth < depth_max) then
      call cascade_set%model%match_vertex ( &
        flavor_get_pdg (cascade1%flv), &
        flavor_get_pdg (cascade2%flv), &
        pdg3)
      do i = 1, size (pdg3)
        call flavor_init (flv, pdg3(i), cascade_set%model)
        if (s_channel) then
          call cascade_combine_s (cascade_set, cascade1, cascade2, flv)
        else
          call cascade_combine_t (cascade_set, cascade1, cascade2, flv)
        end if
      end do
      deallocate (pdg3)
    end if
  end subroutine cascade_match_pair
```

The triplet version takes a third cascade, and we check whether this triplet has a matching vertex in the database. If yes, we make a keystone cascade.

```
(Cascades: procedures) +=
  subroutine cascade_match_triplet &
    (cascade_set, cascade1, cascade2, cascade3, s_channel)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), intent(in), target :: cascade1, cascade2, cascade3
    logical, intent(in) :: s_channel
    integer :: depth_max
    depth_max = cascade_set%depth_tot
    if (cascade1%depth + cascade2%depth + cascade3%depth == depth_max) then
      if (cascade_set%model%check_vertex ( &
        flavor_get_pdg (cascade1%flv), &
```

```

        flavor_get_pdg (cascade2%flv), &
        flavor_get_pdg (cascade3%flv))) then
    call cascade_combine_keystone &
        (cascade_set, cascade1, cascade2, cascade3, s_channel)
    end if
end if
end subroutine cascade_match_triplet

```

23.5.10 Cascade combination II: kinematics setup and check

Having three matching flavors, we start constructing the combination cascade. We look at the mass hierarchies and determine whether the cascade is to be kept. In passing we set mapping modes, resonance properties and such.

If successful, the cascade is finalized. For a resonant cascade, we prepare in addition a copy without the resonance.

```

Here we complete a decay cascade. The third input is the single-particle cascade for the initial particle. There is no resonance or mapping assignment. The only condition for keeping the cascade is the mass sum of the final state, which must be less than the available energy.

Two modifications are necessary for scattering cascades: a pure s-channel diagram (cascade1 is the incoming particle) do not have a logarithmic mapping at top-level. And in a t-channel diagram, the last line exchanged is mapped t-channel, not u-channel. Finally, we can encounter the case of a $2 \rightarrow 1$ process, where cascade1 is incoming, and cascade2 is the outgoing particle. In all three cases we register a new cascade with the modified mapping.

```

23.5.11 Cascade combination III: node connections and tree fusion

Here we assign global tree properties. If the allowed number of off-shell lines is exceeded, discard the new cascade. Otherwise, assign the trees, sort them, and assign connections. Finally, append the cascade to the list. This may fail (because in the hash array there is already an equivalent cascade). On failure, discard the cascade.

```

  resonant(i) = resonant_tmp (pos(1))
  tree_tmp(pos(1)) = 0
end do
end subroutine tree_sort

```

23.5.12 Cascade set generation

These procedures loop over cascades and build up the cascade set. After each iteration of the innermost loop, we set a breakpoint.

s-channel: We use a nested scan to combine all cascades with all other cascades.

```

<Cascades: procedures>+≡
subroutine cascade_set_generate_s (cascade_set)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), pointer :: cascade1, cascade2
  cascade1 => cascade_set%first
  LOOP1: do while (associated (cascade1))
    cascade2 => cascade_set%first
    LOOP2: do while (associated (cascade2))
      if (cascade2%index >= cascade1%index) exit LOOP2
      if (cascade1 .disjunct. cascade2) then
        call cascade_match_pair (cascade_set, cascade1, cascade2, .true.)
      end if
      call terminate_now_if_signal ()
      cascade2 => cascade2%next
    end do LOOP2
    cascade1 => cascade1%next
  end do LOOP1
end subroutine cascade_set_generate_s

```

The t-channel cascades are directed and have a seed (one of the incoming particles) and a target (the other one). We loop over all possible seeds and targets. Inside this, we loop over all t-channel cascades (*cascade1*) and s-channel cascades (*cascade2*) and try to combine them.

```

<Cascades: procedures>+≡
subroutine cascade_set_generate_t (cascade_set, pos_seed, pos_target)
  type(cascade_set_t), intent(inout), target :: cascade_set
  integer, intent(in) :: pos_seed, pos_target

```

23.5.13 Groves

Before assigning groves, assign hashcodes to the resonance patterns, so they can easily be compared.

(Cascades: procedures)+≡

```

subroutine cascade_set_assign_resonance_hash (cascade_set)
    type(cascade_set_t), intent(inout) :: cascade_set
    type(cascade_t), pointer :: cascade
    cascade => cascade_set%first_k
    do while (associated (cascade))
        call cascade_assign_resonance_hash (cascade)
        cascade => cascade%next
    end do
end subroutine cascade_set_assign_resonance_hash

```

After all cascades are recorded, we group the complete cascades in groves. A grove consists of cascades with identical multiplicity, number of resonances, log-enhanced, t-channel lines, and resonance flavors.

(Cascades: procedures)+≡

```

subroutine cascade_set_assign_groves (cascade_set)
    type(cascade_set_t), intent(inout), target :: cascade_set
    type(cascade_t), pointer :: cascade1, cascade2
    integer :: multiplicity
    integer :: n_resonances, n_log_enhanced, n_t_channel, n_off_shell
    integer :: res_hash
    integer :: grove
    grove = 0
    cascade1 => cascade_set%first_k
    do while (associated (cascade1))
        if (cascade1%active .and. cascade1%complete &
            .and. cascade1%grove == 0) then

            n_log_enhanced = cascade1%n_log_enhanced
            n_off_shell = cascade1%n_off_shell

```

```

n_t_channel = cascade1%n_t_channel
res_hash = cascade1%res_hash
cascade2 => cascade1%next
do while (associated (cascade2))
  if (cascade2%grove == 0) then
    if (cascade2%multiplicity == multiplicity &
        .and. cascade2%n_resonances == n_resonances &
        .and. cascade2%n_log_enhanced == n_log_enhanced &
        .and. cascade2%n_off_shell == n_off_shell &
        .and. cascade2%n_t_channel == n_t_channel &
        .and. cascade2%res_hash == res_hash) then
      cascade2%grove = grove
    end if
  end if
  call terminate_now_if_signal ()
  cascade2 => cascade2%next
end do
end if
call terminate_now_if_signal ()
cascade1 => cascade1%next
end do
cascade_set%n_groves = grove
end subroutine cascade_set_assign_groves

```

23.5.14 Generate the phase space file

Generate a complete phase space configuration.

For each flavor assignment: First, all s-channel graphs that can be built up from the outgoing particles. Then we distinguish (1) decay, where we complete the s-channel graphs by connecting to the input line, and (2) scattering, where we now generate t-channel graphs by introducing an incoming particle, and complete this by connecting to the other incoming particle.

After all cascade sets have been generated, merge them into a common set. This eliminates redundancies between flavor assignments.

```

<Cascades: public>+≡
  public :: cascade_set_generate

<Cascades: procedures>+≡
  subroutine cascade_set_generate &
    (cascade_set, model, n_in, n_out, flv, phs_par, fatal_beam_decay)

23.6 WOOD phase space

This is the module that interfaces the `phs_forests` phase-space treatment and the `cascades` module for generating phase-space channels. As an extension of

the `phs_base` abstract type, the phase-space configuration and instance implement the standard API.

(Currently, this is the only generic phase-space implementation of WHIZARD. For trivial two-particle phase space, there is `phs_wood` as an alternative.)

```

<phs_wood.f90>≡
  <File header>

  module phs_wood

23.6.3 Phase-space configuration

We read the phase-space configuration from the stored I/O unit. If this is not set, we assume that we have to generate a phase space configuration. When done, we open a scratch file and write the configuration.

If `rebuild` is set, we should trash any existing phase space file and build a new one. Otherwise, we try to use an old one, which we check for existence and integrity. If `ignore_mismatch` is set, we reuse an existing file even if it does not match the current setup.

```

The MD5 sum of the forest is computed in addition to the MD5 sum of the configuration. The reason is that the forest may depend on a user-provided external file. On the other hand, this MD5 sum encodes all information that is relevant for further processing. Therefore, the `get_md5sum` method returns this result, once it is available.

```

      end select
  end subroutine phs_wood_init
```

23.6.5 Evaluation

We compute the outgoing momenta from the incoming momenta and the input parameter set `r_in` in channel `r_in`. We also compute the `r` parameters and Jacobians `f` for all other channels.

We do *not* need to apply a transformation from/to the c.m. frame, because in `phs_base` the momenta are already boosted to the c.m. frame before assigning them in the `phs` object, and inversely boosted when extracting them.

```

Chapter 24

Random-Number Generator Implementation

The integration and event generation modules need a random-number generator. Here, we provide a concrete implementation.

Module `rng_tao`: Implementation as an interface to the TAO random number generator which the VAMP package provides.

24.1 TAO Random-Number Generator

This module provides an implementation for the generic random-number generator. Actually, we interface the TAO random-number generator which is available via the VAMP package.

```
<rng_tao.f90>≡  
<File header>  
  
module rng_tao  
  
    use kinds  
    use io_units  
    use format_utils, only: write_indent  
    use unit_tests  
    use tao_random_numbers !NODEP!  
  
    use rng_base  
  
<Standard module head>  
  
<RNG tao: public>  
  
<RNG tao: types>  
  
contains  
  
<RNG tao: procedures>
```

```
⟨RNG tao: tests⟩
```

```
end module rng_tao
```

24.1.1 Generator type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

We keep the seed, in case we want to recover it later, and count the number of calls since seeding.

```
⟨RNG tao: public⟩≡
  public :: rng_tao_t

⟨RNG tao: types⟩≡
  type, extends (rng_t) :: rng_tao_t
    integer :: seed = 0
    integer :: n_calls = 0
    type(tao_random_state) :: state
  contains
    ⟨RNG tao: rng tao: TBP⟩
  end type rng_tao_t
```

Output: Display seed and number of calls.

```
⟨RNG tao: rng tao: TBP⟩≡
  procedure :: write => rng_tao_write

⟨RNG tao: procedures⟩≡
  subroutine rng_tao_write (rng, unit, indent)
    class(rng_tao_t), intent(in) :: rng
    integer, intent(in), optional :: unit, indent
    integer :: u, ind
    u = given_output_unit (unit)
    ind = 0; if (present (indent)) ind = indent
    call write_indent (u, ind)
    write (u, "(A)") "TA0 random-number generator:"
    call write_indent (u, ind)
    write (u, "(2x,A,I0)") "seed = ", rng%seed
    call write_indent (u, ind)
    write (u, "(2x,A,I0)") "calls = ", rng%n_calls
  end subroutine rng_tao_write
```

The init method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

The seed may be omitted. The default seed is 0.

```
⟨RNG tao: rng tao: TBP⟩+≡
  procedure :: init => rng_tao_init

⟨RNG tao: procedures⟩+≡
  subroutine rng_tao_init (rng, seed)
    class(rng_tao_t), intent(out) :: rng
    integer, intent(in), optional :: seed
    if (present (seed)) rng%seed = seed
    call tao_random_create (rng%state, rng%seed)
```

```
end subroutine rng_tao_init
```

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

```
<RNG tao: rng tao: TBP>+≡
  procedure :: final => rng_tao_final
<RNG tao: procedures>+≡
  subroutine rng_tao_final (rng)
    class(rng_tao_t), intent(inout) :: rng
    call tao_random_destroy (rng%state)
  end subroutine rng_tao_final
```

These routines generate a single and an array of default-precision random numbers, respectively.

We have to convert from explicit double to abstract default precision. Under normal conditions, both are equivalent, however. Unless, someone decides to do single precision, there is always an interface for `tao_random_numbers`.

```
<RNG tao: rng tao: TBP>+≡
  procedure :: generate_single => rng_tao_generate_single
  procedure :: generate_array => rng_tao_generate_array
<RNG tao: procedures>+≡
  subroutine rng_tao_generate_single (rng, x)
    class(rng_tao_t), intent(inout) :: rng
    real(default), intent(out) :: x
    real(default) :: r
    call tao_random_number (rng%state, r)
    x = r
    rng%n_calls = rng%n_calls + 1
  end subroutine rng_tao_generate_single

  subroutine rng_tao_generate_array (rng, x)
    class(rng_tao_t), intent(inout) :: rng
    real(default), dimension(:), intent(out) :: x
    real(default) :: r
    integer :: i
    do i = 1, size (x)
      call tao_random_number (rng%state, r)
      x(i) = r
    end do
    rng%n_calls = rng%n_calls + size (x)
  end subroutine rng_tao_generate_array
```

Factory

This factory makes `rng_tao_t` generators, initialized with the seeds

$$s_i = s_0 * 2^{16} + i \quad (24.1)$$

where s_0 is the seed (a 16-bit integer) given to the factory object, and i is the index in the generated sequence of generators, starting with zero.

```
<RNG tao: public>+≡
```

```

    public :: rng_tao_factory_t
  <RNG tao: types>+≡
    type, extends (rng_factory_t) :: rng_tao_factory_t
      integer(i16) :: s = 0
      integer(i16) :: i = 0
    contains
      <RNG tao: rng tao factory: TBP>
    end type rng_tao_factory_t

```

Output.

```

  <RNG tao: rng tao factory: TBP>≡
    procedure :: write => rng_tao_factory_write
  <RNG tao: procedures>+≡
    subroutine rng_tao_factory_write (object, unit)
      class(rng_tao_factory_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A,2(IO,A))") &
        "RNG factory: tao (", object%s, ",", object%i, ")"
    end subroutine rng_tao_factory_write

```

Initialize, translating the given seed.

```

  <RNG tao: rng tao factory: TBP>+≡

Table 25.1: List of singular regions. The particles are represented by their PDG codes. The third column contains the emitter for the specific singular region. For the process involving an additional gluon, the gluon can either be emitted from one of the quarks or from the first gluon. Each emitter yields the same list of fundamental tuples, five in total. The last singular region corresponds to the process where the gluon splits up into two quarks. Here, there is only one fundamental tuple, corresponding to a singular configuration of the momenta of the additional quarks.

25.2 Identifying singular regions

In the FKS subtraction scheme, the phase space is decomposed into disjoint singular regions, such that

$$\sum_i \mathcal{S}_i + \sum_{ij} \mathcal{S}_{ij} = 1. \quad (25.1)$$

The quantities \mathcal{S}_i and \mathcal{S}_{ij} are functions of phase space corresponding to a pair of particles indices which can make up a divergent phase space region. We call such an index pair a fundamental tuple. For example, the process $e^+ e^- \rightarrow u \bar{u} g$ has two singular regions, (3, 5) and (4, 5), indicating that the gluon can be soft or collinear with respect to either the quark or the anti-quark. Therefore, the functions \mathcal{S}_{ij} have to be chosen in such a way that their contribution makes up most of (25.1) in phase-space configurations where (final-state) particle j is collinear to particle i or/and particle j is soft. The functions \mathcal{S}_i is the corresponding quantity for initial-state divergences.

As a singular region we understand the collection of real flavor structures associated with an emitter and a list of all possible fundamental tuples. As an example, consider the process $e^+ e^- \rightarrow u \bar{u} g$. At next-to-leading order, processes with an additionally radiated particle have to be considered. In this case, these are $e^+ e^- \rightarrow u \bar{u}, g g$, and $e^+ e^- \rightarrow u \bar{u} u \bar{u}$ (or the same process with any other quark). Table 25.2 sums up all possible singular regions for this problem.

Thus, during the preparation of a NLO-calculation, the possible singular regions have to be identified. `fks_regions.f90` deals with this issue.

        procedure :: valid_pair => flv_structure_valid_pair
        procedure :: create_uborn => flv_structure_create_uborn
    end type flv_structure_t

```

Returns `true` if the two particles at position `i` and `j` in the flavor array can originate from the same splitting. For this purpose, the function first checks whether the splitting is allowed at all. If this is the case, the emitter is removed from the flavor array. If the resulting array is equivalent to the Born flavor structure `flv_born`, the pair is accepted as a valid splitting.

```

<fks regions: procedures>+≡
    function flv_structure_valid_pair &
        (flv_real,i,j, flv_born, model) result (valid)
        class(flv_structure_t), intent(in) :: flv_real
        integer, intent(in) :: i,j
        type(flv_structure_t), intent(in) :: flv_born
        class(model_data_t), intent(in) :: model
        logical :: valid
        integer :: k, n_orig
        type(flv_structure_t) :: flv_test
        integer, dimension(:), allocatable :: flv_orig, flv_orig2
        valid = .false.

```

First check whether the splitting is possible. The array `flv_orig` contains all particles which share a vertex with the particles at position `i` and `j`. If its size is equal to zero, no splitting is possible and the subroutine is exited.

```

<fks regions: procedures>+≡
    call model%match_vertex &

```

```

        (flv_real%flst(i), flv_real%flst(j), flv_orig)
n_orig = size (flv_orig)
if (n_orig == 0) then
    return
else

```

For a quark emitting a gluon, `flv_orig` contains the PDG code of the anti-quark. To be on the safe side, a second array is created, which contains both the positively and negatively signed PDG codes. Then, the original tuple (i, j) is removed from the real flavor structure and the particles in `flv_orig2` are inserted. If the resulting Born configuration is equal to the underlying Born configuration, up to a permutation of final-state particles, the tuple (i, j) is accepted as valid.

```

(fks regions: procedures)+≡
    allocate (flv_orig2 (2*n_orig))

This subroutine starts with a specification of N - and $N + 1$ -particle configurations, `flst_born` and `flst_real`, saved in `reg_data`. From these, it creates a list of fundamental tuples, a list of emitters and a list containing the $N + 1$ -particle configuration, rearranged in such a way that the emitter-radiation pair is last (`flst_alr`). For the $e^+ e^- \rightarrow u \bar{u} g$ - example, the generated objects are shown in table 25.2. Note that at this point, `flst_alr` is arranged in such a way that the emitter can only be equal to $n_{legs} - 1$ for final-state radiation or 0, 1, or 2 for initial-state radiation. Further, it occurs that regions can be equivalent. For example in table 25.2 the regions corresponding to `alr = 1` and `alr = 3` as well as `alr = 2` and `alr = 4` describe the same physics and are therefore equivalent.

The fks phase space type contains the wood phase space and separately the in- and outgoing momenta for the real process and the corresponding Born momenta. Additionally, there are the variables ξ, ξ_{max}, y and ϕ which are used to create the real phase space, as well as the jacobian and its corresponding soft and collinear limit. Lastly, the array `ch_to_em` connects each channel with an emitter.

25.3.1 Creation of the real phase space - FSR

At this point, the Born phase space has been generated, as well as the three random variables ξ , y and ϕ . The question is how the real phase space is generated for a final-state emission configuration. We work with two different sets of momenta, the Born configuration $\{\bar{k}_\oplus, \bar{k}_\ominus, \bar{k}_1, \dots, \bar{k}_n\}$ and the real configuration $\{k_\oplus, k_\ominus, k_1, \dots, k_n, k_{n+1}\}$. We define the momentum of the emitter to be on the n -th position and the momentum of the radiated particle to be at position $n+1$. The magnitude of the spatial component of k is denoted by \underline{k} .

For final-state emissions, it is $\bar{k}_\oplus = k_\oplus$ and $\bar{k}_\ominus = k_\ominus$. Thus, the center-of-mass systems coincide and it is

$$q = \sum_{i=1}^n \bar{k}_i = \sum_{i=1}^{n+1} k_i, \quad (25.2)$$

with $\vec{q} = 0$ and $q^2 = (q^0)^2$.

We want to construct the real phase space from the Born phase space using three random numbers. They are defined as follows:

- $\xi = \frac{2k_{n+1}^0}{\sqrt{s}} \in [0, \xi_{max}]$, where k_{n+1} denotes the four-momentum of the radiated particle.
- $y = \cos \theta = \frac{\vec{k}_n \cdot \vec{k}_{n+1}}{k_n k_{n+1}}$ is the splitting angle.
- The angle between the two splitting particles in the transversal plane, $\phi \in [0, 2\pi]$.

Further, $k_{rec} = \sum_{i=1}^{n-1} k_i$ denotes the sum of all recoiling momenta.

```

<phs fks: compute momentum of radiated particle>
<phs fks: construct the recoiling momenta>
<phs fks: Jacobian>
end subroutine fks_born_to_real_fsr

```

The momentum of the radiated particle is computed according to

$$\underline{k}_n = \frac{q^2 - M_{\text{rec}}^2 - 2q^0 \underline{k}_{n+1}}{2(q^0 - \underline{k}_{n+1}(1-y))}, \quad (25.3)$$

with $k = k_n + k_{n+1}$ and $M_{\text{rec}}^2 = k_{\text{rec}}^2 = (q - k)^2$. Because of $\bar{\mathbf{k}}_n \parallel \mathbf{k}_n + \mathbf{k}_{n+1}$ we find $M_{\text{rec}}^2 = (q - \bar{\mathbf{k}}_n)^2$. Equation ?? follows from the fact that $(\mathbf{k} - \mathbf{k}_n)^2 = \mathbf{k}_{n+1}^2$, which is equivalent to $\mathbf{k}_n \cdot \mathbf{k} = \frac{1}{2}(\mathbf{k}_n^2 + \mathbf{k}^2 - \mathbf{k}_{n+1}^2)$. \mathbf{k}_n and \mathbf{k}_{n+1} are obtained by first setting up vectors parallel to $\bar{\mathbf{k}}_n$,

$$\mathbf{k}'_n = \underline{k}_n \frac{\bar{\mathbf{k}}_n}{\underline{k}_n}, \quad \mathbf{k}'_{n+1} = \underline{k}_{n+1} \frac{\bar{\mathbf{k}}_n}{\underline{k}_n},$$

and then rotating these vectors by an amount of $\cos \psi_n = \frac{\mathbf{k}_n \cdot \mathbf{k}}{\underline{k}_n \underline{k}}$.

```

<phs fks: compute momentum of radiated particle>≡

```

Construction of the recoiling momenta. The reshuffling of momenta must not change the invariant mass of the recoiling system, which means $k_{\text{rec}}^2 = k_{\text{rec}}^{-2}$. Therefore, the momenta are related by a boost, $\bar{k}_i = \Lambda k_i$. The boost parameter is

$$\beta = \frac{q^2 - (k_{\text{rec}}^0 + \underline{k}_{\text{rec}})^2}{q^2 + (k_{\text{rec}}^0 + \underline{k}_{\text{rec}})^2}$$

```

<phs fks: construct the recoiling momenta>≡
  k_rec0 = q0 - vector4_get_component (p_real(emitter), 0) - &
    vector4_get_component (p_real(nlegreal), 0)
  uk_rec = sqrt (k_rec0**2 - mrec2)
  beta = (q2 - (k_rec0 + uk_rec)**2) / (q2 + (k_rec0 + uk_rec)**2)
  k = space_part (p_real(emitter) + p_real(nlegreal))
  do i = 1, 3
    call vector3_set_component (vec, i, 1 / uk*vector3_get_component(k,i))
  end do
  lambda = boost (beta/sqrt(1-beta**2), vec)
  do i = 3, nlegborn
    if (i /= emitter) then
      p_real(i) = lambda * p_born(i)
    end if
  end do
  do i = 1, 3

    call vector3_set_component (vec, i, pb/uk_n_born)
  end do
  rot = rotation (cos(phi), sin(phi), vec)
  p_real(nlegreal) = rot * p_real(nlegreal)
  p_real(emitter) = rot * p_real(emitter)
  k2 = 2*uk_n*uk_np1*(1-y)

```

The factor $\frac{q^2}{(4\pi)^3}$ is not included here since it is supplied during phase space generation. Also, we already divide by ξ .

```

<phs fks: Jacobian>≡
  if (present (jac)) then
    jac(1) = 1.0*uk_n**2/uk_n_born / (uk_n - k2/(2*q0))
    !!! Soft jacobian
    jac(2) = 1.0
    !!! Collinear jacobian
    jac(3) = 1.0*(1-xi/2*q0/uk_n_born)
  end if

```

The emitted particle cannot have more momentum than the emitter has in the Born phase space. Thus, there is an upper bound for ξ , determined by the condition $k_{n+1}^0 = \bar{k}_n$, which is equal to

$$\xi_{\text{max}} = \frac{2}{\bar{k}_n} q^0.$$

25.4.1 The real contribution to the cross section

In each singular region α , the real contribution to σ is given by the second summand of eqn. ??,

$$\sigma_{\text{real}}^{\alpha} = \int d\Phi_n \int_0^{2\pi} d\phi \int_{-1}^1 dy \int_0^{\xi_{\text{max}}} d\xi \left(\frac{1}{\xi} \right)_+ \left(\frac{1}{1-y} \right)_+ \underbrace{\frac{J(\Phi_n, \xi, y, \phi)}{\xi} [(1-y)\xi^2 \mathcal{R}^{\alpha}(\Phi_{n+1})]}_{g^{\alpha}(\xi, y)} \quad (25.4)$$

Writing out the plus-distribution and introducing $\tilde{\xi} = \xi/\xi_{\text{max}}$ to set the upper integration limit to 1, this turns out to be equal to

$$\sigma_{\text{real}}^{\alpha} = \int d\Phi_n \int_0^{2/\pi} d\phi \int_{-1}^1 \frac{dy}{1-y} \left\{ \int_0^1 d\tilde{\xi} \left[\frac{g^{\alpha}(\tilde{\xi}\xi_{\text{max}}, y)}{\tilde{\xi}} - \underbrace{\frac{g^{\alpha}(0, y)}{\tilde{\xi}}}_{\text{soft}} - \underbrace{\frac{g^{\alpha}(\tilde{\xi}\xi_{\text{max}}, 1)}{\tilde{\xi}}}_{\text{coll.}} + \underbrace{\frac{g^{\alpha}(0, 1)}{\tilde{\xi}}}_{\text{coll.+soft}} \right] \right. \\ \left. + [\log \xi_{\text{max}}(y) g^{\alpha}(0, y) - \log \xi_{\text{max}}(1) g^{\alpha}(0, 1)] \right\}. \quad (25.5)$$

This formula is implemented in the `nlo_data`-type.

Chapter 26

Multi-Channel Integration

In this chapter we provide the implementations of the MCI abstract type: handling multi-channel phase space and concrete implementations.

Module `mci_midpoint`: A simple integrator that uses the midpoint rule to sample the integrand uniformly over the unit hypercube. There is only one integration channel, so this can be matched only to single-channel phase space.

Module `mci_vamp`: Interface for the VAMP package.

26.1 Simple midpoint integration

This is a most simple implementation of an integrator. The algorithm is the straightforward multi-dimensional midpoint rule, i.e., the integration hypercube is binned uniformly, the integrand is evaluated at the midpoints of each bin, and the result is the average. The binning is equivalent for all integration dimensions.

This rule is accurate to the order h^2 , where h is the bin width. Given that $h = N^{-1/d}$, where d is the integration dimension and N is the total number of sampling points, we get a relative error of order $N^{-2/d}$. This is superior to MC integration if $d < 4$, and equivalent if $d = 4$. It is not worse than higher-order formulas (such as Gauss integration) if the integrand is not smooth, e.g., if it contains cuts.

The integrator is specifically single-channel. However, we do not limit the dimension.

    <MCI midpoint: procedures>

    <MCI midpoint: tests>

end module mci_midpoint

```

26.1.1 Integrator

The object contains the methods for integration and event generation. For the actual work and data storage, it spawns an instance object.

After an integration pass, we update the `max` parameter to indicate the maximum absolute value of the integrand that the integrator encountered. This is required for event generation.

```

```

Integrate. The number of dimensions is arbitrary. We make sure that the number of calls is evenly distributed among the dimensions. The actual number of calls will typically be smaller than the requested number, but never smaller than 1.

The sampling over a variable number of dimensions implies a variable number of nested loops. We implement this by a recursive subroutine, one loop in each recursion level.

The number of iterations `n_it` is ignored. Also, the error is set to zero in the current implementation.

With this integrator, we allow the calculation to abort immediately when forced by a signal. There is no state that we can save, hence we do not catch an interrupt.

Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

This is the function $f(x) = 3x^2$ with integral $\int_0^1 f(x) dx = 1$ and maximum $f(1) = 3$. If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

Mimicking the behavior of a process object, we store the argument and result inside the sampler, so we can `fetch` results.

```

<MCI midpoint: test types>≡
  type, extends (mci_sampler_t) :: test_sampler_1_t
    real(default), dimension(:), allocatable :: x
    real(default) :: val
  contains
    <MCI midpoint: test sampler 1: TBP>
  end type test_sampler_1_t

```

Output: There is nothing stored inside, so just print an informative line.

```

<MCI midpoint: test sampler 1: TBP>≡

26.2 VAMP interface

The standard method for integration is **VAMP**: the multi-channel version of the VEGAS algorithm. Each parameterization (channel) of the hypercube is binned in each dimension. The binning is equally equidistant, but an iteration of the integration procedure, the binning is updated for each dimension, according to the variance distribution of the integrand, summed over all other dimension. In the next iteration, the binning approximates (hopefully) follows the integrand more closely, and the accuracy of the result is increased. Furthermore, the

relative weight of the individual channels is also updated after an iteration.

The bin distribution is denoted as the grid for a channel, which we can write to file and reuse later.

In our implementation we specify the generic VAMP algorithm more tightly: the number of bins is equal for all dimensions, the initial weights are all equal. The user controls whether to update bins and/or weights after each iteration. The integration is organized in passes, each one consisting of several iterations with a common number of calls to the integrand. The first passes are intended as warmup, so the results are displayed but otherwise discarded. In the final pass, the integration estimates for the individual iterations are averaged for the final result.

```

Integrate. Perform a new integration pass (possibly reusing previous results), which may consist of several iterations.

Note: we record the integral once per iteration. The integral stored in the `mci` record itself is the last integral of the current iteration, no averaging done. The `results` record may average results.

Note: recording the efficiency is not supported yet.

26.2.5 Sampler as Workspace

In the full setup, the sampling function requires the process instance object as workspace. We implement this by (i) implementing the process instance as a type extension of the abstract `sampler_t` object used by the MCI implementation and (ii) providing such an object as an extra argument to the sampling function that VAMP can call. To minimize cross-package dependencies, we use an abstract type `vamp_workspace` that VAMP declares and extend this by including a pointer to the `sampler` and `instance` objects. In the body of the sampling function, we dereference this pointer and can then work with the contents.

```

Prepare a new integration pass: write the pass-specific settings to the `instance` object. This should be called initially, together with the `create_grids` procedure, and whenever we start a new integration pass.

Set `reshape` if the number of calls is different than previously (unless it was zero, indicating the first pass).

We link VAMP histories to the allocated histories in the current pass object, so the recorded results are persistent. However, if there are no histories present there, we allocate them locally. In that case, the histories will disappear together with the MCI instance object.

Reset a grid set, so we can start a fresh integration pass. In effect, we delete results of previous integrations, but keep the grid shapes, weights, and variance arrays, so adaptation is still possible. The grids are prepared for a specific number of calls (per iteration) and sampling mode (stratified/importance).

The `vamp_discard_integrals` implementation will reshape the grids only if the argument `num_calls` is present.

Integration: sample the VAMP grids. The number of calls etc. are already stored inside the grids. We provide the random-number generator, the sampling function, and a link to the workspace object, which happens to contain a pointer to the sampler object. The sampler object thus becomes the workspace of the sampling function.

Note: in the current implementation, the random-number generator must

be the TAO generator. This explicit dependence should be removed from the VAMP implementation.

```

26.2.7 Sampling function

The VAMP sampling function has a well-defined interface which we have to implement. The **data** argument allows us to pass pointers to the **sampler** and **instance** objects, so we can access configuration data and fill point-dependent contents within these objects.

The **weights** and **channel** argument must be present in the call.

Note: we would normally declare the **instance** pointer with the concrete type, or just use the **data** component directly. Unfortunately, gfortran 4.6 forgets the inherited base-type methods in that case.

Note: this is the place where we must look for external signals, i.e., interrupt from the OS. We would like to raise a VAMP exception which is then caught by **vamp_sample_grids** as the caller, so it dumps its current state and returns (with the signal still pending). WHIZARD will then terminate gracefully. Of course, VAMP should be able to resume from the dump.

In the current implementation, we handle the exception in place and terminate immediately. The incomplete current integration pass is lost.

```

<MCI vamp: procedures>+≡
    function vamp_sampling_function &
        (xi, data, weights, channel, grids) result (f)
    real(default) :: f
    real(default), dimension(:), intent(in) :: xi
    class(vamp_data_t), intent(in) :: data
    real(default), dimension(:), intent(in), optional :: weights
    integer, intent(in), optional :: channel
    type(vamp_grid), dimension(:), intent(in), optional :: grids
    type(exception) :: exc

```

```

class(mci_instance_t), pointer :: instance
logical :: verbose
character(*), parameter :: FN = "WHIZARD sampling function"
select type (data)
type is (mci_workspace_t)
    instance => data%instance
    select type (instance)
    class is (mci_vamp_instance_t)
        instance%calls = instance%calls + 1
        verbose = instance%mci%verbose
    end select
    call instance%evaluate (data%sampler, channel, xi)
    if (signal_is_pending ()) then
        call raise_exception (exc, EXC_FATAL, FN, "signal received")
        call handle_vamp_exception (exc, verbose)
        call terminate_now_if_signal ()
    end if
    f = instance%get_value ()
end select
end function vamp_sampling_function

```

This is supposed to be the mapping between integration channels. The VAMP event generating procedures technically require it, but it is meaningless in our setup where all transformations happen inside the sampler object. So, this implementation is trivial:

```

⟨MCI vamp: procedures⟩+≡
pure function phi_trivial (xi, channel_dummy) result (x)
    real(default), dimension(:), intent(in) :: xi
    integer, intent(in) :: channel_dummy
    real(default), dimension(size(xi)) :: x
    x = xi
end function phi_trivial

```

26.2.8 Integrator instance: evaluation

Here, we compute the multi-channel reweighting factor for the current channel, that accounts for the Jacobians of the transformations from/to all other channels.

The computation of the VAMP probabilities may consume considerable time, therefore we enable parallel evaluation. (Collecting the contributions to `mci%g` is a reduction, which we should also implement via OpenMP.)

```

⟨MCI vamp: mci vamp instance: TBP⟩+≡
    procedure :: compute_weight => mci_vamp_instance_compute_weight

⟨MCI vamp: procedures⟩+≡
subroutine mci_vamp_instance_compute_weight (mci, c)
    class(mci_vamp_instance_t), intent(inout) :: mci
    integer, intent(in) :: c
    integer :: i
    mci%selected_channel = c
    !$OMP PARALLEL PRIVATE(i) SHARED(mci)
    !$OMP DO

```

```

do i = 1, mci%nci%n_channel
  if (mci%w(i) /= 0) then
    mci%gi(i) = vamp_probability (mci%grids%grids(i), mci%x(:,i))
  else
    mci%gi(i) = 0
  end if
end do
!$OMP END DO
!$OMP END PARALLEL
mci%g = 0
if (mci%gi(c) /= 0) then
  do i = 1, mci%nci%n_channel
    if (mci%w(i) /= 0 .and. mci%f(i) /= 0) then
      mci%g = mci%g + mci%w(i) * mci%gi(i) / mci%f(i)
    end if
  end do
end if
if (mci%g /= 0) then
  mci%nci_weight = mci%gi(c) / mci%g
else
  mci%nci_weight = 0
end if
end subroutine mci_vamp_instance_compute_weight

```

Record the integrand.

```

<MCI vamp: mci vamp instance: TBP>+≡
  procedure :: record_integrand => mci_vamp_instance_record_integrand

<MCI vamp: procedures>+≡
  subroutine mci_vamp_instance_record_integrand (mci, integrand)
    class(mci_vamp_instance_t), intent(inout) :: mci
    real(default), intent(in) :: integrand
    mci%integrand = integrand
  end subroutine mci_vamp_instance_record_integrand

```

Get the event weight. The default routine returns the same value that we would use for integration. This is correct if we select the integration channel according to the channel weight. `vamp_next_event` does differently, so we should rather rely on the weight that VAMP returns. This is the value stored in `vamp_weight`. We override the default TBP accordingly.

```

<MCI vamp: mci vamp instance: TBP>+≡
  procedure :: get_event_weight => mci_vamp_instance_get_event_weight
  procedure :: get_event_excess => mci_vamp_instance_get_event_excess

<MCI vamp: procedures>+≡

    value = mci%vamp_excess
  else
    call msg_bug ("VAMP: attempt to read undefined event excess weight")
  end if
end function mci_vamp_instance_get_event_excess

```

26.2.9 VAMP exceptions

A VAMP routine may have raised an exception. Turn this into a WHIZARD error message.

An external signal could raise a fatal exception, but this should be delayed and handled by the correct termination routine.

(MCI vamp: procedures)+≡

```

subroutine handle_vamp_exception (exc, verbose)
  type(exception), intent(in) :: exc
  logical, intent(in) :: verbose
  integer :: exc_level
  if (verbose) then
    exc_level = EXC_INFO
  else
    exc_level = EXC_ERROR
  end if
  if (exc%level >= exc_level) then
    write (msg_buffer, "(A,':',1x,A)") trim (exc%origin), trim (exc%message)
    select case (exc%level)
      case (EXC_INFO); call msg_message ()
      case (EXC_WARN); call msg_warning ()
      case (EXC_ERROR); call msg_error ()
      case (EXC_FATAL)
        if (signal_is_pending ()) then
          call msg_message ()
        else
          call msg_fatal ()
        end if
      end select
    end if
  end if
end subroutine handle_vamp_exception

```

26.2.10 Unit tests

(MCI vamp: public)+≡

```

public :: mci_vamp_test

```

```

<MCI vamp: tests>+≡
  subroutine mci_vamp_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <MCI vamp: execute tests>
  end subroutine mci_vamp_test

```

Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

In mode 1, the function is $f(x) = 3x^2$ with integral $\int_0^1 f(x) dx = 1$ and maximum $f(1) = 3$. If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

In mode 2, the function is $11x^{10}$, also with integral 1.

```

<MCI vamp: test types>≡
  type, extends (mci_sampler_t) :: test_sampler_1_t
    real(default), dimension(:), allocatable :: x
    real(default) :: val
    integer :: mode = 1
  contains
    <MCI vamp: test sampler 1: TBP>
  end type test_sampler_1_t

```

Output: There is nothing stored inside, so just print an informative line.

```

<MCI vamp: test sampler 1: TBP>≡
  procedure :: write => test_sampler_1_write

<MCI vamp: tests>+≡
  subroutine test_sampler_1_write (object, unit, testflag)
    class(test_sampler_1_t), intent(in) :: object

    f = 1
  end subroutine test_sampler_1_fetch

```

Two-channel, two dimension test sampler

This sampler implements the function

$$f(x, y) = 4 \sin^2(\pi x) \sin^2(\pi y) + 2 \sin^2(\pi v) \quad (26.1)$$

where

$$x = u^v \quad u = xy \quad (26.2)$$

$$y = u^{(1-v)} \quad v = \frac{1}{2} \left(1 + \frac{\log(x/y)}{\log xy} \right) \quad (26.3)$$

Each term contributes 1 to the integral. The first term in the function is peaked along a cross aligned to the coordinates x and y , while the second term is peaked along the diagonal $x = y$.

The Jacobian is

$$\frac{\partial(x, y)}{\partial(u, v)} = |\log u| \quad (26.4)$$

```

        f = sampler%f
    end subroutine test_sampler_3_fetch

```

One-dimensional integration

Construct an integrator and use it for a one-dimensional sampler.

Note: We would like to check the precise contents of the grid allocated during integration, but the output format for reals is very long (for good reasons), so the last digits in the grid content display are numerical noise. So, we just check the integration results.

```

Chapter 27

Process Libraries

This chapter consists of two modules which organize and interface the interaction matrix elements for a variety of elementary processes.

prclib_interfaces This module deals with matrix-element code which is accessible via external libraries (Fortran libraries or generic C-compatible libraries) and must either be generated by the program or provided by the user explicitly.

The module defines and uses an abstract type `prc_writer_t` and two abstract extensions, one for a Fortran module and one for a C-compatible library. The implementation provides the specific methods for writing the appropriate parts in external matrix element code.

prc_core_def This module defines the abstract types `prc_core_def_t` and `prc_driver_t`. The implementation of the former provides the configuration for processes of a certain class, while the latter accesses the corresponding matrix element, in particular those generated by the appropriate `prc_writer_t` object.

process_libraries This module combines the functionality of the previous module with the means for holding processes definitions (the internal counterpart of appropriate declarations in the user interface), for handling matrix elements which do not need external code, and for accessing the matrix elements by the procedures for matrix-element evaluation, integration and event generation.

test_me This module provides a test implementation for the abstract types in the `prc_core_def` module. The implementation is intended for self-tests of several later modules. The implementation is internal, i.e., no external code has is generated.

Chapter 28

Integration and Process Objects

This is the central part of the WHIZARD package. It provides the functionality for evaluating structure functions, kinematics and matrix elements, integration and event generation. It combines the various parts that deal with those tasks individually and organizes the data transfer between them.

prc_core Here, we define the abstract `prc_core_t` type which handles all specific features of kinematics matrix-element evaluation that depend on a particular class of processes.

parton_states A `parton_state_t` object represents an elementary partonic interaction. There are two versions: one for the isolated elementary process, one for the elementary process convoluted with the structure-function chain. The parton state is an effective state. It needs not coincide with the seed-kinematics state which is used in evaluating phase space.

processes Here, all pieces are combined for the purpose of evaluating the elementary processes. The whole algorithm is coded in terms of abstract data types as defined in the appropriate modules: `prc_core` for matrix-element evaluation, `prc_core_def` for the associated configuration and driver, `sf_base` for beams and structure-functions, `phs_base` for phase space, and `mci_base` for integration and event generation.

process_stacks Process stacks collect process objects.

28.1 Abstract process core

In this module we provide abstract data types for process classes. Each process class represents a set of processes which are handled by a common “method”, e.g., by the O’MEGA matrix-element generator. The process class is also able to select a particular implementation for the phase-space and integration modules.

For a complete implementation of a process class, we have to provide extensions of the following abstract types:

prc_core_def_t process and matrix-element configuration

prc_writer_t (optional) writing external matrix-element code

prc_driver_t accessing the matrix element (internal or external)

prc_core_t evaluating kinematics and matrix element. The process core also selects phase-space and integrator implementations as appropriate for the process class and configuration.

In the actual process-handling data structures, each process component contains an instance of such a process class as its core. This allows us to keep the **processes** module below, which supervises matrix-element evaluation, integration, and event generation, free of any reference to concrete implementations (for the process class, phase space, and integrator).

There are no unit tests, these are deferred to the **processes** module.

```
<prc_core.f90>≡
  <File header>
  module prc_core

    <Use kinds>
    <Use strings>
    use io_units
    use diagnostics
    use lorentz
    use interactions

    use sf_base
    use process_constants
    use mci_base

    use prc_core_def
    use process_libraries

    <Standard module head>

    <Prc core: public>

    <Prc core: types>

    <Prc core: interfaces>

    contains

    <Prc core: procedures>

  end module prc_core
```

28.1.1 The process core

The process core is of abstract data type. Different types of matrix element will be represented by different implementations.

```
<Prc core: public>≡
  public :: prc_core_t
```

```

<Prc core: types>≡
  type, abstract :: prc_core_t
    class(prc_core_def_t), pointer :: def => null ()
    logical :: data_known = .false.
    type(process_constants_t) :: data
    class(prc_core_driver_t), allocatable :: driver
    logical :: use_color_factors = .false.
    integer :: nc = 3
  contains
    <Prc core: process core: TBP>
  end type prc_core_t

```

In any case there must be an output routine.

```

<Prc core: process core: TBP>≡
  procedure(prc_core_write), deferred :: write

<Prc core: interfaces>≡
  abstract interface
    subroutine prc_core_write (object, unit)
      import
      class(prc_core_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine prc_core_write
  end interface

```

For initialization, we assign a pointer to the process entry in the relevant library. This allows us to access all process functions via the implementation of `prc_core_t`.

We declare the `object` as `intent(inout)`, since just after allocation it may be useful to store some extra data in the object, which we can then use in the actual initialization. This applies to extensions of `prc_core` which override the `init` method.

```

<Prc core: process core: TBP>+≡
  procedure :: init => prc_core_init
  procedure :: base_init => prc_core_init

<Prc core: procedures>≡
  subroutine prc_core_init (object, def, lib, id, i_component)
    class(prc_core_t), intent(inout) :: object
    class(prc_core_def_t), intent(in), target :: def
    type(process_library_t), intent(in), target :: lib
    type(string_t), intent(in) :: id
    integer, intent(in) :: i_component
    object%def => def
    call lib%connect_process (id, i_component, object%data, object%driver)
    object%data_known = .true.
  end subroutine prc_core_init

```

Return true if the matrix element generation was successful. This can be tested by looking at the number of generated flavor states, which should be nonzero.

```

<Prc core: process core: TBP>+≡
  procedure :: has_matrix_element => prc_core_has_matrix_element

```

```

<Prc core: procedures>+≡
  function prc_core_has_matrix_element (object) result (flag)
    class(prc_core_t), intent(in) :: object
    logical :: flag
    flag = object%data%n_flg /= 0
  end function prc_core_has_matrix_element

```

Return true if a MC dataset should be attached to this process component.
False if it shares the dataset with another component.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_get_flag), deferred :: needs_mcset

```

```

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_get_flag (object) result (flag)
      import
      class(prc_core_t), intent(in) :: object
      logical :: flag
    end function prc_core_get_flag
  end interface

```

Return an integer number

```

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_get_integer (object) result (i)
      import
      class(prc_core_t), intent(in) :: object
      integer :: i
    end function prc_core_get_integer
  end interface

```

Return the number of distinct terms requested by this process component.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_get_integer), deferred :: get_n_terms

```

Tell whether a particular combination of flavor/helicity/color state is allowed for the matrix element.

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_is_allowed), deferred :: is_allowed

<Prc core: interfaces>+≡
  abstract interface
    function prc_core_is_allowed (object, i_term, f, h, c) result (flag)
      import
      class(prc_core_t), intent(in) :: object
      integer, intent(in) :: i_term, f, h, c
      logical :: flag
    end function prc_core_is_allowed
  end interface

```

Set the constant process data for a specific term. By default, these are the constants stored inside the object, ignoring the term index. Type extensions may override this and provide term-specific data.

```

<Prc core: process core: TBP>+≡
  procedure :: get_constants => prc_core_get_constants

<Prc core: procedures>+≡
  subroutine prc_core_get_constants (object, data, i_term)
    class(prc_core_t), intent(in) :: object
    type(process_constants_t), intent(out) :: data
    integer, intent(in) :: i_term
    data = object%data
  end subroutine prc_core_get_constants

```

The strong coupling is not among the process constants. The default implementation is to return a negative number, which indicates that α_s is not available. This may be overridden by an implementation that provides an (event-specific) value. The value can be stored in the tmp workspace.

```

<Prc core: process core: TBP>+≡
  procedure :: get_alpha_s => prc_core_get_alpha_s

<Prc core: procedures>+≡
  function prc_core_get_alpha_s (object, tmp) result (alpha)
    class(prc_core_t), intent(in) :: object
    class(workspace_t), intent(in), allocatable :: tmp
    real(default) :: alpha
    alpha = -1
  end function prc_core_get_alpha_s

```

Allocate the workspace associated to a process component. The default is that there is no workspace, so we do nothing. A type extension may override this and allocate a workspace object of appropriate type, which can be used in further calculations.

In any case, the `intent(out)` attribute deletes any previously allocated workspace.

```

<Prc core: process core: TBP>+≡
  procedure :: allocate_workspace => prc_core_ignore_workspace

<Prc core: procedures>+≡
  subroutine prc_core_ignore_workspace (object, tmp)
    class(prc_core_t), intent(in) :: object
    class(workspace_t), intent(inout), allocatable :: tmp
  end subroutine prc_core_ignore_workspace

```

Initialize the structure-function instance that corresponds to a process component. In ordinary cases, this amounts to a straightforward copy of the given template, but the process core may also choose to modify the setup, and it may access its own workspace.

The `sf_chain_instance` is the object that we want to prepare. The `sf_chain` argument is a template for its structure. For the initialization, we also need the number of channels `n_channel`.

Note: crash with nagfor 5.3.1 if `sf_chain_instance` is declared `intent(out)`, as would be more appropriate.

```

<Prc core: process core: TBP>+≡
  procedure :: init_sf_chain => prc_core_init_sf_chain

<Prc core: procedures>+≡
  subroutine prc_core_init_sf_chain &
    (object, sf_chain_instance, sf_chain, n_channel, tmp)
    class(prc_core_t), intent(in) :: object
    type(sf_chain_instance_t), intent(inout), target :: sf_chain_instance
    type(sf_chain_t), intent(in), target :: sf_chain
    integer, intent(in) :: n_channel
    class(workspace_t), intent(inout), allocatable :: tmp
    call sf_chain_instance%init (sf_chain, n_channel)
  end subroutine prc_core_init_sf_chain

```

Compute the momenta in the hard interaction, taking the seed kinematics as input. The `i_term` index tells us which term we want to compute. (The standard method is to just transfer the momenta to the hard interaction.)

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_hard_kinematics), deferred :: &
    compute_hard_kinematics

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_compute_hard_kinematics &
      (object, p_seed, i_term, int_hard, tmp)
    import
    class(prc_core_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(in) :: p_seed
    integer, intent(in) :: i_term
    type(interaction_t), intent(inout) :: int_hard
    class(workspace_t), intent(inout), allocatable :: tmp
  end subroutine prc_core_compute_hard_kinematics
  end interface

```

Compute the momenta in the effective interaction, taking the hard kinematics as input. (This is called only if parton recombination is to be applied for the process variant.)

```

<Prc core: process core: TBP>+≡
  procedure(prc_core_compute_eff_kinematics), deferred :: &
    compute_eff_kinematics

<Prc core: interfaces>+≡
  abstract interface
    subroutine prc_core_compute_eff_kinematics &
      (object, i_term, int_hard, int_eff, tmp)
    import
    class(prc_core_t), intent(in) :: object
    integer, intent(in) :: i_term
    type(interaction_t), intent(in) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(workspace_t), intent(inout), allocatable :: tmp
  end subroutine prc_core_compute_eff_kinematics

```

```
end interface
```

Recover the missing pieces. We know the incoming momenta of the `p_seed` array and the outgoing momenta of the `int_eff` interaction. We have to recover the outgoing momenta of `p_seed` and the incoming momenta of `int_eff`.

(The trivial case is that these are identical.)

Furthermore, if `int_hard` and `int_eff` are not aliased, we have to set the momenta there. In the trivial case, `int_eff` is a pointer to `int_hard`, so `int_hard` should not be touched at all.

```
<Prc core: process core: TBP>+=
  procedure(prc_core_recover_kinematics), deferred :: &
    recover_kinematics

<Prc core: interfaces>+=
  abstract interface
    subroutine prc_core_recover_kinematics &
      (object, p_seed, int_hard, int_eff, tmp)
    import
    class(prc_core_t), intent(in) :: object
    type(vector4_t), dimension(:), intent(inout) :: p_seed
    type(interaction_t), intent(inout) :: int_hard
    type(interaction_t), intent(inout) :: int_eff
    class(workspace_t), intent(inout), allocatable :: tmp
  end subroutine prc_core_recover_kinematics
end interface
```

The process core must implement this function. Here, `j` is the index of the particular term we want to compute. The amplitude may depend on the factorization and renormalization scales.

The `tmp` (workspace) argument may be used if it is provided by the caller. Otherwise, the routine should compute the result directly.

```
<Prc core: process core: TBP>+=
  procedure(prc_core_compute_amplitude), deferred :: compute_amplitude

<Prc core: interfaces>+=
  abstract interface
    function prc_core_compute_amplitude &
      (object, j, p, f, h, c, fac_scale, ren_scale, tmp) result (amp)
    import
    class(prc_core_t), intent(in) :: object
    integer, intent(in) :: j
    type(vector4_t), dimension(:), intent(in) :: p
    integer, intent(in) :: f, h, c
    real(default), intent(in) :: fac_scale, ren_scale
    class(workspace_t), intent(inout), allocatable, optional :: tmp
    complex(default) :: amp
  end function prc_core_compute_amplitude
end interface
```

28.1.2 Storage for intermediate results

The abstract `workspace_t` type allows process cores to set up temporary workspace. The object is an extra argument for each of the individual calculations between kinematics setup and matrix-element evaluation.

```
<Prc core: public>+≡
    public :: workspace_t

<Prc core: types>+≡
    type, abstract :: workspace_t
    contains
        procedure(workspace_write), deferred :: write
        procedure(workspace_reset_new_kinematics), deferred :: reset_new_kinematics
    end type workspace_t
```

For debugging, we should at least have an output routine.

```
<Prc core: interfaces>+≡
    abstract interface
        subroutine workspace_write (object, unit)
            import
            class(workspace_t), intent(in) :: object
            integer, intent(in), optional :: unit
        end subroutine workspace_write
    end interface
```

This is used during the NLO calculation, see there for more information.

```
<Prc core: interfaces>+≡
    abstract interface
        subroutine workspace_reset_new_kinematics (object)
            import
            class(workspace_t), intent(inout) :: object
        end subroutine workspace_reset_new_kinematics
    end interface
```

28.1.3 Helicity selection data

This is intended for use with O'MEGA, but may also be made available to other process methods. We set thresholds for counting the times a specific helicity amplitude is zero. When the threshold is reached, we skip this amplitude in subsequent calls.

For initializing the helicity counters, we need an object that holds the two parameters, the threshold (large real number) and the cutoff (integer).

A helicity value suppressed by more than `threshold` (a value which multiplies `epsilon`, to be compared with the average of the current amplitude, default is 10^{10}) is treated as zero. A matrix element is assumed to be zero and not called again if it has been zero `cutoff` times.

```
<Prc core: public>+≡
    public :: helicity_selection_t
```

```

<Prc core: types>+≡
  type :: helicity_selection_t
    logical :: active = .false.
    real(default) :: threshold = 0
    integer :: cutoff = 0
  contains
    <Prc core: helicity selection: TBP>
  end type helicity_selection_t

```

Output. If the selection is inactive, print nothing.

```

<Prc core: helicity selection: TBP>≡
  procedure :: write => helicity_selection_write

<Prc core: procedures>+≡
  subroutine helicity_selection_write (object, unit)
    class(helicity_selection_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    if (object%active) then
      write (u, "(3x,A)") "Helicity selection data:"

```

28.2 Process observables

We define an abstract `subevt_expr_t` object as an extension of the `subevt_t` type. The object contains a local variable list, variable instances (as targets for pointers in the variable list), and evaluation trees. The evaluation trees reference both the variables and the `subevt`.

There are two instances of the abstract type: one for process instances, one for physical events. Both have a common logical expression `selection` which determines whether the object passes user-defined cuts.

The intention is that we fill the `subevt_t` base object and compute the variables once we have evaluated a kinematical phase space point (or a complete event). We then evaluate the expressions and can use the results in further calculations.

The `process_expr_t` extension contains furthermore scale and weight expressions. The `event_expr_t` extension contains a reweighting-factor expression and a logical expression for event analysis. In practice, we will link the variable list of the `event_obs` object to the variable list of the currently active `process_obs` object, such that the process variables are available to both objects. Event variables are meaningful only for physical events.

Note that there are unit tests, but they are deferred to the `expr_tests` module.

    end if
  end subroutine subevt_expr_final

```

28.2.2 Initialization

Initialization: define local variables and establish pointers.

The common variables are `sqrts` (the nominal beam energy, fixed), `sqrts_hat` (the actual energy), `n_in`, `n_out`, and `n_tot` for the `subevt`. With the exception of `sqrts`, all are implemented as pointers to subobjects.

```

<Subevt expr: subevt expr: TBP>+≡
  procedure (subevt_expr_setup_vars), deferred :: setup_vars
  procedure :: base_setup_vars => subevt_expr_setup_vars

<Subevt expr: procedures>+≡
  subroutine subevt_expr_setup_vars (expr, sqrts)
    class(subevt_expr_t), intent(inout), target :: expr
    real(default), intent(in) :: sqrts
    call var_list_final (expr%var_list)
    call var_list_append_real (expr%var_list, &

```

```

        var_str ("sqrts"), sqrts, &
        locked = .true., verbose = .false., intrinsic = .true.)

        end if
    end subroutine parton_expr_setup_weight

```

Filling the partonic state consists of two parts. The first routine prepares the subevt without assigning momenta. It takes the particles from an `interaction_t`. It needs the indices and flavors for the beam, incoming, and outgoing particles.

We can assume that the particle content of the subevt does not change. Therefore, we set the event variables `n_in`, `n_out`, `n_tot` already in this initialization step.

```

28.2.5 Implementation for full events

This implementation contains the expressions that we can evaluate for the full event. It also contains data that pertain to the event, suitable for communication with external event formats. These data simultaneously serve as pointer targets for the variable lists hidden in the expressions (eval trees).

Squared matrix element and weight values: when reading events from file, the **ref** value is the number in the file, while the **prc** value is the number that we calculate from the momenta in the file, possibly with different parameters. When generating events the first time, or if we do not recalculate, the numbers should coincide. Furthermore, the array of **alt** values is copied from an array of alternative event records. These values should represent calculated values.

```

28.3 Parton states

A `parton_state_t` object contains the effective kinematics and dynamics of an elementary partonic interaction, with or without the beam/structure function state included. The type is abstract and has two distinct extensions. The `isolated_state_t` extension describes the isolated elementary interaction where the `int_eff` subobject contains the complex transition amplitude, exclusive in all quantum numbers. The particle content and kinematics describe the effective partonic state. The `connected_state_t` extension contains the partonic `subevt` and the expressions for cuts and scales which use it.

In the isolated state, the effective partonic interaction may either be identical to the hard interaction, in which case it is just a pointer to the latter. Or it may involve a rearrangement of partons, in which case we allocate it explicitly and flag this by `int_is_allocated`.

The `trace` evaluator contains the absolute square of the effective transition amplitude matrix, summed over final states. It is also summed over initial states, depending on the the beam setup allows. The result is used for integration.

The `matrix` evaluator is the counterpart of `trace` which is kept exclusive in all observable quantum numbers. The `flows` evaluator is furthermore exclusive in colors, but neglecting all color interference. The `matrix` and `flows` evaluators are filled only for sampling points that become part of physical events.

Note: It would be natural to make the evaluators allocatable. However, this causes memory corruption in gfortran 4.6.3. The extra `has_XXX` flags indicate whether evaluators are active, instead.

This module contains no unit tests. The tests are covered by the `processes` module below.

```

⟨parton_states.f90⟩≡
  ⟨File header⟩
  module parton_states

    ⟨Use kinds⟩
    ⟨Use strings⟩
    use io_units
    use format_utils, only: write_separator

    ⟨Parton states: procedures⟩

  end module parton_states

```

28.3.1 Abstract base type

The common part are the evaluators, one for the trace (summed over all quantum numbers), one for the transition matrix (summed only over unobservable quantum numbers), and one for the flow distribution (transition matrix without interferences, exclusive in color flow).

```

⟨Parton states: types⟩≡
  type, abstract :: parton_state_t
    logical :: has_trace = .false.
    logical :: has_matrix = .false.
    logical :: has_flows = .false.
    type(enumerator_t) :: trace

```

```

    type(evaluator_t) :: matrix
    type(evaluator_t) :: flows
contains
  ⟨Parton states: parton state: TBP⟩
end type parton_state_t

```

The `isolated_state_t` extension contains the `sf_chain_eff` object and the (hard) effective interaction `int_eff`, separately, both implemented as a pointer. The evaluators (trace, matrix, flows) apply to the hard interaction only.

If the effective interaction differs from the hard interaction, the pointer is allocated explicitly. Analogously for `sf_chain_eff`.

```

⟨Parton states: public⟩≡
  public :: isolated_state_t

⟨Parton states: types⟩+≡
  type, extends (parton_state_t) :: isolated_state_t
    logical :: sf_chain_is_allocated = .false.
    type(sf_chain_instance_t), pointer :: sf_chain_eff => null ()
    logical :: int_is_allocated = .false.
    type(interaction_t), pointer :: int_eff => null ()
contains
  ⟨Parton states: isolated state: TBP⟩
end type isolated_state_t

```

The `connected_state_t` extension contains all data that enable the evaluation of observables for the effective connected state. The evaluators connect the (effective) structure-function chain and hard interaction that were kept separate in the `isolated_state_t`.

The `flows_sf` evaluator is an extended copy of the structure-function

The `expr` subobject consists of the `subevt`, a simple event record, expressions for cuts etc. which refer to this record, and a `var_list` which contains event-specific variables, linked to the process variable list. Variables used within the expressions are looked up in `var_list`.

```

⟨Parton states: types⟩+≡
  public :: connected_state_t

⟨Parton states: types⟩+≡
  type, extends (parton_state_t) :: connected_state_t
    logical :: has_flows_sf = .false.
    type(evaluator_t) :: flows_sf
    logical :: has_expr = .false.
    type(parton_expr_t) :: expr
contains
  ⟨Parton states: connected state: TBP⟩
end type connected_state_t

```

Output: each evaluator is written only when it is active. The `sf_chain` is only written if it is explicitly allocated.

```

```

28.3.2 Common Initialization

Initialize the isolated parton state. In this version, the effective structure-function chain `sf_chain_eff` and the effective interaction `int_eff` both are trivial pointers to the seed structure-function chain and to the hard interaction, respectively.

```

<Parton states: isolated state: TBP>≡
    procedure :: init => isolated_state_init_pointers

```

```

(Parton states: procedures)+≡
subroutine isolated_state_init_pointers (state, sf_chain, int)
  class(isolated_state_t), intent(out) :: state
  type(sf_chain_instance_t), intent(in), target :: sf_chain
  type(interaction_t), intent(in), target :: int
  state%sf_chain_eff => sf_chain
  state%int_eff => int
end subroutine isolated_state_init_pointers

```

28.3.3 Evaluator initialization: isolated state

Create an evaluator for the trace of the squared transition matrix. The trace goes over all outgoing quantum numbers. Whether we trace over incoming quantum numbers other than color, depends on the given `qn_mask_in`.

There are two options: explicitly computing the color factor table (`use_cf` false; `nc` defined), or taking the color factor table from the hard matrix element data.

```

(Parton states: isolated state: TBP)+≡
  procedure :: setup_square_trace => isolated_state_setup_square_trace
(Parton states: procedures)+≡
subroutine isolated_state_setup_square_trace (state, core, qn_mask_in, &
  col)
  class(isolated_state_t), intent(inout), target :: state
  class(prc_core_t), intent(in) :: core
  type(quantum_numbers_mask_t), dimension(:), intent(in) :: qn_mask_in
  integer, dimension(:), intent(in) :: col
  type(quantum_numbers_mask_t), dimension(:), allocatable :: qn_mask
  associate (data => core%data)
    allocate (qn_mask (data%n_in + data%n_out))
    qn_mask(:data%n_in) = &
      new_quantum_numbers_mask (.false., .true., .false.) &
      .or. qn_mask_in
    qn_mask(data%n_in+1:) = &
      new_quantum_numbers_mask (.true., .true., .true.)
    if (core%use_color_factors) then
      call evaluator_init_square (state%trace, &
        state%int_eff, qn_mask, &
        data%cf_index, data%color_factors, col, nc=core%nc)
    else
      call evaluator_init_square (state%trace, &
        state%int_eff, qn_mask, nc=core%nc)
    end if
  end associate
  state%has_trace = .true.
end subroutine isolated_state_setup_square_trace

```

Setup the evaluator for the transition matrix, exclusive in helicities where this is requested.

For all unstable final-state particles we keep polarization according to the applicable decay options. If the process is a decay itself, this applies also to the initial state.

For all polarized final-state particles, we keep polarization including off-diagonal entries. We drop helicity completely for unpolarized final-state particles.

For the initial state, if the particle has not been handled yet, we apply the provided `qn_mask_in` which communicates the beam properties.

```

(Parton states: isolated state: TBP)+≡
  procedure :: setup_square_matrix => isolated_state_setup_square_matrix
(Parton states: procedures)+≡
  subroutine isolated_state_setup_square_matrix &
    (state, core, model, qn_mask_in, col)
    class(isolated_state_t), intent(inout), target :: state
    class(prc_core_t), intent(in) :: core
    class(model_data_t), intent(in), target :: model
    type(quantum_numbers_mask_t), dimension(:), intent(in) :: qn_mask_in
    integer, dimension(:), intent(in) :: col
    type(quantum_numbers_mask_t), dimension(:), allocatable :: qn_mask
    type(flavor_t), dimension(:), allocatable :: flv
    integer :: i
    logical :: helmask, helmask_hd
    associate (data => core%data)
      allocate (qn_mask (data%n_in + data%n_out))
      allocate (flv (data%n_flv))
      do i = 1, data%n_in + data%n_out
        call flavor_init (flv, data%flv_state(i,:), model)
        if ((data%n_in == 1 .or. i > data%n_in) &
            .and. any (.not. flavor_is_stable (flv))) then
          helmask = all (flavor_decays_isotropically (flv))
          helmask_hd = all (flavor_decays_diagonal (flv))
          qn_mask(i) = new_quantum_numbers_mask (.false., .true., helmask, &
            mask_hd = helmask_hd)
        else if (i > data%n_in) then
          helmask = all (.not. flavor_is_polarized (flv))
          qn_mask(i) = new_quantum_numbers_mask (.false., .true., helmask)
        else
          qn_mask(i) = new_quantum_numbers_mask (.false., .true., .false.) &
            .or. qn_mask_in(i)
        end if
      end do
      if (core%use_color_factors) then
        call evaluator_init_square (state%matrix, &
          state%int_eff, qn_mask, &
          data%cf_index, data%color_factors, col, nc=core%nc)
      else
        call evaluator_init_square (state%matrix, state%int_eff, &
          qn_mask, nc=core%nc)
      end if
    end associate
    state%has_matrix = .true.
  end subroutine isolated_state_setup_square_matrix

```

This procedure initializes the evaluator that computes the contributions to color flows, neglecting color interference. The incoming-particle mask can be used to sum over incoming flavor.

Helicity handling: see above.

```

(Parton states: isolated state: TBP)+≡
  procedure :: setup_square_flows => isolated_state_setup_square_flows

        expand_color_flows = .true.)
    end associate
    state%has_flows = .true.
  end subroutine isolated_state_setup_square_flows

```

28.3.4 Evaluator initialization: connected state

Setup a trace evaluator as a product of two evaluators (incoming state, effective interaction). In the result, all quantum numbers are summed over.

If the optional `int` interaction is provided, use this for the first factor in the convolution. Otherwise, use the final interaction of the stored `sf_chain`.

The `resonant` flag applies if we want to construct a decay chain. The resonance property can propagate to the final event output.

```

(Parton states: connected state: TBP)+≡
  procedure :: setup_connected_trace => connected_state_setup_connected_trace

(Parton states: procedures)+≡
  subroutine connected_state_setup_connected_trace &
    (state, isolated, int, resonant)

```

```

class (connected_state_t), intent (inout), target :: state
type (isolated_state_t), intent (in), target :: isolated
type (interaction_t), intent (in), optional, target :: int
logical, intent (in), optional :: resonant
type (quantum_numbers_mask_t) :: mask
type (interaction_t), pointer :: src_int
mask = new_quantum_numbers_mask (.true., .true., .true.)
if (present (int)) then
    src_int => int
else
    src_int => isolated%sf_chain_eff%get_out_int_ptr ()
end if
call evaluator_init_product &
    (state%trace, src_int, isolated%trace, mask, mask, &
    connections_are_resonant = resonant)
state%has_trace = .true.
end subroutine connected_state_setup_connected_trace

```

Setup a matrix evaluator as a product of two evaluators (incoming state, effective interaction). In the intermediate state, color and helicity is summed over. In the final state, we keep the quantum numbers which are present in the original evaluators.

```

<Parton states: connected state: TBP>+≡
    procedure :: setup_connected_matrix => connected_state_setup_connected_matrix

<Parton states: procedures>+≡
    subroutine connected_state_setup_connected_matrix &
        (state, isolated, int, resonant)
    class (connected_state_t), intent (inout), target :: state
    type (isolated_state_t), intent (in), target :: isolated
    type (interaction_t), intent (in), optional, target :: int
    logical, intent (in), optional :: resonant
    type (quantum_numbers_mask_t) :: mask
    type (interaction_t), pointer :: src_int
    mask = new_quantum_numbers_mask (.false., .true., .true.)
    if (present (int)) then
        src_int => int
    else
        src_int => isolated%sf_chain_eff%get_out_int_ptr ()
    end if
    call evaluator_init_product &
        (state%matrix, src_int, isolated%matrix, mask, &
        connections_are_resonant = resonant)
    state%has_matrix = .true.
end subroutine connected_state_setup_connected_matrix

```

Setup a matrix evaluator as a product of two evaluators (incoming state, effective interaction). In the intermediate state, only helicity is summed over. In the final state, we keep the quantum numbers which are present in the original evaluators.

If the optional `int` interaction is provided, use this for the first factor in the convolution. Otherwise, use the final interaction of the stored `sf_chain`, after creating an intermediate interaction that includes a correlated color state. We

assume that for a caller-provided `int`, this is not necessary.

```

(Parton states: connected state: TBP)+≡
  procedure :: setup_connected_flows => connected_state_setup_connected_flows

(Parton states: procedures)+≡
  subroutine connected_state_setup_connected_flows &
    (state, isolated, int, resonant)
    class(connected_state_t), intent(inout), target :: state
    type(isolated_state_t), intent(in), target :: isolated
    type(interaction_t), intent(in), optional, target :: int
    logical, intent(in), optional :: resonant
    type(quantum_numbers_mask_t) :: mask
    type(interaction_t), pointer :: src_int
    mask = new_quantum_numbers_mask (.false., .false., .true.)
    if (present (int)) then
      src_int => int
    else
      src_int => isolated%sf_chain_eff%get_out_int_ptr ()
      call evaluator_init_color_contractions (state%flows_sf, src_int)
      state%has_flows_sf = .true.
      src_int => evaluator_get_int_ptr (state%flows_sf)
    end if
    call evaluator_init_product &
      (state%flows, src_int, isolated%flows, mask, &
        connections_are_resonant = resonant)
    state%has_flows = .true.
  end subroutine connected_state_setup_connected_flows

```

28.3.5 Cuts and expressions

Set up the `subevt` that corresponds to the connected interaction. The index arrays refer to the interaction.

We assign the particles as follows: the beam particles are the first two (decay process: one) entries in the trace evaluator. The incoming partons are identified by their link to the outgoing partons of the structure-function chain. The outgoing partons are those of the trace evaluator, which include radiated partons during the structure-function chain.

```

(Parton states: connected state: TBP)+≡
  procedure :: setup_subevt => connected_state_setup_subevt

(Parton states: procedures)+≡
  subroutine connected_state_setup_subevt (state, sf_chain, f_beam, f_in, f_out)
    class(connected_state_t), intent(inout), target :: state
    type(sf_chain_instance_t), intent(in), target :: sf_chain
    type(flavor_t), dimension(:), intent(in) :: f_beam, f_in, f_out
    integer :: n_beam, n_in, n_out, n_vir, n_tot, i, j
    integer, dimension(:), allocatable :: i_beam, i_in, i_out
    integer :: sf_out_i
    type(interaction_t), pointer :: int, sf_int
    int => evaluator_get_int_ptr (state%trace)
    sf_int => sf_chain%get_out_int_ptr ()
    n_beam = size (f_beam)
    n_in = size (f_in)

```

```

n_out = size (f_out)
n_vir = interaction_get_n_vir (int)
n_tot = interaction_get_n_tot (int)
allocate (i_beam (n_beam), i_in (n_in), i_out (n_out))
i_beam = [(i, i = 1, n_beam)]
do j = 1, n_in
    sf_out_i = sf_chain%get_out_i (j)
    i_in(j) = interaction_find_link (int, sf_int, sf_out_i)
end do
i_out = [(i, i = n_vir + 1, n_tot)]
call state%expr%setup_subevt (int, &
    i_beam, i_in, i_out, f_beam, f_in, f_out)
state%has_expr = .true.
end subroutine connected_state_setup_subevt

```

Initialize the variable list specific for this state/term. We insert event variables (`sqrts_hat`) and link the process variable list. The variable list acquires pointers to subobjects of `state`, which must therefore have a `target` attribute.

```

(Parton states: connected state: TBP)+≡
    procedure :: setup_var_list => connected_state_setup_var_list

    class(connected_state_t), intent(inout), target :: state
    class(expr_factory_t), intent(in) :: ef_weight
    call state%expr%setup_weight (ef_weight)
end subroutine connected_state_setup_weight

```

Reset the expression object: invalidate the subevt.

```

<Parton states: connected state: TBP>+≡
    procedure :: reset_expressions => connected_state_reset_expressions

<Parton states: procedures>+≡
    subroutine connected_state_reset_expressions (state)
        class(connected_state_t), intent(inout) :: state
        if (state%has_expr) call state%expr%reset ()
    end subroutine connected_state_reset_expressions

```

28.3.6 Evaluation

Transfer momenta to the trace evaluator and fill the subevt with this effective kinematics, if applicable.

Note: we may want to apply a boost for the subevt.

```

<Parton states: parton state: TBP>+≡
    procedure :: receive_kinematics => parton_state_receive_kinematics

<Parton states: procedures>+≡
    subroutine parton_state_receive_kinematics (state)
        class(parton_state_t), intent(inout), target :: state
        type(interaction_t), pointer :: int
        if (state%has_trace) then
            call evaluator_receive_momenta (state%trace)
            select type (state)
            class is (connected_state_t)
                if (state%has_expr) then
                    int => evaluator_get_int_ptr (state%trace)
                    call state%expr%fill_subevt (int)
                end if
            end select
        end if
    end subroutine parton_state_receive_kinematics

```

Recover kinematics: We assume that the trace evaluator is filled with momenta. Send those momenta back to the sources, then fill the variables and subevent as above.

The incoming momenta of the connected state are not connected to the isolated state but to the beam interaction. Therefore, the incoming momenta within the isolated state do not become defined, yet. Instead, we reconstruct the beam (and ISR) momentum configuration.

```

(Parton states: parton state: TBP)+≡
  procedure :: send_kinematics => parton_state_send_kinematics

(Parton states: procedures)+≡
  subroutine parton_state_send_kinematics (state)

28.4 Complete Elementary Processes

This module combines hard interactions, phase space, and (for scatterings) structure functions and interfaces them to the integration module.

The process object implements the combination of a fixed beam and structure-function setup with a number of elementary processes. The latter are called process components. The process object represents an entity which is supposedly observable. It should be meaningful to talk about the cross section of a process.

The individual components of a process are, technically, processes themselves, but they may have unphysical cross sections which have to be added for a physical result. Process components may be exclusive tree-level elementary processes, dipole subtraction term, loop corrections, etc.

The beam and structure function setup is common to all process components. Thus, there is only one instance of this part.

The process may be a scattering process or a decay process. In the latter case, there are no structure functions, and the beam setup consists of a single particle. Otherwise, the two classes are treated on the same footing.

Once a sampling point has been chosen, a process determines a set of partons with a correlated density matrix of quantum numbers. In general, each sampling point will generate, for each process component, one or more distinct parton configurations. This is the **computed** state. The computed state is the subject of the multi-channel integration algorithm.

For NLO computations, it is necessary to project the computed states onto another set of parton configurations (e.g., by recombining certain pairs). This is the **observed** state. When computing partonic observables, the information is taken from the observed state.

For the purpose of event generation, we will later select one parton configuration from the observed state and collapse the correlated quantum state. This configuration is then dressed by applying parton shower, decays and hadronization. The decay chain, in particular, combines a scattering process with possible subsequent decay processes on the parton level, which are full-fledged process objects themselves.

28.4.1 The Process Object

A process object is the workspace for creating process instances for event generation. After initialization, its contents are filled by integration passes which shape the integration grids and compute cross sections. Processes are set up initially from user-level configuration data. After calculating integrals and thus developing integration grid data, the program may use a process object or a copy of it for the purpose of generating events

The process object consists of several subobjects with their specific purposes. The corresponding types are defined below. (Technically, the subobject type definitions have to come before the process type definition, but with NOWEB magic we reverse this order here.)

The **type** determines whether we are considering a decay or a scattering process.

The **meta** object describes the process and its environment. All contents become fixed when the object is initialized.

The **config** object holds physical and technical configuration data that have been obtained during process initialization, and which are common to all process components.

The individual process components are configured in the **component** objects. These objects contain more configuration parameters and workspace, as needed for the specific process variant.

The **term** objects describe parton configurations which are technically used as phase-space points. Each process component may split into several terms with distinct kinematics and particle content. Furthermore, each term may project on a different physical state, e.g., by particle recombination. The **term** object provides the framework for this projection, for applying cuts, weight, and thus completing the process calculation.

The **beam_config** object describes the incoming particles, either the decay mother or the scattering beams. It also contains the structure-function infor-

mation.

The `mci_entry` objects configure a MC input parameter set and integrator, each. The number of parameters depends on the process component and on the beam and structure-function setup.

```

<Processes: public>≡
    public :: process_t
<Processes: process type>≡
    type :: process_t
    private
    type(process_metadata_t) :: &
        meta
    type(process_config_data_t) :: &
        config
    type(process_counter_t) :: &
        counter
    type(process_component_t), dimension(:), allocatable :: &
        component
    type(process_term_t), dimension(:), allocatable :: &
        term
    type(process_beam_config_t) :: &
        beam_config
    type(process_mci_entry_t), dimension(:), allocatable :: &
        mci_entry
    logical :: nlo_process
    contains
    <Processes: process: TBP>
end type process_t

```

This procedure is an important debugging and inspection tool; it is not used during normal operation. The process object is written to a file (identified by unit, which may also be standard output). Optional flags determine whether we show everything or just the interesting parts.

    end do
end associate
end associate
k = k + n_entry(i)
end do
process%config%n_terms = n_tot
end subroutine process_setup_terms

```

Initialize the beam setup. This is the trivial version where the incoming state of the matrix element coincides with the initial state of the process. For a scattering process, we need the c.m. energy, all other variables are set to their default values (no polarization, lab frame and c.m. frame coincide, etc.)

We assume that all components consistently describe a scattering process, i.e., two incoming particles.

Note: The current layout of the `beam_data_t` record requires that the flavor for each beam is unique. For processes with multiple flavors in the initial state, one has to set up beams explicitly. This restriction could be removed by extending the code in the `beams` module.

(Processes: process: TBP)+≡

```

```

Initialize from a complete beam setup.

```

<Processes: process: TBP>+=
  procedure :: setup_beams_beam_structure => process_setup_beams_beam_structure

<Processes: procedures>+=
  subroutine process_setup_beams_beam_structure &
    (process, beam_structure, sqrts, decay_rest_frame)
    class(process_t), intent(inout) :: process
    type(beam_structure_t), intent(in) :: beam_structure
    real(default), intent(in) :: sqrts
    logical, intent(in), optional :: decay_rest_frame
    if (process%get_n_in () == beam_structure%get_n_beam ()) then
      call process%beam_config%init_beam_structure &

```

```

        (beam_structure, sqrts, process%get_model_ptr (), decay_rest_frame)
    else if (beam_structure%get_n_beam () == 0) then
        call msg_fatal ("Asymmetric beams: missing beam particle specification")
    else
        call msg_fatal ("Mismatch of process and beam setup (scattering/decay)")
    end if
end subroutine process_setup_beams_beam_structure

```

Notify the user about beam setup.

```

<Processes: process: TBP>+=
    procedure :: beams_startup_message => process_beams_startup_message

<Processes: procedures>+=
    subroutine process_beams_startup_message (process, unit, beam_structure)
        class(process_t), intent(in) :: process
        integer, intent(in), optional :: unit
        type(beam_structure_t), intent(in), optional :: beam_structure
        call process%beam_config%startup_message (unit, beam_structure)
    end subroutine process_beams_startup_message

```

We complete the kinematics configuration after the beam setup, but before we configure the chain of structure functions. The reason is that we need the total energy `sqrts` for the kinematics, but the structure-function setup requires the number of channels, which depends on the kinematics configuration. For instance, the kinematics module may return the need for parameterizing an s-channel resonance.

```

<Processes: process: TBP>+=
    procedure :: configure_phs => process_configure_phs

<Processes: procedures>+=
    subroutine process_configure_phs (process, rebuild, ignore_mismatch)
        class(process_t), intent(inout) :: process
        logical, intent(in), optional :: rebuild
        logical, intent(in), optional :: ignore_mismatch
        real(default) :: sqrts
        integer :: i, i_born
