WHIZARD¹

Wolfgang Kilian,² Thorsten Ohl,³ Jürgen Reuter⁴

Version 2.2.3, Nov 30 2014

with contributions from: Fabian Bach, Felix Braam, Bijan
Chokoufé Nejad, David Gordo Gomez, Sebastian Schmidt, Marco
Sekulla, Christian Speckner, Christian Weiss, Daniel Wiesler

¹The original meaning of the acronym is *W, Higgs, Z, And Respective Decays*. The current program is much more than that, however.

Abstract

WHIZARD is an application of the VAMP algorithm: Adaptive multi-channel integration and event generation. The bare VAMP library is augmented by modules for Lorentz algebra, particles, phase space, etc., such that physical processes with arbitrary complex final states [well, in principle. . .] can be integrated and *unweighted* events be generated.

21.2.3	Tables of states	1589
21.2.4	Top-level methods	1595
21.2.5	Splitting algorithm	1596
21.2.6	Tools	1600
21.2.7	Access results	1600
21.2.8	Unit tests	1601
22	Structure Function Implementations	1610
22.1	Photon radiation: ISR	1610
22.1.1	Physics	1611
22.1.2	Implementation	1613
22.1.3	The ISR data block	1613
22.1.4	The ISR object	1618
22.1.5	Kinematics	1619
22.1.6	ISR application	1622
22.1.7	Unit tests	1623
22.2	EPA	1636
22.2.1	Physics	1636
22.2.2	The EPA data block	1637
22.2.3	The EPA object	1641
22.2.4	Kinematics	1644
22.2.5	EPA application	1646
22.2.6	Unit tests	1647
22.3	EWA	1658
22.3.1	Physics	1658
22.3.2	The EWA data block	1660
22.3.3	The EWA object	1665
22.3.4	Kinematics	1669
22.3.5	EWA application	1672
22.3.6	Unit tests	1673
22.4	Lepton collider beamstrahlung: CIRCE1	1684
22.4.1	Physics	1684

22.4.2	The CIRCE1 data block	1685
22.4.3	Random Number Generator for CIRCE	1689
22.4.4	The CIRCE1 object	1689
22.4.5	Kinematics	1692
22.4.6	CIRCE1 application	1694
22.4.7	Unit tests	1695
22.5	Lepton Collider Beamstrahlung and Photon collider: CIRCE2 . .	1702
22.5.1	Physics	1702
22.5.2	The CIRCE2 data block	1703
22.5.3	Random Number Generator for CIRCE	1707
22.5.4	The CIRCE2 object	1707
22.5.5	Kinematics	1709
22.5.6	CIRCE2 application	1711
22.5.7	Unit tests	1712
22.6	Energy-scan spectrum	1718
22.6.1	Data type	1719
22.6.2	The Energy-scan object	1721
22.6.3	Kinematics	1723
22.6.4	Energy scan application	1724
22.6.5	Unit tests	1725
22.7	Using beam event data	1728
22.7.1	Data type	1729
22.7.2	The beam events object	1732
22.7.3	Kinematics	1734
22.7.4	Beam events application	1736
22.7.5	Unit tests	1736
22.8	LHAPDF	1740
22.8.1	The module	1740
22.8.2	Codes for default PDF sets	1741
22.8.3	LHAPDF library interface	1741
22.8.4	The LHAPDF status	1743
22.8.5	LHAPDF initialization	1744
22.8.6	Kinematics	1746
22.8.7	The LHAPDF data block	1747
22.8.8	The LHAPDF object	1752
22.8.9	Structure function	1754
22.8.10	Strong Coupling	1756
22.8.11	Unit tests	1757
22.9	Builtin PDF sets	1762
22.9.1	The module	1762
22.9.2	Codes for default PDF sets	1763
22.9.3	The PDF builtin data block	1763
22.9.4	The PDF object	1767
22.9.5	Kinematics	1769
22.9.6	Structure function	1770
22.9.7	Strong Coupling	1771
22.9.8	Unit tests	1772
22.10	User Plugin for Structure Functions	1777
22.10.1	The module	1777
22.10.2	The user structure function data block	1778

22.10.3	The interaction	1781
22.10.4	The user structure function	1783
22.10.5	Kinematics	1784
22.11	HOPPET interface	1786
23	Phase space and hard matrix elements	1788
23.1	Single-particle phase space	1789
23.1.1	Configuration	1789
23.1.2	Kinematics implementation	1791
23.1.3	Unit tests	1795
23.2	Mappings	1803
23.2.1	Default parameters	1803
23.2.2	The Mapping type	1805
23.2.3	Screen output	1805
23.2.4	Define a mapping	1806
23.2.5	Retrieve contents	1808
23.2.6	Compare mappings	1809
23.2.7	Mappings of the invariant mass	1810
23.2.8	Step mapping	1816
23.2.9	Mappings of the polar angle	1818
23.3	Phase-space trees	1822
23.3.1	Particles	1823
23.3.2	The phase-space tree type	1826
23.3.3	PHS tree setup	1830
23.3.4	Phase-space evaluation	1841
23.4	The phase-space forest	1852
23.4.1	Phase-space setup parameters	1853
23.4.2	Equivalences	1855
23.4.3	Groves	1857
23.4.4	The forest type	1859
23.4.5	Screen output	1861
23.4.6	Accessing contents	1864
23.4.7	Read the phase space setup from file	1866
23.4.8	Preparation	1873
23.4.9	Accessing the particle arrays	1875
23.4.10	Find equivalences among phase-space trees	1877
23.4.11	Interface for channel equivalences	1878
23.4.12	Phase-space evaluation	1879
23.4.13	Unit tests	1882
23.5	Finding phase space parameterizations	1885
23.5.1	The mapping modes	1886
23.5.2	The cascade type	1886
23.5.3	Creating new cascades	1893
23.5.4	Tools	1894
23.5.5	Hash entries for cascades	1895
23.5.6	The cascade set	1898
23.5.7	Adding cascades	1907
23.5.8	External particles	1909
23.5.9	Cascade combination I: flavor assignment	1912
23.5.10	Cascade combination II: kinematics setup and check	1913

23.5.11	Cascade combination III: node connections and tree fusion	1919
23.5.12	Cascade set generation	1922
23.5.13	Groves	1925
23.5.14	Generate the phase space file	1926
23.5.15	Unit tests	1928
23.6	WOOD phase space	1929
23.6.1	Configuration	1930
23.6.2	Phase-space generation	1933
23.6.3	Phase-space configuration	1935
23.6.4	Kinematics implementation	1942
23.6.5	Evaluation	1943
23.6.6	Unit tests	1944
24	Random-Number Generator Implementation	1961

25.2	Identifying singular regions	1977
25.3	The FKS phase space	2006
25.3.1	Creation of the real phase space - FSR	2014
25.3.2	Creation of the real phase space - ISR	2018
25.4	Implementation of the Calculation	2019
25.4.1	The real contribution to the cross section	2034
25.4.2	Collinear counterterms	2039
25.4.3	Virtual contribution to the cross section	2042
25.4.4	Putting it together	2046
26	Multi-Channel Integration	2058
26.1	Simple midpoint integration	2058
26.1.1	Integrator	2059
26.1.2	Integrator instance	2065
26.1.3	Unit tests	2069
26.2	VAMP interface	2084
26.2.1	Grid parameters	2086
26.2.2	History parameters	2087
26.2.3	Integration pass	2087
26.2.4	Integrator	2094
26.2.5	Sampler as Workspace	2114
26.2.6	Integrator instance	2114
26.2.7	Sampling function	2124
26.2.8	Integrator instance: evaluation	2125
26.2.9	VAMP exceptions	2127
26.2.10	Unit tests	2127
27	Process Libraries	2166

28 Integration and Process Objects	2167
28.1 Abstract process core	2167
28.1.1 The process core	2168
28.1.2 Storage for intermediate results	2174
28.1.3 Helicity selection data	2174
28.2 Process observables	2175
28.2.1 Abstract base type	2176
28.2.2 Initialization	2177
28.2.3 Evaluation	2178
28.2.4 Implementation for partonic events	2179
28.2.5 Implementation for full events	2186
28.3 Parton states	2192
28.3.1 Abstract base type	2193
28.3.2 Common Initialization	2196
28.3.3 Evaluator initialization: isolated state	2197
28.3.4 Evaluator initialization: connected state	2199
28.3.5 Cuts and expressions	2201
28.3.6 Evaluation	2203
28.3.7 Accessing the state	2206
28.4 Complete Elementary Processes	2207
28.4.1 The Process Object	2209
28.4.2 Metadata	2235
28.4.3 Generic Configuration Data	2240
28.4.4 Beam configuration	2243
28.4.5 Multi-channel integration	2251
28.4.6 Process Components	2259
28.4.7 Process terms	2264
28.4.8 Default Iterations	2268
28.4.9 Constant process data	2271
28.4.10 Compute an amplitude	2276
28.4.11 Process instances	2278
28.4.12 Accessing the process instance	2326
28.4.13 Particle sets	2331
28.4.14 Unit tests	2333
28.5 Process Stacks	2368
28.5.1 The process entry type	2369
28.5.2 The process stack type	2370
28.5.3 Link	2372
28.5.4 Push	2373
28.5.5 Data Access	2374
28.5.6 Unit tests	2374
29 Parton shower and interface to hadronization	2380
29.1 Basics of the shower	2380
29.1.1 PDF Parameters	2380
29.1.2 Additional parameters	2381
29.2 Parton module for the shower	2388
29.2.1 The basic type definitions	2388
29.2.2 Routines	2389
29.2.3 The analytic FSR	2405

29.3	Main shower module	2410
29.4	Talking to PYTHIA	2485
29.5	Matching	2501
29.5.1	MLM matching	2501
29.5.2	CKKW matching	2537

```

We are strict with our names:

```
<Standard module head>≡
  implicit none
  private
```

This is the way to invoke the kinds module (not contained in this source)

```
<Use kinds>≡  
  use kinds, only: default
```

And we make heavy use of variable-length strings

```
<Use strings>≡  
  use iso_varying_string, string_t => varying_string
```

Chapter 3

Utilities

These modules are intended as part of WHIZARD, but in fact they are generic and could be useful for any purpose.

The modules depend only on modules from the **basics** set.

file_utils Procedures that deal with external files, if not covered by Fortran built-ins.

string_utils Some string-handling utilities. Includes conversion to C string.

format_utils Utilities for pretty-printing.

format_defs Predefined format strings.

3.1 File Utilities

This module provides miscellaneous tools associated with named external files. Currently only:

- Delete a named file

```
<file_utils.f90>≡  
<File header>  
  
module file_utils  
  
    use io_units  
  
<Standard module head>  
  
<File utils: public>  
  
contains  
  
<File utils: procedures>  
  
end module file_utils
```

3.1.1 Deleting a file

Fortran does not contain a command for deleting a file. Here, we provide a subroutine that deletes a file if it exists. We do not handle the subtleties, so we assume that it is writable if it exists.

```
<File utils: public>≡
    public :: delete_file

<File utils: procedures>≡
    subroutine delete_file (name)
        character(*), intent(in) :: name
        logical :: exist
        integer :: u
        inquire (file = name, exist = exist)
        if (exist) then
            u = free_unit ()
            open (unit = u, file = name)
            close (u, status = "delete")
        end if
    end subroutine delete_file
```

3.2 String Utilities

This module provides tools associated with strings (built-in and variable). Currently:

- Upper and lower case for strings
- Convert to null-terminated C string

```
<string_utils.f90>≡
<File header>

    module string_utils

        use, intrinsic :: iso_c_binding
        <Use strings>

        <Standard module head>

        <String utils: public>

        <String utils: interfaces>

        contains

        <String utils: procedures>

    end module string_utils
```

3.2.1 Upper and Lower Case

These are, unfortunately, not part of Fortran.

```
<String utils: public>≡
    public :: upper_case
    public :: lower_case

<String utils: interfaces>≡
    interface upper_case
        module procedure upper_case_char, upper_case_string
    end interface
    interface lower_case
        module procedure lower_case_char, lower_case_string
    end interface

<String utils: procedures>≡
    function upper_case_char (string) result (new_string)
        character(*), intent(in) :: string
        character(len(string)) :: new_string
        integer :: pos, code
        integer, parameter :: offset = ichar('A')-ichar('a')
        do pos = 1, len (string)
            code = ichar (string(pos:pos))
            select case (code)
                case (ichar('a'):ichar('z'))
                    new_string(pos:pos) = char (code + offset)
                case default
                    new_string(pos:pos) = string(pos:pos)
            end select
        end do
    end function upper_case_char

    function lower_case_char (string) result (new_string)
        character(*), intent(in) :: string
        character(len(string)) :: new_string
        integer :: pos, code
        integer, parameter :: offset = ichar('a')-ichar('A')
        do pos = 1, len (string)
            code = ichar (string(pos:pos))
            select case (code)
                case (ichar('A'):ichar('Z'))
                    new_string(pos:pos) = char (code + offset)
                case default
                    new_string(pos:pos) = string(pos:pos)
            end select
        end do
    end function lower_case_char

    function upper_case_string (string) result (new_string)
        type(string_t), intent(in) :: string
        type(string_t) :: new_string
        new_string = upper_case_char (char (string))
    end function upper_case_string

    function lower_case_string (string) result (new_string)
```

```

    type(string_t), intent(in) :: string
    type(string_t) :: new_string
    new_string = lower_case_char (char (string))
end function lower_case_string

```

3.2.2 C-compatible Output

Convert a FORTRAN string into a zero terminated C string.

```

<String utils: public>+≡
    public :: string_f2c

<String utils: interfaces>+≡
    interface string_f2c
        module procedure string_f2c_char, string_f2c_var_str
    end interface string_f2c

<String utils: procedures>+≡
    pure function string_f2c_char (i) result (o)
        character(*), intent(in) :: i
        character(kind=c_char, len=len (i) + 1) :: o
        o = i // c_null_char
    end function string_f2c_char

    pure function string_f2c_var_str (i) result (o)
        type(string_t), intent(in) :: i
        character(kind=c_char, len=len (i) + 1) :: o
        o = char (i) // c_null_char
    end function string_f2c_var_str

```

3.3 Format Utilities

This module provides miscellaneous tools associated with formatting and pretty-printing.

- Horizontal separator lines in output
- Indenting an output line
- Formatting a number for T_EX output.
- Formatting a number for MetaPost output.
- Alternate numeric formats.

```

<format_utils.f90>≡
    <File header>

    module format_utils

        <Use kinds>
        <Use strings>
        use string_utils, only: lower_case

```

```

⟨Standard module head⟩

⟨Format utils: public⟩

contains

⟨Format utils: procedures⟩

end module format_utils

```

3.3.1 Line Output

Write a separator line.

```

⟨Format utils: public⟩≡
    public :: write_separator

⟨Format utils: procedures⟩≡
    subroutine write_separator (u, mode)
        integer, intent(in) :: u
        integer, intent(in), optional :: mode
        integer :: m
        m = 1; if (present (mode)) m = mode
        select case (m)
        case default
            write (u, "(A)") repeat("-", 72)
        case (1)
            write (u, "(A)") repeat("-", 72)
        case (2)
            write (u, "(A)") repeat("=", 72)
        end select
    end subroutine write_separator

```

Indent the line with given number of blanks.

```

⟨Format utils: public⟩+≡
    public :: write_indent

⟨Format utils: procedures⟩+≡
    subroutine write_indent (unit, indent)
        integer, intent(in) :: unit
        integer, intent(in), optional :: indent
        if (present (indent)) then
            write (unit, "(1x,A)", advance="no") repeat(" ", indent)
        end if
    end subroutine write_indent

```

3.3.2 T_EX-compatible Output

Quote underscore characters for use in T_EX output.

```

⟨Format utils: public⟩+≡
    public :: quote_underscore

```

```

<Format utils: procedures>+≡
function quote_underscore (string) result (quoted)
  type(string_t) :: quoted
  type(string_t), intent(in) :: string
  type(string_t) :: part
  type(string_t) :: buffer
  buffer = string
  quoted = ""
  do
    call split (part, buffer, "_")
    quoted = quoted // part
    if (buffer == "") exit
    quoted = quoted // "\"
  end do
end function quote_underscore

```

Format a number with n significant digits for use in T_EX documents.

```

<Format utils: public>+≡
public :: tex_format

<Format utils: procedures>+≡
function tex_format (rval, n_digits) result (string)
  type(string_t) :: string
  real(default), intent(in) :: rval
  integer, intent(in) :: n_digits
  integer :: e, n, w, d
  real(default) :: absval
  real(default) :: mantissa
  character :: sign
  character(20) :: format
  character(80) :: cstr
  n = min (abs (n_digits), 16)
  if (rval == 0) then
    string = "0"
  else
    absval = abs (rval)
    e = log10 (absval)
    if (rval < 0) then
      sign = "-"
    else
      sign = ""
    end if
    select case (e)
    case (:-3)
      d = max (n - 1, 0)
      w = max (d + 2, 2)
      write (format, "('(F',IO,'.',IO,'A,IO,A)')") w, d
      mantissa = absval * 10._default ** (1 - e)
      write (cstr, fmt=format) mantissa, "\times 10^{", e - 1, "}"
    case (-2:0)
      d = max (n - e, 1 - e)
      w = max (d + e + 2, d + 2)
      write (format, "('(F',IO,'.',IO,')')") w, d
      write (cstr, fmt=format) absval

```

```

case (1:2)
  d = max (n - e - 1, -e, 0)
  w = max (d + e + 2, d + 2, e + 2)
  write (format, "(('F',IO,'.',IO,''))" w, d)
  write (cstr, fmt=format) absval
case default
  d = max (n - 1, 0)
  w = max (d + 2, 2)
  write (format, "(('F',IO,'.',IO,'A,IO,A'))" w, d)
  mantissa = absval * 10._default ** (- e)
  write (cstr, fmt=format) mantissa, "\times 10^{", e, "}"
end select
string = sign // trim (cstr)
end if
end function tex_format

```

3.3.3 Metapost-compatible Output

Write a number for use in Metapost code:

```

<Format utils: public>+≡
  public :: mp_format
<Format utils: procedures>+≡
  function mp_format (rval) result (string)
    type(string_t) :: string
    real(default), intent(in) :: rval
    character(16) :: tmp
    write (tmp, "(G16.8)") rval
    string = lower_case (trim (adjustl (trim (tmp))))
  end function mp_format

```

3.3.4 Conditional Formatting

Conditional format string, intended for switchable numeric precision.

```

<Format utils: public>+≡
  public :: pac_fmt
<Format utils: procedures>+≡
  subroutine pac_fmt (fmt, fmt_orig, fmt_pac, pacify)
    character(*), intent(in) :: fmt_orig, fmt_pac
    character(*), intent(out) :: fmt
    logical, intent(in), optional :: pacify
    logical :: pacified
    pacified = .false.
    if (present (pacify)) pacified = pacify
    if (pacified) then
      fmt = fmt_pac
    else
      fmt = fmt_orig
    end if
  end subroutine pac_fmt

```

3.4 Format Definitions

This module provides named integer parameters that specify certain format strings, used for numerical output.

```
<format_defs.f90>≡  
  <File header>
```

```
  module format_defs
```

```
    <Standard module head>
```

```
    <Format defs: public parameters>
```

```
  end module format_defs
```

We collect format strings for various numerical output formats here.

```
<Format defs: public parameters>≡  
  character(*), parameter, public :: FMT_19 = "ES19.12"  
  character(*), parameter, public :: FMT_18 = "ES18.11"  
  character(*), parameter, public :: FMT_17 = "ES17.10"  
  character(*), parameter, public :: FMT_16 = "ES16.9"  
  character(*), parameter, public :: FMT_15 = "ES15.8"  
  character(*), parameter, public :: FMT_14 = "ES14.7"  
  character(*), parameter, public :: FMT_13 = "ES13.6"  
  character(*), parameter, public :: FMT_12 = "ES12.5"  
  character(*), parameter, public :: FMT_11 = "ES11.4"  
  character(*), parameter, public :: FMT_10 = "ES10.3"
```

Chapter 4

Testing

This part contains tools for automatic testing.

unit_tests A handler that executes test procedures and compares and collects results.

4.1 Unit tests

We provide functionality for automated unit tests. Each test is required to produce output which is compared against a reference file. If the two are identical, we signal success. Otherwise, we signal failure and write the output to a file.

```
(unit_tests.f90)≡  
  <File header>  
  
  module unit_tests  
  
    <Use strings>  
    use io_units  
  
    <Standard module head>  
  
    <Tests: public>  
  
    <Tests: parameters>  
  
    <Tests: types>  
  
    <Tests: interfaces>  
  
    contains  
  
    <Tests: procedures>  
  
  end module unit_tests
```

4.1.1 Parameters

Building blocks of file names. The directory names and suffixes are hard-coded here, and they must reflect actual Makefile targets where applicable.

```
<Tests: parameters>≡
    character(*), parameter :: ref_prefix = "ref-output/"
    character(*), parameter :: ref = ".ref"

    character(*), parameter :: err_prefix = "err-output/"
    character(*), parameter :: err = ".out"
```

4.1.2 Type for storing test results

We store the results of the individual unit tests in a linked list. Here is the entry:

```
<Tests: public>≡
    public :: test_results_t

<Tests: types>≡
    type :: test_result_t
        logical :: success = .false.
        type(string_t) :: name
        type(string_t) :: description
        type(test_result_t), pointer :: next => null ()
    end type test_result_t

    type :: test_results_t
        private
        type(test_result_t), pointer :: first => null ()
        type(test_result_t), pointer :: last => null ()
        integer :: n_success = 0
        integer :: n_failure = 0
        contains
        <Tests: test results: TBP>
    end type test_results_t
```

Add a test result.

```
<Tests: test results: TBP>≡
    procedure, private :: add => test_results_add

<Tests: procedures>≡
    subroutine test_results_add (list, name, description, success)
        class(test_results_t), intent(inout) :: list
        character(len=*), intent(in) :: name
        character(len=*), intent(in) :: description
        logical, intent(in) :: success
        type(test_result_t), pointer :: result
        allocate (result)
        result%success = success
        result%name = name
        result%description = description
        if (associated (list%first)) then
            list%last%next => result
        end if
    end subroutine
```

```

else
    list%first => result
end if
list%last => result
if (success) then
    list%n_success = list%n_success + 1
else
    list%n_failure = list%n_failure + 1
end if
end subroutine test_results_add

```

Display the current state.

(Tests: test results: TBP)+≡

```

procedure, private :: write => test_results_write

```

(Tests: procedures)+≡

```

subroutine test_results_write (list, u)
class(test_results_t), intent(in) :: list
integer, intent(in) :: u
type(test_result_t), pointer :: result
write (u, "(A)")  "*** Test Summary ***"
if (list%n_success > 0) then
    write (u, "(2x,A)")  "Success:"
    result => list%first
    do while (associated (result))
        if (result%success) write (u, "(4x,A,': ',A)") &
            char (result%name), char (result%description)
        result => result%next
    end do
end if
if (list%n_failure > 0) then
    write (u, "(2x,A)")  "Failure:"
    result => list%first
    do while (associated (result))
        if (.not. result%success) write (u, "(4x,A,': ',A)") &
            char (result%name), char (result%description)
        result => result%next
    end do
end if
write (u, "(A,I0)")  "Total    = ", list%n_success + list%n_failure
write (u, "(A,I0)")  "Success = ", list%n_success
write (u, "(A,I0)")  "Failure = ", list%n_failure
write (u, "(A)")  "*** End of test Summary ***"
end subroutine test_results_write

```

Return true if all tests were successful (or no test).

(Tests: test results: TBP)+≡

```

procedure, private :: report => test_results_report

```

(Tests: procedures)+≡

```

subroutine test_results_report (list, success)
class(test_results_t), intent(in) :: list
logical, intent(out) :: success
success = list%n_failure == 0

```

```
end subroutine test_results_report
```

Delete the list.

```
<Tests: test results: TBP>+=
  procedure, private :: final => test_results_final

<Tests: procedures>+=
  subroutine test_results_final (list)
    class(test_results_t), intent(inout) :: list
    type(test_result_t), pointer :: result
    do while (associated (list%first))
      result => list%first
      list%first => result%next
      deallocate (result)
    end do
    list%last => null ()
    list%n_success = 0
    list%n_failure = 0
  end subroutine test_results_final
```

4.1.3 Wrapup

This will write results, report status, and finalize. This is the only method which we need to access from outside.

```
<Tests: test results: TBP>+=
  procedure :: wrapup => test_results_wrapup

<Tests: procedures>+=
  subroutine test_results_wrapup (list, u, success)
    class(test_results_t), intent(inout) :: list
    integer, intent(in) :: u
    logical, intent(out), optional :: success
    call list%write (u)
    if (present (success)) call list%report (success)
    call list%final ()
  end subroutine test_results_wrapup
```

4.1.4 Tool for Unit Tests

This procedure takes a test routine as an argument. It runs the test, output directed to a temporary file. Then, it compares the file against a reference file.

The test routine must take the output unit as argument.

```
<Tests: interfaces>=
  abstract interface
    subroutine unit_test (u)
      integer, intent(in) :: u
    end subroutine unit_test
  end interface
```

The test routine can print to screen and, optionally, to a logging unit.

```

<Tests: public>+≡
    public :: test
<Tests: procedures>+≡
    subroutine test (test_proc, name, description, u_log, results)
        procedure(unit_test) :: test_proc
        character(*), intent(in) :: name
        character(*), intent(in) :: description
        integer, intent(in) :: u_log
        type(test_results_t), intent(inout) :: results
        integer :: u_test, u_ref, u_err
        logical :: exist
        character(256) :: buffer1, buffer2
        integer :: iostat1, iostat2
        logical :: success
        write (*, "(A)", advance="no") "Running test: " // name
        write (u_log, "(A)") "Test: " // name
        u_test = free_unit ()
        open (u_test, status="scratch", action="readwrite")
        call test_proc (u_test)
        rewind (u_test)
        inquire (file=ref_prefix//name//ref, exist=exist)
        if (exist) then
            u_ref = free_unit ()
            open (u_ref, file=ref_prefix//name//ref, status="old", action="read")
            COMPARE_FILES: do
                read (u_test, "(A)", iostat=iostat1) buffer1
                read (u_ref, "(A)", iostat=iostat2) buffer2
                if (iostat1 /= iostat2) then
                    success = .false.
                    exit COMPARE_FILES
                else if (iostat1 < 0) then
                    success = .true.
                    exit COMPARE_FILES
                else if (buffer1 /= buffer2) then
                    success = .false.
                    exit COMPARE_FILES
                end if
            end do COMPARE_FILES
            close (u_ref)
        else
            write (*, "(A)", advance="no") " ... no reference output available"
            write (u_log, "(A)") " No reference output available."
            success = .false.
        end if
        if (success) then
            write (*, "(A)") " ... success."
            write (u_log, "(A)") " Success."
        else
            write (*, "(A)") " ... failure. See: " // err_prefix//name//err
            write (u_log, "(A)") " Failure."
            rewind (u_test)
            u_err = free_unit ()
            open (u_err, file=err_prefix//name//err, &

```

```

        action="write", status="replace")
WRITE_OUTPUT: do
    read (u_test, "(A)", end=1) buffer1
    write (u_err, "(A)") trim (buffer1)
end do WRITE_OUTPUT
1    close (u_err)
end if
close (u_test)
call results%add (name, description, success)
end subroutine test

```

Chapter 5

System: Interfaces and Handlers

Here, we collect modules that deal with the “system”: operating-system interfaces, error handlers and diagnostics.

system_defs Constants relevant for the modules in this set.

diagnostics Error and diagnostic message handling. Any messages and errors issued by WHIZARD functions are handled by the subroutines in this module, if possible.

os_interface Execute system calls, build and link external object files and libraries.

cputime Timer data type and methods, for measuring performance.

5.1 Constants

The parameters here are used in various parts of the program, starting from the modules in the current chapter. Some of them may be modified if the need arises.

```
<system_defs.f90>≡  
  <File header>  
  
  module system_defs  
  
    use, intrinsic :: iso_fortran_env, only: iostat_end, iostat_eor !NODEP!  
  
    <Standard module head>  
  
    <System defs: public parameters>  
  
  end module system_defs
```

5.1.1 Version

The version string is used for checking files. Note that the string length MUST NOT be changed, because reading binary files relies on it.

```
<System defs: public parameters>≡  
    integer, parameter, public :: VERSION_STRLEN = 255  
    character(len=VERSION_STRLEN), parameter, public :: &  
        & VERSION_STRING = "WHIZARD version <Version> (<Date>)"
```

5.1.2 Text Buffer

There is a hard limit on the line length which we should export. This buffer size is used both by the message handler, the lexer, and some further modules.

```
<System defs: public parameters>+≡  
    integer, parameter, public :: BUFFER_SIZE = 1000
```

5.1.3 IOSTAT Codes

Defined in `iso_fortran_env`, but we would like to use shorthands.

```
<System defs: public parameters>+≡  
    integer, parameter, public :: EOF = iostat_end, EOR = iostat_eor
```

5.1.4 Character Codes

Single-character constants.

```
<System defs: public parameters>+≡  
    character, parameter, public :: BLANK = ' '  
    character, parameter, public :: TAB = achar(9)  
    character, parameter, public :: CR = achar(13)  
    character, parameter, public :: LF = achar(10)  
    character, parameter, public :: BACKSLASH = achar(92)
```

Character strings that indicate character classes.

```
<System defs: public parameters>+≡  
    character(*), parameter, public :: WHITESPACE_CHARS = BLANK// TAB // CR // LF  
    character(*), parameter, public :: LCLETTERS = "abcdefghijklmnopqrstuvwxyz"  
    character(*), parameter, public :: UCLETTERS = "ABCDEFGHIJKLMNOPQRSTUVWXYZ"  
    character(*), parameter, public :: DIGITS = "0123456789"
```

5.2 C wrapper for sigaction

This implements calls to `sigaction` and the appropriate signal handlers in C. The functionality is needed for the `diagnostics` module.

```
<signal_interface.c>≡  
    /*
```

```

<File header>
*/
#include <signal.h>
#include <stdlib.h>

extern int wo_sigint;
extern int wo_sigterm;
extern int wo_sigxcpu;
extern int wo_sigxfsz;

static void wo_handler_sigint (int sig) {
    wo_sigint = sig;
}

static void wo_handler_sigterm (int sig) {
    wo_sigterm = sig;
}

static void wo_handler_sigxcpu (int sig) {
    wo_sigxcpu = sig;
}

static void wo_handler_sigxfsz (int sig) {
    wo_sigxfsz = sig;
}

int wo_mask_sigint () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = wo_handler_sigint;
    return sigaction(SIGINT, &sa, NULL);
}

int wo_mask_sigterm () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = wo_handler_sigterm;
    return sigaction(SIGTERM, &sa, NULL);
}

int wo_mask_sigxcpu () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = wo_handler_sigxcpu;
    return sigaction(SIGXCPU, &sa, NULL);
}

```

```

}

int wo_mask_sigxfsz () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = wo_handler_sigxfsz;
    return sigaction(SIGXFSZ, &sa, NULL);
}

int wo_release_sigint () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = SIG_DFL;
    return sigaction(SIGINT, &sa, NULL);
}

int wo_release_sigterm () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = SIG_DFL;
    return sigaction(SIGTERM, &sa, NULL);
}

int wo_release_sigxcpu () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = SIG_DFL;
    return sigaction(SIGXCPU, &sa, NULL);
}

int wo_release_sigxfsz () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
    sa.sa_handler = SIG_DFL;
    return sigaction(SIGXFSZ, &sa, NULL);
}

```

5.3 C wrapper for printf

The `printf` family of functions is implemented in C with an undefined number of arguments. This is not supported by the `bind(C)` interface. We therefore write wrappers for the versions of `sprintf` that we will actually use.

This is used by the `formats` module.

```
(sprintf_interface.c)≡
/*
  <File header>
*/
#include <stdio.h>

int sprintf_none(char* str, const char* format) {
  return sprintf(str, format);
}

int sprintf_int(char* str, const char* format, int val) {
  return sprintf(str, format, val);
}

int sprintf_double(char* str, const char* format, double val) {
  return sprintf(str, format, val);
}

int sprintf_str(char* str, const char* format, const char* val) {
  return sprintf(str, format, val);
}

(sprintf interfaces)≡
interface
  function sprintf_none (str, fmt) result (stat) bind(C)
    use iso_c_binding !NODEP!
    integer(c_int) :: stat
    character(c_char), dimension(*), intent(inout) :: str
    character(c_char), dimension(*), intent(in) :: fmt
  end function sprintf_none
end interface

interface
  function sprintf_int (str, fmt, val) result (stat) bind(C)
    use iso_c_binding !NODEP!
    integer(c_int) :: stat
    character(c_char), dimension(*), intent(inout) :: str
    character(c_char), dimension(*), intent(in) :: fmt
    integer(c_int), value :: val
  end function sprintf_int
end interface

interface
  function sprintf_double (str, fmt, val) result (stat) bind(C)
    use iso_c_binding !NODEP!
    integer(c_int) :: stat
    character(c_char), dimension(*), intent(inout) :: str
```

```

        character(c_char), dimension(*), intent(in) :: fmt
        real(c_double), value :: val
    end function sprintf_double
end interface

interface
    function sprintf_str(str, fmt, val) result (stat) bind(C)
        use iso_c_binding !NODEP!
        integer(c_int) :: stat
        character(c_char), dimension(*), intent(inout) :: str
        character(c_char), dimension(*), intent(in) :: fmt
        character(c_char), dimension(*), intent(in) :: val
    end function sprintf_str
end interface

```

5.4 Error, Message and Signal Handling

We are not so ambitious as to do proper exception handling in WHIZARD, but at least it may be useful to have a common interface for diagnostics: Results, messages, warnings, and such. As module variables we keep a buffer where the current message may be written to and a level indicator which tells which messages should be written on screen and which ones should be skipped. Alternatively, a string may be directly supplied to the message routine: this overrides the buffer, avoiding the necessity of formatted I/O in trivial cases.

(diagnostics.f90)≡

⟨File header⟩

module diagnostics

```

    use, intrinsic :: iso_c_binding !NODEP!
    use, intrinsic :: iso_fortran_env, only: output_unit !NODEP!

```

⟨Use kinds⟩

⟨Use strings⟩

```

    use io_units

```

```

    use system_dependencies

```

```

    use system_defs, only: BUFFER_SIZE, MAX_ERRORS

```

⟨Standard module head⟩

⟨Diagnostics: public⟩

⟨Diagnostics: parameters⟩

⟨Diagnostics: types⟩

⟨Diagnostics: variables⟩

⟨Diagnostics: interfaces⟩

contains

<Diagnostics: procedures>

end module diagnostics

Diagnostics levels:

```
<Diagnostics: parameters>≡  
  integer, parameter :: &  
    & TERMINATE=-2, BUG=-1, &  
    & FATAL=1, ERROR=2, WARNING=3, MESSAGE=4, RESULT=5, DEBUG=6
```

```
<Diagnostics: variables>≡  
  integer, save :: msg_level = RESULT
```

Mask fatal errors so that are treated as normal errors. Useful for interactive mode.

```
<Diagnostics: public>≡  
  public :: mask_fatal_errors
```

```
<Diagnostics: variables>+≡  
  logical, save :: mask_fatal_errors = .false.
```

How to handle bugs and unmasked fatal errors. Either execute a normal stop statement, or call the C `exit()` function, or try to cause a program crash by dereferencing a null pointer.

```
<Diagnostics: parameters>+≡  
  integer, parameter :: TERM_STOP = 0, TERM_EXIT = 1, TERM_CRASH = 2  
  
<Diagnostics: variables>+≡  
  integer, save :: handle_fatal_errors = TERM_EXIT
```

Keep track of errors. This might be used for exception handling, later. The counter is incremented only for screen messages, to avoid double counting.

```
<Diagnostics: public>+≡  
  public :: msg_count  
  
<Diagnostics: variables>+≡  
  integer, dimension(TERMINATE:DEBUG), save :: msg_count = 0
```

Keep a list of all errors and warnings. Since we do not know the number of entries beforehand, we use a linked list.

```
<Diagnostics: types>≡  
  type :: string_list  
    character(len=BUFFER_SIZE) :: string  
    type(string_list), pointer :: next  
  end type string_list  
  type :: string_list_pointer  
    type(string_list), pointer :: first, last  
  end type string_list_pointer  
  
<Diagnostics: variables>+≡  
  type(string_list_pointer), dimension(TERMINATE:WARNING), save :: &  
    & msg_list = string_list_pointer (null(), null())
```

Add the current message buffer contents to the internal list.

```

<Diagnostics: procedures>≡
subroutine msg_add (level)
  integer, intent(in) :: level
  type(string_list), pointer :: message
  select case (level)
  case (TERMINATE:WARNING)
    allocate (message)
    message%string = msg_buffer
    nullify (message%next)
    if (.not.associated (msg_list(level)%first)) &
      & msg_list(level)%first => message
    if (associated (msg_list(level)%last)) &
      & msg_list(level)%last%next => message
    msg_list(level)%last => message
    msg_count(level) = msg_count(level) + 1
  end select
end subroutine msg_add

```

Initialization:

```

<Diagnostics: public>+≡
public :: msg_list_clear

<Diagnostics: procedures>+≡
subroutine msg_list_clear
  integer :: level
  type(string_list), pointer :: message
  do level = TERMINATE, WARNING
    do while (associated (msg_list(level)%first))
      message => msg_list(level)%first
      msg_list(level)%first => message%next
      deallocate (message)
    end do
    nullify (msg_list(level)%last)
  end do
  msg_count = 0
end subroutine msg_list_clear

```

Display the summary of errors and warnings (no need to count fatals...)

```

<Diagnostics: public>+≡
public :: msg_summary

<Diagnostics: procedures>+≡
subroutine msg_summary (unit)
  integer, intent(in), optional :: unit
  call expect_summary (unit)
1  format (A,1x,I2,1x,A,I2,1x,A)
  if (msg_count(ERROR) > 0 .and. msg_count(WARNING) > 0) then
    write (msg_buffer, 1) "There were", &
      & msg_count(ERROR), "error(s) and ", &
      & msg_count(WARNING), "warning(s). "
    call msg_message (unit=unit)
  else if (msg_count(ERROR) > 0) then
    write (msg_buffer, 1) "There were", &

```

```

        & msg_count(ERROR), "error(s) and no warnings."
    call msg_message (unit=unit)
else if (msg_count(WARNING) > 0) then
    write (msg_buffer, 1) "There were no errors and ", &
        & msg_count(WARNING), "warning(s)."
    call msg_message (unit=unit)
end if
end subroutine msg_summary

```

Print the list of all messages of a given level.

<Diagnostics: public>+≡

```
public :: msg_listing
```

<Diagnostics: procedures>+≡

```

subroutine msg_listing (level, unit, prefix)
    integer, intent(in) :: level
    integer, intent(in), optional :: unit
    character(len=*), intent(in), optional :: prefix
    type(string_list), pointer :: message
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    if (present (unit)) u = unit
    message => msg_list(level)%first
    do while (associated (message))
        if (present (prefix)) then
            write (u, "(A)") prefix // trim (message%string)
        else
            write (u, "(A)") trim (message%string)
        end if
        message => message%next
    end do
    flush (u)
end subroutine msg_listing

```

The message buffer:

<Diagnostics: public>+≡

```
public :: msg_buffer
```

<Diagnostics: variables>+≡

```
character(len=BUFFER_SIZE), save :: msg_buffer = " "
```

After a message is issued, the buffer should be cleared:

<Diagnostics: procedures>+≡

```

subroutine buffer_clear
    msg_buffer = " "
end subroutine buffer_clear

```

The generic handler for messages. If the unit is omitted (or = 6), the message is written to standard output if the precedence is sufficiently high (as determined by the value of `msg_level`). If the string is omitted, the buffer is used. In any case, the buffer is cleared after printing. In accordance with FORTRAN custom, the first column in the output is left blank. For messages and warnings,

an additional exclamation mark and a blank is prepended. Furthermore, each message is appended to the internal message list (without prepending anything).

(Diagnostics: procedures)+≡

    end subroutine pacify_complex_default

```

5.4.4 Signal handling

Killing the program by external signals may leave the files written by it in an undefined state. This can be avoided by catching signals and deferring program termination. Instead of masking only critical sections, we choose to mask signals globally (done in the main program) and terminate the program at predefined checkpoints only. Checkpoints are after each command, within the sampling function (so the program can be terminated after each event), and after each iteration in the phase-space generation algorithm.

Signal handling is done via a C interface to the `sigaction` system call. When a signal is raised that has been masked by the handler, the corresponding variable is set to the value of the signal. The variables are visible from the C signal handler.

The signal `SIGINT` is for keyboard interrupt (ctrl-C), `SIGTERM` is for system interrupt, e.g., at shutdown. The `SIGXCPU` and `SIGXFSZ` signals may be issued by batch systems.

<Diagnostics: public>+≡

```

    public :: wo_sigint
    public :: wo_sigterm
    public :: wo_sigxcpu
    public :: wo_sigxfsz

```

<Diagnostics: variables>+≡

```

    integer(c_int), bind(C), volatile :: wo_sigint = 0
    integer(c_int), bind(C), volatile :: wo_sigterm = 0
    integer(c_int), bind(C), volatile :: wo_sigxcpu = 0
    integer(c_int), bind(C), volatile :: wo_sigxfsz = 0

```

Here are the interfaces to the C functions. The routine `mask_term_signals` forces termination signals to be delayed. `release_term_signals` restores normal behavior. However, the program can be terminated anytime by calling `terminate_now_if_signal` which inspects the signals and terminates the program if requested..

```

<Diagnostics: public>+≡
    public :: mask_term_signals

<Diagnostics: procedures>+≡
    subroutine mask_term_signals ()
        integer(c_int) :: status
        logical :: ok

5.5 Operating-system interface

For specific purposes, we need direct access to the OS (system calls). This is, of course, system dependent. The current version is valid for GNU/Linux; we expect to use a preprocessor for this module if different OSs are to be supported.

The current implementation lacks error handling.

```

<os_interface.f90>≡
  <File header>

  module os_interface

    use, intrinsic :: iso_c_binding !NODEP!

    <Use strings>
    use io_units
    use unit_tests
    use diagnostics
    use system_defs, only: DLERROR_LEN, ENVVAR_LEN
    use system_dependencies

    <Standard module head>

    <OS interface: public>

    <OS interface: types>

    <OS interface: interfaces>

    contains

    <OS interface: procedures>

    <OS interface: tests>

  end module os_interface

```

5.5.1 Path variables

This is a transparent container for storing user-defined path variables.

```

<OS interface: public>≡
    public :: paths_t

<OS interface: types>≡
    type :: paths_t
        type(string_t) :: prefix
        type(string_t) :: exec_prefix
        type(string_t) :: bindir
        type(string_t) :: libdir
        type(string_t) :: includedir
        type(string_t) :: datarootdir
        type(string_t) :: localprefix
        type(string_t) :: libtool
        type(string_t) :: lhapdfdir
    end type paths_t

Replace occurrences of GNU path variables (such as `${prefix}`) by their values. Do this for all strings that could depend on them, and do the replacement in reverse order, since the path variables may be defined in terms of each other.

```

5.5.3 Dynamic linking

We define a type that holds the filehandle for a dynamically linked library (shared object), together with functions to open and close the library, and to access functions in this library.

```

<OS interface: public>+≡
    public :: dlaccess_t

<OS interface: types>+≡
    type :: dlaccess_t
    private
    type(string_t) :: filename
    type(c_ptr) :: handle = c_null_ptr
    logical :: is_open = .false.
    logical :: has_error = .false.
    type(string_t) :: error
    contains
    <OS interface: dlaccess: TBP>
end type dlaccess_t

```

Output. This is called by the output routine for the process library.

```

<OS interface: dlaccess: TBP>≡
    procedure :: write => dlaccess_write

<OS interface: procedures>+≡
    subroutine dlaccess_write (object, unit)
    class(dlaccess_t), intent(in) :: object
    integer, intent(in) :: unit
    write (unit, "(1x,A)") "DL access info:"
    write (unit, "(3x,A,L1)") "is open   = ", object%is_open
    if (object%has_error) then
        write (unit, "(3x,A,A,A)") "error      = '", char (object%error), "'"
    else

```

```

        write (unit, "(3x,A)")      "error      = [none]"
    end if
end subroutine dlaccess_write

```

The interface to the library functions:

<OS interface: interfaces>≡

```

interface
    function dlopen (filename, flag) result (handle) bind(C)
        import
        character(c_char), dimension(*) :: filename
        integer(c_int), value :: flag
        type(c_ptr) :: handle
    end function dlopen
end interface

interface
    function dlclose (handle) result (status) bind(C)
        import
        type(c_ptr), value :: handle
        integer(c_int) :: status
    end function dlclose
end interface

interface
    function dlerror () result (str) bind(C)
        import
        type(c_ptr) :: str
    end function dlerror
end interface

interface
    function dlsym (handle, symbol) result (fp_ptr) bind(C)
        import
        type(c_ptr), value :: handle
        character(c_char), dimension(*) :: symbol
        type(c_funptr) :: fp_ptr
    end function dlsym
end interface

```

This reads an error string and transforms it into a `string_t` object, if an error has occurred. If not, set the error flag to false and return an empty string.

<System defs: public parameters>+≡

```

integer, parameter, public :: DLERROR_LEN = 160

```

<OS interface: procedures>+≡

```

subroutine read_dlerror (has_error, error)
    logical, intent(out) :: has_error
    type(string_t), intent(out) :: error
    type(c_ptr) :: err_cptr
    character(len=DLERROR_LEN, kind=c_char), pointer :: err_fp_ptr
    integer :: str_end
    err_cptr = dlerror ()
    if (c_associated (err_cptr)) then

```

```

        call c_f_pointer (err_cptra, err_fptr)
        has_error = .true.
        str_end = scan (err_fptr, c_null_char)
        if (str_end > 0) then
            error = err_fptr(1:str_end-1)
        else
            error = err_fptr
        end if
    else
        has_error = .false.
        error = ""
    end if
end subroutine read_dlerror

```

This is the Fortran API. Init/final open and close the file, i.e., load and unload the library.

Note that a library can be opened more than once, and that for an ultimate close as many `dlclose` calls as `dlopen` calls are necessary. However, we assume that it is opened and closed only once.

```

<OS interface: public>+≡
    public :: dlaccess_init
    public :: dlaccess_final

<OS interface: dlaccess: TBP>+≡
    procedure :: init => dlaccess_init
    procedure :: final => dlaccess_final

<OS interface: procedures>+≡
    subroutine dlaccess_init (dlaccess, prefix, libname, os_data)
        class(dlaccess_t), intent(out) :: dlaccess
        type(string_t), intent(in) :: prefix, libname
        type(os_data_t), intent(in), optional :: os_data
        type(string_t) :: filename
        logical :: exist
        dlaccess%filename = libname
        filename = prefix // "/" // libname
        inquire (file=char(filename), exist=exist)
        if (.not. exist) then
            filename = prefix // ".libs/" // libname
            inquire (file=char(filename), exist=exist)
            if (.not. exist) then
                dlaccess%has_error = .true.
                dlaccess%error = "Library '" // filename // "' not found"
                return
            end if
        end if
        dlaccess%handle = dlopen (char (filename) // c_null_char, ior ( &
            RTLD_LAZY, RTLD_LOCAL))
        dlaccess%is_open = c_associated (dlaccess%handle)
        call read_dlerror (dlaccess%has_error, dlaccess%error)
    end subroutine dlaccess_init

    subroutine dlaccess_final (dlaccess)
        class(dlaccess_t), intent(inout) :: dlaccess

```

```

integer(c_int) :: status
if (dlaccess%is_open) then
    status = dlclose (dlaccess%handle)
    dlaccess%is_open = .false.
    call read_dlerror (dlaccess%has_error, dlaccess%error)
end if
end subroutine dlaccess_final

```

Return true if an error has occurred.

```

<OS interface: public>+≡
    public :: dlaccess_has_error

<OS interface: procedures>+≡
    function dlaccess_has_error (dlaccess) result (flag)
        logical :: flag
        type(dlaccess_t), intent(in) :: dlaccess
        flag = dlaccess%has_error
    end function dlaccess_has_error

```

Return the error string currently stored in the `dlaccess` object.

```

<OS interface: public>+≡
    public :: dlaccess_get_error

<OS interface: procedures>+≡
    function dlaccess_get_error (dlaccess) result (error)
        type(string_t) :: error
        type(dlaccess_t), intent(in) :: dlaccess
        error = dlaccess%error
    end function dlaccess_get_error

```

The symbol handler returns the C address of the function with the given string name. (It is a good idea to use `bind(C)` for all functions accessed by this, such that the name string is well-defined.) Call `c_f_procpointer` to cast this into a Fortran procedure pointer with an appropriate interface.

```

<OS interface: public>+≡
    public :: dlaccess_get_c_funptr

<OS interface: procedures>+≡
    function dlaccess_get_c_funptr (dlaccess, fname) result (fptr)
        type(c_funptr) :: fptr
        type(dlaccess_t), intent(inout) :: dlaccess
        type(string_t), intent(in) :: fname
        fptr = dlsym (dlaccess%handle, char (fname) // c_null_char)
        call read_dlerror (dlaccess%has_error, dlaccess%error)
    end function dlaccess_get_c_funptr

```

5.5.4 Predicates

Return true if the library is loaded. In particular, this is false if loading was unsuccessful.

```

<OS interface: public>+≡
    public :: dlaccess_is_open

```

```

<OS interface: procedures>+≡
  function dlaccess_is_open (dlaccess) result (flag)
    logical :: flag
    type(dlaccess_t), intent(in) :: dlaccess
    flag = dlaccess%is_open
  end function dlaccess_is_open

```

5.5.5 Shell access

This is the standard system call for executing a shell command, such as invoking a compiler.

In F2008 there will be the equivalent built-in command `execute_command_line`.

```

<OS interface: public>+≡
  public :: os_system_call

<OS interface: procedures>+≡
  subroutine os_system_call (command_string, status, verbose)
    type(string_t), intent(in) :: command_string
    integer, intent(out), optional :: status
    logical, intent(in), optional :: verbose
    logical :: verb
    integer :: stat
    verb = .false.; if (present (verbose)) verb = verbose
    if (verb) &
      call msg_message ("command: " // char (command_string))
    stat = system (char (command_string) // c_null_char)
    if (present (status)) then
      status = stat
    else if (stat /= 0) then
      if (.not. verb) &
        call msg_message ("command: " // char (command_string))
      write (msg_buffer, "(A,I0)") "Return code = ", stat
      call msg_message ()
      call msg_fatal ("System command returned with nonzero status code")
    end if
  end subroutine os_system_call

<OS interface: interfaces>+≡
  interface
    function system (command) result (status) bind(C)
      import
      integer(c_int) :: status
      character(c_char), dimension(*) :: command
    end function system
  end interface

```

5.5.6 Querying for a directory

This queries for the existence of a directory. There is no standard way to achieve this in FORTRAN, and if we were to call into `libc`, we would need access to C

macros for evaluating the result, so we resort to calling `test` as a system call.

```

<OS interface: public>+≡
    public :: os_dir_exist

<OS interface: procedures>+≡
    function os_dir_exist (name) result (res)
        type(string_t), intent(in) :: name
        logical :: res
        integer :: status
        call os_system_call ('test -d "' // name // '"', status=status)
        res = status == 0
    end function os_dir_exist

<OS interface: public>+≡
    public :: os_file_exist

<OS interface: procedures>+≡
    function os_file_exist (name) result (exist)
        type(string_t), intent(in) :: name
        !    logical, intent(in), optional :: verb
        logical :: exist
        !    integer :: status
        !    call os_system_call ('test -f "' // name // '"', status=status, verbose=verb)
        !    res = (status == 0)
        inquire (file = char (name), exist=exist)
    end function os_file_exist

```

5.5.7 Fortran compiler and linker

Compile a single module for use in a shared library, but without linking.

```

<OS interface: public>+≡
    public :: os_compile_shared

<OS interface: procedures>+≡
    subroutine os_compile_shared (src, os_data, status)
        type(string_t), intent(in) :: src
        type(os_data_t), intent(in) :: os_data
        integer, intent(out), optional :: status

5.5.8 Controlling OpenMP

OpenMP is handled automatically by the library for the most part. Here is a convenience routine for setting the number of threads, with some diagnostics.

<OS interface: public>+≡

```
public :: openmp_set_num_threads_verbose
```

<OS interface: procedures>+≡

```

subroutine openmp_set_num_threads_verbose (num_threads, openmp_logging)
  integer, intent(in) :: num_threads
  integer :: n_threads
  logical, intent(in), optional :: openmp_logging
  logical :: logging
  if (present (openmp_logging)) then
    logging = openmp_logging
  else

```

```

        logging = .true.
    end if
    n_threads = num_threads
    if (openmp_is_active ()) then
        if (num_threads == 1) then
            if (logging) then
                write (msg_buffer, "(A,I0,A)") "OpenMP: Using ", num_threads, &
                    " thread"
                call msg_message
            end if
            n_threads = num_threads
        else if (num_threads > 1) then
            if (logging) then
                write (msg_buffer, "(A,I0,A)") "OpenMP: Using ", num_threads, &
                    " threads"
                call msg_message
            end if
            n_threads = num_threads
        else
            if (logging) then
                write (msg_buffer, "(A,I0,A)") "OpenMP: " &
                    // "Illegal value of openmp_num_threads (", num_threads, &
                    ") ignored"
                call msg_error
            end if
            n_threads = openmp_get_default_max_threads ()
            if (logging) then
                write (msg_buffer, "(A,I0,A)") "OpenMP: Using ", &

5.6 Interface for formatted I/O

For access to formatted printing (possibly input), we interface the C `printf` family of functions. There are two important issues here:

1. `printf` takes an arbitrary number of arguments, relying on the C stack. This is not interoperable. We interface it with C wrappers that output a single integer, real or string and restrict the allowed formats accordingly.
2. Restricting format strings is essential also for preventing format string attacks. Allowing arbitrary format string would create a real security hole

in a Fortran program.

3. The string returned by `sprintf` must be allocated to the right size.

5.6.1 Parsing a C format string

The C format string contains characters and format conversion specifications. The latter are initiated by a % sign. If the next letter is also a %, a percent sign is printed and no conversion is done. Otherwise, a conversion is done and applied to the next argument in the argument list. First comes an optional flag (#, 0, -, +, or space), an optional field width (decimal digits starting not with zero), an optional precision (period, then another decimal digit string), a length modifier (irrelevant for us, therefore not supported), and a conversion specifier: **d** or **i** for integer; **e**, **f**, **g** (also upper case) for double-precision real, **s** for a string.

We explicitly exclude all other conversion specifiers, and we check the specifiers against the actual arguments.

A type for passing arguments

This is a polymorphic type that can hold integer, real (double), and string arguments.

$\langle \text{Formats: parameters} \rangle \equiv$

```

integer, parameter :: ARGTYPE_NONE = 0
integer, parameter :: ARGTYPE_LOG = 1
integer, parameter :: ARGTYPE_INT = 2
integer, parameter :: ARGTYPE_REAL = 3
integer, parameter :: ARGTYPE_STR = 4

```

The integer and real entries are actually scalars, but we avoid relying on the allocatable-scalar feature and make them one-entry arrays. The character entry is a real array which is a copy of the string.

Logical values are mapped to strings (true or false), so this type parameter value is mostly unused.

        write (msg_buffer, *) "Output: '", result, "'"
        call msg_message ()
        call msg_error ("I/O error in sprintf call")
        actual_length = 0
    end if
end subroutine sprintf_arg_apply_printf

```

Container type for the output

There is a procedure which chops the format string into pieces that contain at most one conversion specifier. Pairing this with a `sprintf_arg` object, we get the actual input to the `sprintf` interface. The type below holds this input and can allocate the output string.

(Formats: types)+≡

```

type :: sprintf_interface_t
    private
    character(c_char), dimension(:), allocatable :: input_fmt
    type(sprintf_arg_t) :: arg
    character(c_char), dimension(:), allocatable :: output_str

```

```

integer :: output_str_len = 0
end type sprintf_interface_t

```

<Formats: procedures>+≡

```

subroutine sprintf_interface_init (intf, fmt, arg)
  type(sprintf_interface_t), intent(out) :: intf
  type(string_t), intent(in) :: fmt
  type(sprintf_arg_t), intent(in) :: arg
  integer :: fmt_len, i
  fmt_len = len (fmt)
  allocate (intf%input_fmt (fmt_len + 1))
  do i = 1, fmt_len
    intf%input_fmt(i) = extract (fmt, i, i)
  end do
  intf%input_fmt(fmt_len+1) = c_null_char
  intf%arg = arg
  allocate (intf%output_str (len (fmt) + sprintf_arg_get_length (arg) + 1))
end subroutine sprintf_interface_init

```

<Formats: procedures>+≡

```

subroutine sprintf_interface_write (intf, unit)
  type(sprintf_interface_t), intent(in) :: intf
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u, *) "Format string = ", "'", intf%input_fmt, "'"
  write (u, "(1x,A,1x)", advance = "no") "Argument = "
  call sprintf_arg_write (intf%arg, unit)
  if (intf%output_str_len > 0) then
    write (u, *) "Result string = ", &
      "'", intf%output_str (1:intf%output_str_len), "'"
  end if
end subroutine sprintf_interface_write

```

Return the output string:

<Formats: procedures>+≡

```

function sprintf_interface_get_result (intf) result (string)
  type(string_t) :: string
  type(sprintf_interface_t), intent(in) :: intf
  character(kind = c_char, len = max (intf%output_str_len, 0)) :: buffer
  integer :: i
  if (intf%output_str_len > 0) then
    do i = 1, intf%output_str_len
      buffer(i:i) = intf%output_str(i)
    end do
    string = buffer(1:intf%output_str_len)
  else
    string = ""
  end if
end function sprintf_interface_get_result

```

<Formats: procedures>+≡

```

subroutine sprintf_interface_apply_sprintf (intf)
  type(sprintf_interface_t), intent(inout) :: intf
  call sprintf_arg_apply_sprintf &
    (intf%arg, intf%input_fmt, intf%output_str, intf%output_str_len)
end subroutine sprintf_interface_apply_sprintf

```

Import the interfaces defined in the previous section:

```

<Formats: interfaces>+≡
  <sprintf interfaces>

```

Scan the format string

Chop it into pieces that contain one conversion specifier each. The zero-th piece contains the part before the first specifier. Check the specifiers and allow only the subset that we support. Also check for an exact match between conversion specifiers and input arguments. The result is an allocated array of `sprintf_interface` object; each one contains a piece of the format string and the corresponding argument.

```

<Formats: procedures>+≡
subroutine chop_and_check_format_string (fmt, arg, intf)

5.7 CPU timing

The time is stored in a simple derived type which just holds a floating-point number.

```

<cputime.f90>≡
  <File header>

  module cputime

    <Use kinds>
    use io_units
    <Use strings>
    use unit_tests
    use diagnostics

    <Standard module head>

    <CPU time: public>

    <CPU time: types>

    <CPU time: interfaces>

    contains

    <CPU time: procedures>

    <CPU time: tests>

  end module cputime

```

The CPU time is a floating-point number with an arbitrary reference time. It is single precision (default real, not `real(default)`). It is measured in seconds.

```

<CPU time: public>≡
  public :: time_t

<CPU time: types>≡
  type :: time_t
  private

```

```

        logical :: known = .false.
        real :: value = 0
contains
    <CPU time: time: TBP>
end type time_t

<CPU time: time: TBP>≡
    procedure :: write => time_write

<CPU time: procedures>≡
    subroutine time_write (object, unit)
        class(time_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        write (u, "(1x,A)", advance="no") "Time in seconds ="
        if (object%known) then
            write (u, "(1x,ES10.3)") object%value

```

5.7.1 Timer

A timer can measure real (wallclock) time differences. The base type corresponds to the result, i.e., time difference. The object contains two further times for start and stop time.

```

<CPU time: public>+≡
    public :: timer_t

<CPU time: types>+≡
    type, extends (time_t) :: timer_t
    private
        logical :: running = .false.
        type(time_t) :: t1, t2
    contains
        <CPU time: timer: TBP>
    end type timer_t

```

Output. If the timer is running, we indicate this, otherwise write just the result.

```

<CPU time: timer: TBP>≡
    procedure :: write => timer_write

<CPU time: procedures>+≡
    subroutine timer_write (object, unit)
        class(timer_t), intent(in) :: object
        integer, intent(in), optional :: unit
    end subroutine timer_write

```

```

integer :: u
u = given_output_unit (unit)
if (object%running) then
    write (u, "(1x,A)") "Time in seconds = [running]"
else
    call object%time_t%write (u)
end if
end subroutine timer_write

```

Start the timer: store the current time in the first entry and adapt the status.
We forget any previous values.

```

⟨CPU time: timer: TBP⟩+≡
    procedure :: start => timer_start

⟨CPU time: procedures⟩+≡
    subroutine timer_start (timer)
        class(timer_t), intent(out) :: timer
        call timer%t1%set_current ()
        timer%running = .true.
    end subroutine timer_start

```

Restart the timer: simply adapt the status, keeping the start time.

```

⟨CPU time: timer: TBP⟩+≡
    procedure :: restart => timer_restart

⟨CPU time: procedures⟩+≡
    subroutine timer_restart (timer)
        class(timer_t), intent(inout) :: timer
        if (timer%t1%known .and. .not. timer%running) then
            timer%running = .true.
        else
            call msg_bug ("Timer: restart attempt from wrong status")
        end if
    end subroutine timer_restart

```

Stop the timer: store the current time in the second entry, adapt the status,
and compute the elapsed time.

```

⟨CPU time: timer: TBP⟩+≡
    procedure :: stop => timer_stop

⟨CPU time: procedures⟩+≡
    subroutine timer_stop (timer)
        class(timer_t), intent(inout) :: timer
        call timer%t2%set_current ()
        timer%running = .false.
        call timer%evaluate ()
    end subroutine timer_stop

```

This is separate, available for the unit test.

```

⟨CPU time: timer: TBP⟩+≡
    procedure, private :: evaluate => timer_evaluate

```

```

<CPU time: procedures>+≡
  subroutine timer_evaluate (timer)
    class(timer_t), intent(inout) :: timer
    timer%time_t = timer%t2 - timer%t1
  end subroutine timer_evaluate

```

5.7.2 Unit tests

```

<CPU time: public>+≡
  public :: cputime_test

<CPU time: tests>≡
  subroutine cputime_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <CPU time: execute tests>
  end subroutine cputime_test

```

Basic tests

Check basic functions of the time object. The part which we can't check is getting the actual time from the system clock, since the output will not be reproducible. However, we can check time formats and operations.

```

<CPU time: execute tests>≡
  call test (cputime_1, "cputime_1", &
    "time operations", &
    u, results)

<CPU time: tests>+≡
  subroutine cputime_1 (u)
    integer, intent(in) :: u
    type(time_t) :: time, time1, time2
    real :: t
    integer :: d, h, m, s

    write (u, "(A)")  "* Test output: cputime_1"
    write (u, "(A)")  "* Purpose: check time operations"
    write (u, "(A)")

write (u, *)
write (u, "(A)") "* Test output end: cputime_2"

end subroutine cputime_2

```

Chapter 6

Combinatorics

These modules implement standard algorithms (sorting, hashing, etc.) that are not available in Fortran.

Fortran doesn't support generic programming, therefore the algorithms are implemented only for specific data types.

bytes Derived types for bytes and words.

hashes Types and tools for setting up hashtables.

md5 The MD5 algorithm for message digest.

permutations Permuting an array of integers.

sorting Sorting integer and real values.

6.1 Bytes and such

In a few instances we will need the notion of a byte (8-bit) and a word (32 bit), even a 64-bit word. A block of 512 bit is also needed (for MD5).

We rely on integers up to 64 bit being supported by the processor. The main difference to standard integers is the interpretation as unsigned integers.

*<bytes.f90>≡
<File header>*

```
module bytes
```

```
    use kinds, only: i8, i32, i64  
    use io_units
```

<Standard module head>

<Bytes: public>

<Bytes: types>

<Bytes: parameters>

```
⟨Bytes: interfaces⟩
```

```
contains
```

```
⟨Bytes: procedures⟩
```

```
end module bytes
```

6.1.1 8-bit words: bytes

This is essentially a wrapper around 8-bit integers. The wrapper emphasises their special interpretation as a sequence of bits. However, we interpret bytes as unsigned integers.

```
⟨Bytes: public⟩≡
```

```
public :: byte_t
```

```
⟨Bytes: types⟩≡
```

```
type :: byte_t
```

```
private
```

```
integer(i8) :: i
```

```
end type byte_t
```

```
⟨Bytes: public⟩+≡
```

```
public :: byte_zero
```

```
⟨Bytes: parameters⟩≡
```

```
type(byte_t), parameter :: byte_zero = byte_t (0_i8)
```

Set a byte from 8-bit integer:

```
⟨Bytes: public⟩+≡
```

```
public :: assignment(=)
```

```
⟨Bytes: interfaces⟩≡
```

```
interface assignment(=)
```

```
module procedure set_byte_from_i8
```

```
end interface
```

```
⟨Bytes: procedures⟩≡
```

```
subroutine set_byte_from_i8 (b, i)
```

```
type(byte_t), intent(out) :: b
```

```
integer(i8), intent(in) :: i
```

```
b%i = i
```

```
end subroutine set_byte_from_i8
```

Write a byte in one of two formats: either as a hexadecimal number (two digits, default) or as a decimal number (one to three digits). The decimal version is nontrivial because bytes are unsigned integers. Optionally append a newline.

```
⟨Bytes: public⟩+≡
```

```
public :: byte_write
```

```
⟨Bytes: interfaces⟩+≡
```

```
interface byte_write
```

```
module procedure byte_write_unit, byte_write_string
```

```
end interface
```

```

<Bytes: procedures>+≡
subroutine byte_write_unit (b, unit, decimal, newline)
  type(byte_t), intent(in), optional :: b
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: decimal, newline
  logical :: dc, nl
  type(word32_t) :: w
  integer :: u
  u = given_output_unit (unit); if (u < 0) return
  dc = .false.; if (present (decimal)) dc = decimal
  nl = .false.; if (present (newline)) nl = newline
  if (dc) then
    w = b
    write (u, '(I3)', advance='no') w%i
  else
    write (u, '(z2.2)', advance='no') b%i
  end if
  if (nl) write (u, *)
end subroutine byte_write_unit

```

The string version is hex-only

```

<Bytes: procedures>+≡
subroutine byte_write_string (b, s)
  type(byte_t), intent(in) :: b
  character(len=2), intent(inout) :: s
  write (s, '(z2.2)') b%i
end subroutine byte_write_string

```

6.1.2 32-bit words

This is not exactly a 32-bit integer. A word is to be filled with bytes, and it may be partially filled. The filling is done lowest-byte first, highest-byte last. We count the bits, so fill should be either 0, 8, 16, 24, or 32. In printing words, we correspondingly distinguish between printing zeros and printing blanks.

```

<Bytes: public>+≡
public :: word32_t

<Bytes: types>+≡
type :: word32_t
  private
  integer(i32) :: i
  integer :: fill = 0
end type word32_t

```

Assignment: the word is filled by inserting a 32-bit integer

```

<Bytes: interfaces>+≡
interface assignment(=)
  module procedure word32_set_from_i32
  module procedure word32_set_from_byte
end interface

```

```

<Bytes: procedures>+≡
  subroutine word32_set_from_i32 (w, i)
    type(word32_t), intent(out) :: w
    integer(i32), intent(in) :: i
    w%i = i
    w%fill = 32
  end subroutine word32_set_from_i32

```

Reverse assignment to a 32-bit integer. We do not check the fill status.

```

<Bytes: interfaces>+≡
  interface assignment(=)
    module procedure i32_from_word32
  end interface

<Bytes: procedures>+≡
  subroutine i32_from_word32 (i, w)
    integer(i32), intent(out) :: i
    type(word32_t), intent(in) :: w
    i = w%i
  end subroutine i32_from_word32

```

Filling with a 8-bit integer is slightly tricky, because in this interpretation integers are unsigned.

```

<Bytes: procedures>+≡
  subroutine word32_set_from_byte (w, b)
    type(word32_t), intent(out) :: w
    type(byte_t), intent(in) :: b
    if (b%i >= 0_i8) then
      w%i = b%i
    else
      w%i = 2_i32*(huge(0_i8)+1_i32) + b%i
    end if
    w%fill = 32
  end subroutine word32_set_from_byte

```

Check the fill status

```

<Bytes: public>+≡
  public :: word32_empty, word32_filled, word32_fill

<Bytes: procedures>+≡
  function word32_empty (w)
    type(word32_t), intent(in) :: w
    logical :: word32_empty
    word32_empty = (w%fill == 0)
  end function word32_empty

  function word32_filled (w)
    type(word32_t), intent(in) :: w
    logical :: word32_filled
    word32_filled = (w%fill == 32)
  end function word32_filled

  function word32_fill (w)

```

```

    type(word32_t), intent(in) :: w
    integer :: word32_fill
    word32_fill = w%fill
end function word32_fill

```

Partial assignment: append a byte to a partially filled word. (Note: no assignment if the word is filled, so check this before if necessary.)

```

<Bytes: public>+≡
    public :: word32_append_byte
<Bytes: procedures>+≡
    subroutine word32_append_byte (w, b)
        type(word32_t), intent(inout) :: w
        type(byte_t), intent(in) :: b
        type(word32_t) :: w1
        if (.not. word32_filled (w)) then
            w1 = b
            call mvbits (w1%i, 0, 8, w%i, w%fill)
            w%fill = w%fill + 8
        end if
    end subroutine word32_append_byte

```

Extract a byte from a word. The argument *i* is the position, which may be 0, 1, 2, or 3.

For the final assignment, we set the highest bit separately. Otherwise, we might trigger an overflow condition for a compiler with strict checking turned on.

```

<Bytes: public>+≡
    public :: byte_from_word32
<Bytes: procedures>+≡
    function byte_from_word32 (w, i) result (b)
        type(word32_t), intent(in) :: w
        integer, intent(in) :: i
        type(byte_t) :: b
        integer(i32) :: j
        j = 0
        if (i >= 0 .and. i*8 < w%fill) then
            call mvbits (w%i, i*8, 8, j, 0)
        end if
        b%i = int (ibclr (j, 7), kind=i8)
        if (btest (j, 7)) b%i = ibset (b%i, 7)
    end function byte_from_word32

```

Write a word to file or STDOUT. We understand words as unsigned integers, therefore we cannot use the built-in routine unchanged. However, we can make use of the existence of 64-bit integers and their output routine.

In hexadecimal format, the default version prints eight hex characters, highest-first. The `bytes` version prints four bytes (two-hex characters), lowest first, with spaces in-between. The decimal bytes version is analogous. In the `bytes` version, missing bytes are printed as whitespace.

```

<Bytes: public>+≡
    public :: word32_write

```

```

<Bytes: interfaces>+≡
interface word32_write
    module procedure word32_write_unit
end interface

<Bytes: procedures>+≡
subroutine word32_write_unit (w, unit, bytes, decimal, newline)
    type(word32_t), intent(in) :: w
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: bytes, decimal, newline
    logical :: dc, by, nl
    type(word64_t) :: ww
    integer :: i, u
    u = given_output_unit (unit); if (u < 0) return
    by = .false.; if (present (bytes)) by = bytes
    dc = .false.; if (present (decimal)) dc = decimal
    nl = .false.; if (present (newline)) nl = newline
    if (by) then
        do i = 0, 3
            if (i>0) write (u, '(1x)', advance='no')
            if (8*i < w%fill) then
                call byte_write (byte_from_word32 (w, i), unit, decimal=decimal)
            else if (dc) then
                write (u, '(3x)', advance='no')
            else
                write (u, '(2x)', advance='no')
            end if
        end do
    else if (dc) then
        ww = w
        write (u, '(I10)', advance='no') ww%i
    else
        select case (w%fill)
        case ( 0)
        case ( 8); write (6, '(1x,z8.2)', advance='no') ibits (w%i, 0, 8)
        case (16); write (6, '(1x,z8.4)', advance='no') ibits (w%i, 0,16)
        case (24); write (6, '(1x,z8.6)', advance='no') ibits (w%i, 0,24)
        case (32); write (6, '(1x,z8.8)', advance='no') ibits (w%i, 0,32)
        end select
    end if
    if (nl) write (u, *)
end subroutine word32_write_unit

```

6.1.3 Operations on 32-bit words

Define the usual logical operations, as well as addition (mod 2^{32}). We assume that all operands are completely filled.

```

<Bytes: public>+≡
public :: not, ior, ieor, iand, ishft, ishftc

<Bytes: interfaces>+≡
interface not
    module procedure word_not

```

```

end interface
interface ior
    module procedure word_or
end interface

        j = int (ibclr (w1%i, 31), i64) + int (ibclr (w2%i, 31), i64)
        w3 = int (ibclr (j, 31), kind=i32)
        if (btest (j, 31)) then
            if (btest (w1%i, 31) .eqv. btest (w2%i, 31)) w3 = ibset (w3%i, 31)
        else
            if (btest (w1%i, 31) .neqv. btest (w2%i, 31)) w3 = ibset (w3%i, 31)
        end if
    end function word_add

    function word_add_i8 (w1, i) result (w3)
        type(word32_t), intent(in) :: w1
        integer(i8), intent(in) :: i
        type(word32_t) :: w3
        integer(i64) :: j
        j = int (ibclr (w1%i, 31), i64) + int (ibclr (i, 7), i64)
        if (btest (i, 7)) j = j + 128
        w3 = int (ibclr (j, 31), kind=i32)
        if (btest (j, 31) .neqv. btest (w1%i, 31)) w3 = ibset (w3%i, 31)
    end function word_add_i8

    function word_add_i32 (w1, i) result (w3)
        type(word32_t), intent(in) :: w1
        integer(i32), intent(in) :: i
        type(word32_t) :: w3
        integer(i64) :: j
        j = int (ibclr (w1%i, 31), i64) + int (ibclr (i, 31), i64)
        w3 = int (ibclr (j, 31), kind=i32)
        if (btest (j, 31)) then
            if (btest (w1%i, 31) .eqv. btest (i, 31)) w3 = ibset (w3%i, 31)
        else
            if (btest (w1%i, 31) .neqv. btest (i, 31)) w3 = ibset (w3%i, 31)
        end if
    end function word_add_i32

```

6.1.4 64-bit words

These objects consist of two 32-bit words. They thus can hold integer numbers larger than 2^{32} (to be exact, 2^{31} since FORTRAN integers are signed). The order is low-word, high-word.

```
<Bytes: public>+≡
    public :: word64_t

<Bytes: types>+≡
    type :: word64_t
    private
        integer(i64) :: i
    end type word64_t
```

Set a 64 bit word:

```
<Bytes: interfaces>+≡
    interface assignment(=)
        module procedure word64_set_from_i64
        module procedure word64_set_from_word32
    end interface

<Bytes: procedures>+≡
    subroutine word64_set_from_i64 (ww, i)
        type(word64_t), intent(out) :: ww
        integer(i64), intent(in) :: i
        ww%i = i
    end subroutine word64_set_from_i64
```

Filling with a 32-bit word:

```
<Bytes: procedures>+≡
    subroutine word64_set_from_word32 (ww, w)
        type(word64_t), intent(out) :: ww
        type(word32_t), intent(in) :: w
        if (w%i >= 0_i32) then
            ww%i = w%i
        else
            ww%i = 2_i64*(huge(0_i32)+1_i64) + w%i
        end if
    end subroutine word64_set_from_word32
```

Extract a byte from a word. The argument *i* is the position, which may be between 0 and 7.

For the final assignment, we set the highest bit separately. Otherwise, we might trigger an overflow condition for a compiler with strict checking turned on.

```
<Bytes: public>+≡
    public :: byte_from_word64, word32_from_word64

<Bytes: procedures>+≡
    function byte_from_word64 (ww, i) result (b)
        type(word64_t), intent(in) :: ww
        integer, intent(in) :: i
        type(byte_t) :: b
```

```

integer(i64) :: j
j = 0
if (i >= 0 .and. i*8 < 64) then
    call mvbits (ww%i, i*8, 8, j, 0)
end if
b%i = int (ibclr (j, 7), kind=i8)
if (btest (j, 7)) b%i = ibset (b%i, 7)
end function byte_from_word64

```

Extract a 32-bit word from a 64-bit word. The position is either 0 or 1.

<Bytes: procedures>+≡

```

function word32_from_word64 (ww, i) result (w)
    type(word64_t), intent(in) :: ww
    integer, intent(in) :: i
    type(word32_t) :: w
    integer(i64) :: j
    j = 0
    select case (i)
    case (0); call mvbits (ww%i, 0, 32, j, 0)
    case (1); call mvbits (ww%i, 32, 32, j, 0)
    end select
    w = int (ibclr (j, 31), kind=i32)
    if (btest (j, 31)) w = ibset (w%i, 31)
end function word32_from_word64

```

Print a 64-bit word. Decimal version works up to 2^{63} . The `words` version uses the 'word32' printout, separated by two spaces. The low-word is printed first. The `bytes` version also uses the 'word32' printout. This implies that the lowest byte is first. The default version prints a hexadecimal number without spaces, highest byte first.

<Bytes: public>+≡

```

public :: word64_write

```

<Bytes: interfaces>+≡

```

interface word64_write
    module procedure word64_write_unit
end interface

```

<Bytes: procedures>+≡

```

subroutine word64_write_unit (ww, unit, words, bytes, decimal, newline)
    type(word64_t), intent(in) :: ww
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: words, bytes, decimal, newline
    logical :: wo, by, dc, nl
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    wo = .false.; if (present (words)) wo = words
    by = .false.; if (present (bytes)) by = bytes
    dc = .false.; if (present (decimal)) dc = decimal
    nl = .false.; if (present (newline)) nl = newline
    if (wo .or. by) then
        call word32_write_unit (word32_from_word64 (ww, 0), unit, by, dc)
        write (u, '(2x)', advance='no')
        call word32_write_unit (word32_from_word64 (ww, 1), unit, by, dc)
    end if
end subroutine word64_write_unit

```

```

else if (dc) then
  write (u, '(I19)', advance='no') ww%i
else
  write (u, '(Z16)', advance='no') ww%i
end if
if (nl) write (u, *)
end subroutine word64_write_unit

```

6.2 Hashtables

Hash tables, like lists, are not part of Fortran and must be defined on a per-case basis. In this section we define a module that contains a hash function.

Furthermore, for reference there is a complete framework of hashtable type definitions and access functions. This code is to be replicated where hash tables are used, *mutatis mutandis*.

```

<hashes.f90>≡
  <File header>

  module hashes

    use kinds, only: i8, i32
    use bytes

    <Standard module head>

    <Hashes: public>

    contains

    <Hashes: procedures>

  end module hashes

```

6.2.1 The hash function

This is the one-at-a-time hash function by Bob Jenkins (from Wikipedia), re-implemented in Fortran. The function works on an array of bytes (8-bit integers), as could be produced by, e.g., the `transfer` function, and returns a single 32-bit integer. For determining the position in a hashtable, one can pick the lower bits of the result as appropriate to the hashtable size (which should be a power of 2). Note that we are working on signed integers, so the interpretation of values differs from the C version. This should not matter in practice, however.

```

<Hashes: public>≡
  public :: hash

<Hashes: procedures>≡
  function hash (key) result (hashval)
    integer(i32) :: hashval
    integer(i8), dimension(:), intent(in) :: key

```

```

type(word32_t) :: w
integer :: i
w = 0_i32
do i = 1, size (key)
    w = w + key(i)
    w = w + ishft (w, 10)
    w = ieor (w, ishft (w, -6))
end do
w = w + ishft (w, 3)
w = ieor (w, ishft (w, -11))
w = w + ishft (w, 15)
hashval = w
end function hash

```

6.2.2 The hash table

We define a generic hashtable type (that depends on the `hash_data_t` type) together with associated methods.

This is a template:

```

<Hashtables: types>≡
type :: hash_data_t
integer :: i
end type hash_data_t

```

Associated methods:

```

<Hashtables: procedures>≡
subroutine hash_data_final (data)
    type(hash_data_t), intent(inout) :: data
end subroutine hash_data_final

subroutine hash_data_write (data, unit)
    type(hash_data_t), intent(in) :: data
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, *) data%i
end subroutine hash_data_write

```

Each hash entry stores the unmasked hash value, the key, and points to actual data if present. Note that this could be an allocatable scalar in principle, but making it a pointer avoids deep copy when expanding the hashtable.

```

<Hashtables: types>+≡
type :: hash_entry_t
integer(i32) :: hashval = 0
integer(i8), dimension(:), allocatable :: key
type(hash_data_t), pointer :: data => null ()
end type hash_entry_t

```

The hashtable object holds the actual table, the number of filled entries and the number of entries after which the size should be doubled. The mask is equal to the table size minus one and thus coincides with the upper bound of the table index, which starts at zero.

```

<Hashtables: types>+≡
type :: hashtable_t
integer :: n_entries = 0
real :: fill_ratio = 0
integer :: n_entries_max = 0
integer(i32) :: mask = 0
type(hash_entry_t), dimension(:), allocatable :: entry
end type hashtable_t

```

Initializer: The size has to be a power of two, the fill ratio is a real (machine-default!) number between 0 and 1.

```

<Hashtables: procedures>+≡
subroutine hashtable_init (hashtable, size, fill_ratio)
type(hashtable_t), intent(out) :: hashtable
integer, intent(in) :: size
real, intent(in) :: fill_ratio
hashtable%fill_ratio = fill_ratio
hashtable%n_entries_max = size * fill_ratio
hashtable%mask = size - 1
allocate (hashtable%entry (0:hashtable%mask))
end subroutine hashtable_init

```

Finalizer: This calls a `hash_data_final` subroutine which must exist.

```

<Hashtables: procedures>+≡
subroutine hashtable_final (hashtable)
type(hashtable_t), intent(inout) :: hashtable
integer :: i
do i = 0, hashtable%mask
if (associated (hashtable%entry(i)%data)) then
call hash_data_final (hashtable%entry(i)%data)
deallocate (hashtable%entry(i)%data)
end if
end do
deallocate (hashtable%entry)
end subroutine hashtable_final

```

Output. Here, we refer to a `hash_data_write` subroutine.

```

<Hashtables: procedures>+≡
subroutine hashtable_write (hashtable, unit)
type(hashtable_t), intent(in) :: hashtable
integer, intent(in), optional :: unit
integer :: u, i
u = given_output_unit (unit); if (u < 0) return
do i = 0, hashtable%mask
if (associated (hashtable%entry(i)%data)) then
write (u, *) i, "(hash =", hashtable%entry(i)%hashval, ")", &
hashtable%entry(i)%key
call hash_data_write (hashtable%entry(i)%data, unit)
end if
end do

```

```

        end if
    end do
end subroutine hashtable_write

```

6.2.3 Hashtable insertion

Insert a single entry with the hash value as trial place. If the table is filled, first expand it.

```

(Hashtables: procedures) +=
subroutine hashtable_insert (hashtable, key, data)
    type(hashtable_t), intent(inout) :: hashtable
    integer(i8), dimension(:), intent(in) :: key
    type(hash_data_t), intent(in), target :: data
    integer(i32) :: h
    if (hashtable%n_entries >= hashtable%n_entries_max) &
        call hashtable_expand (hashtable)
    h = hash (key)
    call hashtable_insert_rec (hashtable, h, h, key, data)
end subroutine hashtable_insert

```

We need this auxiliary routine for doubling the size of the hashtable. We rely on the fact that default assignment copies the data pointer, not the data themselves. The temporary array must not be finalized; it is deallocated automatically together with its allocatable components.

```

(Hashtables: procedures) +=
subroutine hashtable_expand (hashtable)
    type(hashtable_t), intent(inout) :: hashtable
    type(hash_entry_t), dimension(:), allocatable :: table_tmp
    integer :: i, s
    allocate (table_tmp (0:hashtable%mask))
    table_tmp = hashtable%entry
    deallocate (hashtable%entry)
    s = 2 * size (table_tmp)
    hashtable%n_entries = 0
    hashtable%n_entries_max = s * hashtable%fill_ratio
    hashtable%mask = s - 1
    allocate (hashtable%entry (0:hashtable%mask))
    do i = 0, ubound (table_tmp, 1)
        if (associated (table_tmp(i)%data)) then
            call hashtable_insert_rec (hashtable, table_tmp(i)%hashval, &
                table_tmp(i)%hashval, table_tmp(i)%key, table_tmp(i)%data)
        end if
    end do
end subroutine hashtable_expand

```

Insert a single entry at a trial place *h*, reduced to the table size. Collision resolution is done simply by choosing the next element, recursively until the place is empty. For bookkeeping, we preserve the original hash value. For a good hash function, there should be no clustering.

Note that if the new key exactly matches an existing key, nothing is done.

```

(Hashtables: procedures) +=

```

```

recursive subroutine hashtable_insert_rec (hashtable, h, hashval, key, data)
  type(hashtable_t), intent(inout) :: hashtable
  integer(i32), intent(in) :: h, hashval
  integer(i8), dimension(:), intent(in) :: key
  type(hash_data_t), intent(in), target :: data
  integer(i32) :: i
  i = iand (h, hashtable%mask)
  if (associated (hashtable%entry(i)%data)) then
    if (size (hashtable%entry(i)%key) /= size (key)) then
      call hashtable_insert_rec (hashtable, h + 1, hashval, key, data)
    else if (any (hashtable%entry(i)%key /= key)) then
      call hashtable_insert_rec (hashtable, h + 1, hashval, key, data)
    end if
  else
    hashtable%entry(i)%hashval = hashval
    allocate (hashtable%entry(i)%key (size (key)))
    hashtable%entry(i)%key = key
    hashtable%entry(i)%data => data
    hashtable%n_entries = hashtable%n_entries + 1
  end if
end subroutine hashtable_insert_rec

```

6.2.4 Hashtable lookup

The lookup function has to parallel the insert function. If the place is filled, check if the key matches. Yes: return the pointer; no: increment the hash value and check again.

(Hashtables: procedures)+≡

```

function hashtable_lookup (hashtable, key) result (ptr)
  type(hash_data_t), pointer :: ptr
  type(hashtable_t), intent(in) :: hashtable
  integer(i8), dimension(:), intent(in) :: key
  ptr => hashtable_lookup_rec (hashtable, hash (key), key)
end function hashtable_lookup

```

(Hashtables: procedures)+≡

```

recursive function hashtable_lookup_rec (hashtable, h, key) result (ptr)
  type(hash_data_t), pointer :: ptr
  type(hashtable_t), intent(in) :: hashtable
  integer(i32), intent(in) :: h
  integer(i8), dimension(:), intent(in) :: key
  integer(i32) :: i
  i = iand (h, hashtable%mask)
  if (associated (hashtable%entry(i)%data)) then
    if (size (hashtable%entry(i)%key) == size (key)) then
      if (all (hashtable%entry(i)%key == key)) then
        ptr => hashtable%entry(i)%data
      else
        ptr => hashtable_lookup_rec (hashtable, h + 1, key)
      end if
    else
      ptr => hashtable_lookup_rec (hashtable, h + 1, key)
    end if
  end if
end function hashtable_lookup_rec

```

```

        end if
    else
        ptr => null ()
    end if
end function hashtable_lookup_rec

```

```

<Hashtables: public>≡
    public :: hashtable_test

<Hashtables: procedures>+≡
    subroutine hashtable_test ()
        type(hash_data_t), pointer :: data
        type(hashtable_t) :: hashtable
        integer(i8) :: i
        call hashtable_init (hashtable, 16, 0.25)
        do i = 1, 10
            allocate (data)
            data%i = i*i
            call hashtable_insert (hashtable, [i, i+i], data)
        end do
        call hashtable_insert (hashtable, [2_i8, 4_i8], data)
        call hashtable_write (hashtable)
        data => hashtable_lookup (hashtable, [5_i8, 10_i8])
        if (associated (data)) then
            print *, "lookup:", data%i
        else
            print *, "lookup: --"
        end if
        data => hashtable_lookup (hashtable, [6_i8, 12_i8])
        if (associated (data)) then
            print *, "lookup:", data%i
        else
            print *, "lookup: --"
        end if
        data => hashtable_lookup (hashtable, [4_i8, 9_i8])
        if (associated (data)) then
            print *, "lookup:", data%i
        else
            print *, "lookup: --"
        end if
        call hashtable_final (hashtable)
    end subroutine hashtable_test

```

6.3 MD5 Checksums

Implementing MD5 checksums allows us to check input/file integrity on the basis of a well-known standard. The building blocks have been introduced in the `bytes` module.

```

<md5.f90>≡
    <File header>

```

```

module md5

    use kinds, only: i8, i32, i64
    use io_units
    use unit_tests
    use system_defs, only: BUFFER_SIZE
    use system_defs, only: LF, EOR, EOF
    use diagnostics
    use bytes

    <Standard module head>

    <MD5: public>

    <MD5: types>

    <MD5: variables>

    <MD5: interfaces>

    contains

    <MD5: procedures>

    <MD5: tests>

end module md5

```

6.3.1 Blocks

A block is a sequence of 16 words (64 bytes or 512 bits). We anticipate that blocks will be linked, so include a pointer to the next block. There is a fill status (word counter), as there is one for each word. The fill status is equal to the number of bytes that are in, so it may be between 0 and 64.

```

<MD5: types>≡
    type :: block_t
    private
        type(word32_t), dimension(0:15) :: w
        type(block_t), pointer :: next => null ()
        integer :: fill = 0
    end type block_t

```

Check if a block is completely filled or empty:

```

<MD5: procedures>≡
    function block_is_empty (b)
        type(block_t), intent(in) :: b
        logical :: block_is_empty
        block_is_empty = (b%fill == 0 .and. word32_empty (b%w(0)))
    end function block_is_empty

    function block_is_filled (b)
        type(block_t), intent(in) :: b
        logical :: block_is_filled

```

```

        block_is_filled = (b%fill == 64)
    end function block_is_filled

```

Append a single byte to a block. Works only if the block is not yet filled.

(MD5: procedures)+≡

```

subroutine block_append_byte (bl, by)
    type(block_t), intent(inout) :: bl
    type(byte_t), intent(in) :: by
    if (.not. block_is_filled (bl)) then
        call word32_append_byte (bl%w(bl%fill/4), by)
        bl%fill = bl%fill + 1
    end if
end subroutine block_append_byte

```

The printing routine allows for printing as sequences of words or bytes, decimal or hex.

(MD5: interfaces)≡

```

interface block_write
    module procedure block_write_unit
end interface

```

(MD5: procedures)+≡

```

subroutine block_write_unit (b, unit, bytes, decimal)
    type(block_t), intent(in) :: b
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: bytes, decimal
    logical :: by, dc
    integer :: i, u
    u = given_output_unit (unit); if (u < 0) return
    by = .false.; if (present (bytes)) by = bytes
    dc = .false.; if (present (decimal)) dc = decimal
    do i = 0, b%fill/4 - 1
        call newline_or_blank (u, i, by, dc)
        call word32_write (b%w(i), unit, bytes, decimal)
    end do
    if (.not. block_is_filled (b)) then
        i = b%fill/4
        if (.not. word32_empty (b%w(i))) then
            call newline_or_blank (u, i, by, dc)
            call word32_write (b%w(i), unit, bytes, decimal)
        end if
    end if
    write (u, *)
contains
    subroutine newline_or_blank (u, i, bytes, decimal)
        integer, intent(in) :: u, i
        logical, intent(in) :: bytes, decimal
        if (decimal) then
            select case (i)
            case (0)
            case (2,4,6,8,10,12,14); write (u, *)
            case default
                write (u, '(2x)', advance='no')

```

```

        end select
    else if (bytes) then
        select case (i)
        case (0)
        case (4,8,12); write (u, *)
        case default
            write (u, '(2x)', advance='no')
        end select
    else
        if (i == 8) write (u, *)
    end if
end subroutine newline_or_blank
end subroutine block_write_unit

```

6.3.2 Messages

A message (within this module) is a linked list of blocks.

(MD5: types)+≡

```

type :: message_t
private
type(block_t), pointer :: first => null ()
type(block_t), pointer :: last => null ()
integer :: n_blocks = 0
end type message_t

```

Clear the message list

(MD5: procedures)+≡

```

subroutine message_clear (m)
type(message_t), intent(inout) :: m
type(block_t), pointer :: b
nullify (m%last)
do
    b => m%first
    if (.not.(associated (b))) exit
    m%first => b%next
    deallocate (b)
end do
m%n_blocks = 0
end subroutine message_clear

```

Append an empty block to the message list

(MD5: procedures)+≡

```

subroutine message_append_new_block (m)
type(message_t), intent(inout) :: m
if (associated (m%last)) then
    allocate (m%last%next)
    m%last => m%last%next
    m%n_blocks = m%n_blocks + 1
else
    allocate (m%first)
    m%last => m%first

```

```

        m%n_blocks = 1
    end if
end subroutine message_append_new_block

```

Initialize: clear and allocate the first (empty) block.

```

⟨MD5: procedures⟩+≡
subroutine message_init (m)
    type(message_t), intent(inout) :: m
    call message_clear (m)
    call message_append_new_block (m)
end subroutine message_init

```

Append a single byte to a message. If necessary, allocate a new block. If the message is empty, initialize it.

```

⟨MD5: procedures⟩+≡
subroutine message_append_byte (m, b)
    type(message_t), intent(inout) :: m
    type(byte_t), intent(in) :: b
    if (.not. associated (m%last)) then
        call message_init (m)
    else if (block_is_filled (m%last)) then
        call message_append_new_block (m)
    end if
    call block_append_byte (m%last, b)
end subroutine message_append_byte

```

Append zero bytes until the current block is filled up to the required position. If we are already beyond that, append a new block and fill that one.

```

⟨MD5: procedures⟩+≡
subroutine message_pad_zero (m, i)
    type(message_t), intent(inout) :: m
    integer, intent(in) :: i
    type(block_t), pointer :: b
    integer :: j
    if (associated (m%last)) then
        b => m%last
        if (b%fill > i) then
            do j = b%fill + 1, 64 + i
                call message_append_byte (m, byte_zero)
            end do
        else
            do j = b%fill + 1, i
                call message_append_byte (m, byte_zero)
            end do
        end if
    end if
end subroutine message_pad_zero

```

This returns the number of bits within a message. We need a 64-bit word for the result since it may be more than 2^{31} . This is also required by the MD5 standard.

```

⟨MD5: procedures⟩+≡

```

```

function message_bits (m) result (length)
  type(message_t), intent(in) :: m
  type(word64_t) :: length
  type(block_t), pointer :: b
  integer(i64) :: n_blocks_filled, n_bytes_extra
  if (m%n_blocks > 0) then
    b => m%last
    if (block_is_filled (b)) then
      n_blocks_filled = m%n_blocks
      n_bytes_extra = 0
    else
      n_blocks_filled = m%n_blocks - 1
      n_bytes_extra = b%fill
    end if
    length = n_blocks_filled * 512 + n_bytes_extra * 8
  else
    length = 0_i64
  end if
end function message_bits

```

6.3.3 Message I/O

Append the contents of a string to a message. We first cast the character string into a 8-bit integer array and then append this byte by byte.

(MD5: procedures)+≡

```

subroutine message_append_string (m, s)
  type(message_t), intent(inout) :: m
  character(len=*), intent(in) :: s
  integer(i64) :: i, n_bytes
  integer(i8), dimension(:), allocatable :: buffer
  integer(i8), dimension(1) :: mold
  type(byte_t) :: b
  n_bytes = size (transfer (s, mold))
  allocate (buffer (n_bytes))
  buffer = transfer (s, mold)
  do i = 1, size (buffer)
    b = buffer(i)
    call message_append_byte (m, b)
  end do
  deallocate (buffer)
end subroutine message_append_string

```

Append the contents of a 32-bit integer to a message. We first cast the 32-bit integer into a 8-bit integer array and then append this byte by byte.

(MD5: procedures)+≡

```

subroutine message_append_i32 (m, x)
  type(message_t), intent(inout) :: m
  integer(i32), intent(in) :: x
  integer(i8), dimension(4) :: buffer
  type(byte_t) :: b
  integer :: i
  buffer = transfer (x, buffer, size(buffer))

```

```

do i = 1, size (buffer)
  b = buffer(i)
  call message_append_byte (m, b)
end do
end subroutine message_append_i32

```

Append one line from file to a message. Include the newline character.

<MD5: procedures>+≡

```

subroutine message_append_from_unit (m, u, iostat)
  type(message_t), intent(inout) :: m
  integer, intent(in) :: u
  integer, intent(out) :: iostat
  character(len=BUFFER_SIZE) :: buffer
  read (u, *, iostat=iostat) buffer
  call message_append_string (m, trim (buffer))
  call message_append_string (m, LF)
end subroutine message_append_from_unit

```

Fill a message from file. (Each line counts as a string.)

<MD5: procedures>+≡

```

subroutine message_read_from_file (m, f)
  type(message_t), intent(inout) :: m
  character(len=*), intent(in) :: f
  integer :: u, iostat
  u = free_unit ()
  open (file=f, unit=u, action='read')
  do
    call message_append_from_unit (m, u, iostat=iostat)
    if (iostat < 0) exit
  end do
  close (u)
end subroutine message_read_from_file

```

Write a message. After each block, insert an empty line.

<MD5: interfaces>+≡

```

interface message_write
  module procedure message_write_unit
end interface

```

<MD5: procedures>+≡

```

subroutine message_write_unit (m, unit, bytes, decimal)
  type(message_t), intent(in) :: m
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: bytes, decimal
  type(block_t), pointer :: b
  integer :: u
  u = given_output_unit (unit); if (u < 0) return
  b => m%first
  if (associated (b)) then
    do
      call block_write_unit (b, unit, bytes, decimal)
      b => b%next
    if (.not. associated (b)) exit
  end if
end subroutine message_write_unit

```

```

        write (u, *)
    end do
end if
end subroutine message_write_unit

```

6.3.4 Auxiliary functions

These four functions on three words are defined in the MD5 standard:

```

<MD5: procedures>+≡
function ff (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: ff
    ff = ior (iand (x, y), iand (not (x), z))
end function ff

function fg (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: fg
    fg = ior (iand (x, z), iand (y, not (z)))
end function fg

function fh (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: fh
    fh = ieor (ieor (x, y), z)
end function fh

function fi (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: fi
    fi = ieor (y, ior (x, not (z)))
end function fi

```

6.3.5 Auxiliary stuff

This defines and initializes the table of transformation constants:

```

<MD5: variables>≡
type(word32_t), dimension(64), save :: t
logical, save :: table_initialized = .false.

<MD5: procedures>+≡
subroutine table_init
    type(word64_t) :: ww
    integer :: i
    if (.not.table_initialized) then
        do i = 1, 64
            ww = int (4294967296d0 * abs (sin (i * 1d0)), kind=i64)
            t(i) = word32_from_word64 (ww, 0)
        end do
        table_initialized = .true.
    end if
end subroutine table_init

```

```
end subroutine table_init
```

This encodes the message digest (4 words) into a 32-character string.

(MD5: procedures)+≡

```
function digest_string (aa) result (s)
  type(word32_t), dimension (0:3), intent(in) :: aa
  character(len=32) :: s
  integer :: i, j
  do i = 0, 3
    do j = 0, 3
      call byte_write (byte_from_word32 (aa(i), j), s(i*8+j*2+1:i*8+j*2+2))
    end do
  end do
end function digest_string
```

6.3.6 MD5 algorithm

Pad the message with a byte x80 and then pad zeros up to a full block minus two words; in these words, insert the message length (before padding) as a 64-bit word, low-word first.

(MD5: procedures)+≡

```
subroutine message_pad (m)
  type(message_t), intent(inout) :: m
  type(word64_t) :: length
  integer(i8), parameter :: ipad = -128 ! z'80'
  type(byte_t) :: b
  integer :: i
  length = message_bits (m)
  b = ipad
  call message_append_byte (m, b)
  call message_pad_zero (m, 56)
  do i = 0, 7
    call message_append_byte (m, byte_from_word64 (length, i))
  end do
end subroutine message_pad
```

Apply a series of transformations onto a state a,b,c,d, where the transform function uses each word of the message together with the predefined words. Finally, encode the state as a 32-character string.

(MD5: procedures)+≡

```
subroutine message_digest (m, s)
  type(message_t), intent(in) :: m
  character(len=32), intent(out) :: s
  integer(i32), parameter :: ia = 1732584193 ! z'67452301'
  integer(i32), parameter :: ib = -271733879 ! z'efcdab89'
  integer(i32), parameter :: ic = -1732584194 ! z'98badcfe'
  integer(i32), parameter :: id = 271733878 ! z'10325476'
  type(word32_t) :: a, b, c, d
  type(word32_t) :: aa, bb, cc, dd
  type(word32_t), dimension(0:15) :: x
  type(block_t), pointer :: bl
```

```

call table_init
a = ia; b = ib; c = ic; d = id
bl => m%first
do
  if (.not.associated (bl)) exit
  x = bl%w
  aa = a; bb = b; cc = c; dd = d
  call transform (ff, a, b, c, d, 0, 7, 1)

    d = d + dd
    bl => bl%next
end do
s = digest_string ([a, b, c, d])
contains
<MD5: Internal subroutine transform>
end subroutine message_digest

```

And this is the actual transformation that depends on one of the previous functions, four words, and three integers. The implicit arguments are *x*, the word from the message to digest, and *t*, the entry in the predefined table.

```

<MD5: Internal subroutine transform>≡
subroutine transform (f, a, b, c, d, k, s, i)
  interface
    function f (x, y, z)
      import word32_t
      type(word32_t), intent(in) :: x, y, z
      type(word32_t) :: f
    end function f
  end interface
  type(word32_t), intent(inout) :: a
  type(word32_t), intent(in) :: b, c, d
  integer, intent(in) :: k, s, i
  a = b + ishftc (a + f(b, c, d) + x(k) + t(i), s)
end subroutine transform

```

6.3.7 User interface

```

<MD5: public>≡
public :: md5sum

<MD5: interfaces>+≡
interface md5sum

```

```

        module procedure md5sum_from_string
        module procedure md5sum_from_unit
    end interface

```

This function computes the MD5 sum of the input string and returns it as a 32-character string

<MD5: procedures>+≡

```

function md5sum_from_string (s) result (digest)
    character(len=*), intent(in) :: s
    character(len=32) :: digest
    type(message_t) :: m
    call message_append_string (m, s)
    call message_pad (m)
    call message_digest (m, digest)
    call message_clear (m)
end function md5sum_from_string

```

This funct. reads from unit u (an unformatted sequence of integers) and computes the MD5 sum.

<MD5: procedures>+≡

```

function md5sum_from_unit (u) result (digest)
    integer, intent(in) :: u
    character(len=32) :: digest
    type(message_t) :: m
    character :: char
    integer :: iostat
    READ_CHARS: do
        read (u, "(A)", advance="no", iostat=iostat) char
        select case (iostat)
        case (0)
            call message_append_string (m, char)
        case (EOR)
            call message_append_string (m, LF)
        case (EOF)
            exit READ_CHARS
        case default
            call msg_fatal &
                ("Computing MD5 sum: I/O error while reading from scratch file")
        end select
    end do READ_CHARS
    call message_pad (m)
    call message_digest (m, digest)
    call message_clear (m)
end function md5sum_from_unit

```

6.3.8 Unit tests

<MD5: public>+≡

```

public :: md5_test

```

<MD5: procedures>+≡

```

subroutine md5_test (u, results)
    integer, intent(in) :: u

```

6.4 Permutations

Permute arrays of integers (of specific kind).

```
<permutations.f90>≡  
  <File header>  
  
  module permutations  
  
    use kinds, only: TC  
  
    <Standard module head>  
  
    <Permutations: public>  
  
    <Permutations: types>  
  
    <Permutations: interfaces>  
  
    contains  
  
    <Permutations: procedures>  
  
  end module permutations
```

6.4.1 Permutations

A permutation is an array of integers. Each integer between one and `size` should occur exactly once.

```
<Permutations: public>≡  
  public :: permutation_t  
  
<Permutations: types>≡  
  type :: permutation_t  
    private  
    integer, dimension(:), allocatable :: p  
  end type permutation_t
```

Initialize with the identity permutation.

```
<Permutations: public>+≡  
  public :: permutation_init  
  public :: permutation_final  
  
<Permutations: procedures>≡  
  elemental subroutine permutation_init (p, size)  
    type(permutation_t), intent(inout) :: p  
    integer, intent(in) :: size  
    integer :: i  
    allocate (p%p (size))  
    forall (i = 1:size)  
      p%p(i) = i  
    end forall  
  end subroutine permutation_init
```

```

elemental subroutine permutation_final (p)
  type(permutation_t), intent(inout) :: p
  deallocate (p%p)
end subroutine permutation_final

```

I/O:

```

⟨Permutations: public⟩+=
  public :: permutation_write

⟨Permutations: procedures⟩+=
  subroutine permutation_write (p, u)
    type(permutation_t), intent (in) :: p
    integer, intent(in) :: u
    integer :: i
    do i = 1, size (p%p)
      if (size (p%p) < 10) then
        write (u,"(1x,I1)", advance="no") p%p(i)
      else
        write (u,"(1x,I3)", advance="no") p%p(i)
      end if
    end do
    write (u, *)
  end subroutine permutation_write

```

Administration:

```

⟨Permutations: public⟩+=
  public :: permutation_size

⟨Permutations: procedures⟩+=
  elemental function permutation_size (perm) result (s)
    type(permutation_t), intent(in) :: perm
    integer :: s
    s = size (perm%p)
  end function permutation_size

```

Extract an entry in a permutation.

```

⟨Permutations: public⟩+=
  public :: permute

⟨Permutations: procedures⟩+=
  elemental function permute (i, p) result (j)
    integer, intent(in) :: i
    type(permutation_t), intent(in) :: p
    integer :: j
    if (i > 0 .and. i <= size (p%p)) then
      j = p%p(i)
    else
      j = 0
    end if
  end function permute

```

Check whether a permutation is valid: Each integer in the range occurs exactly once.

```

(Permutations: public) +=
    public :: permutation_ok

(Permutations: procedures) +=
    elemental function permutation_ok (perm) result (ok)
        type(permutation_t), intent(in) :: perm
        logical :: ok
        integer :: i
        logical, dimension(:), allocatable :: set
        ok = .true.
        allocate (set (size (perm%p)))
        set = .false.
        do i = 1, size (perm%p)
            ok = (perm%p(i) > 0 .and. perm%p(i) <= size (perm%p))
            if (.not.ok) return
            set(perm%p(i)) = .true.
        end do
        ok = all (set)
    end function permutation_ok

```

Find the permutation that transforms the second array into the first one. We assume that this is possible and unique and all bounds are set correctly.

This cannot be elemental.

```

(Permutations: public) +=
    public :: permutation_find

(Permutations: procedures) +=
    subroutine permutation_find (perm, a1, a2)
        type(permutation_t), intent(inout) :: perm
        integer, dimension(:), intent(in) :: a1, a2
        integer :: i, j
        if (allocated (perm%p)) deallocate (perm%p)
        allocate (perm%p (size (a1)))
        do i = 1, size (a1)
            do j = 1, size (a2)
                if (a1(i) == a2(j)) then
                    perm%p(i) = j
                    exit
                end if
            end do
            perm%p(i) = 0
        end do
    end subroutine permutation_find

```

Find all permutations that transform an array of integers into itself. The resulting permutation list is allocated with the correct length and filled.

The first step is to count the number of different entries in `code`. Next, we scan `code` again and assign a mask to each different entry, true for all identical entries. Finally, we recursively permute the identity for each possible mask.

The permutation is done as follows: A list of all permutations of the initial one with respect to the current mask is generated, then the permutations are

generated in turn for each permutation in this list with the next mask. The result is always stored back into the main list, starting from the end of the current list.

```

(Permutations: public)+≡
    public :: permutation_array_make

(Permutations: procedures)+≡
    subroutine permutation_array_make (pa, code)
        type(permutation_t), dimension(:), allocatable, intent(out) :: pa
        integer, dimension(:), intent(in) :: code
        logical, dimension(size(code)) :: mask
        logical, dimension(:,:), allocatable :: imask
        integer, dimension(:), allocatable :: n_i
        type(permutation_t) :: p_init
        type(permutation_t), dimension(:), allocatable :: p_tmp
        integer :: psize, i, j, k, n_different, n, nn_k
        psize = size (code)
        mask = .true.
        n_different = 0
        do i=1, psize
            if (mask(i)) then
                n_different = n_different + 1
                mask = mask .and. (code /= code(i))
            end if
        end do
        allocate (imask(psize, n_different), n_i(n_different))
        mask = .true.
        k = 0
        do i=1, psize
            if (mask(i)) then
                k = k + 1
                imask(:,k) = (code == code(i))
                n_i(k) = factorial (count(imask(:,k)))
                mask = mask .and. (code /= code(i))
            end if
        end do
        n = product (n_i)
        allocate (pa (n))
        call permutation_init (p_init, psize)
        pa(1) = p_init
        nn_k = 1
        do k = 1, n_different
            allocate (p_tmp (n_i(k)))
            do i = nn_k, 1, -1
                call permutation_array_with_mask (p_tmp, imask(:,k), pa(i))
                do j = n_i(k), 1, -1
                    pa((i-1)*n_i(k) + j) = p_tmp(j)
                end do
            end do
            deallocate (p_tmp)
            nn_k = nn_k * n_i(k)
        end do
        call permutation_final (p_init)
        deallocate (imask, n_i)
    end subroutine

```

```
end subroutine permutation_array_make
```

Make a list of permutations of the elements marked true in the `mask` array. The final permutation list must be allocated with the correct length ($n!$). The third argument is the initial permutation to start with, which must have the same length as the `mask` array (this is not checked).

(*Permutations: procedures*) \equiv

```
subroutine permutation_array_with_mask (pa, mask, p_init)
  type(permutation_t), dimension(:), intent(inout) :: pa
  logical, dimension(:), intent(in) :: mask
  type(permutation_t), intent(in) :: p_init
  integer :: plen
  integer :: i, ii, j, fac_i, k, x
  integer, dimension(:), allocatable :: index
  plen = size (pa)
  allocate (index(count(mask)))
  ii = 0
  do i = 1, size (mask)
    if (mask(i)) then
      ii = ii + 1
      index(ii) = i
    end if
  end do
  pa = p_init
  ii = 0
  fac_i = 1
  do i = 1, size (mask)
    if (mask(i)) then
      ii = ii + 1
      fac_i = fac_i * ii
      x = permute (i, p_init)
      do j = 1, plen
        k = ii - mod (((j-1)*fac_i)/plen, ii)
        call insert (pa(j), x, k, ii, index)
      end do
    end if
  end do
  deallocate (index)
contains
  subroutine insert (p, x, k, n, index)
    type(permutation_t), intent(inout) :: p
    integer, intent(in) :: x, k, n
    integer, dimension(:), intent(in) :: index
    integer :: i
    do i = n, k+1, -1
      p%p(index(i)) = p%p(index(i-1))
    end do
    p%p(index(k)) = x
  end subroutine insert
end subroutine permutation_array_with_mask
```

The factorial function is needed for pre-determining the number of permutations that will be generated:

```

⟨Permutations: procedures⟩+=
  function factorial (n) result (f)
    integer, intent(in) :: n
    integer :: f
    integer :: i
    f = 1
    do i=2, abs(n)
      f = f*i
    end do
  end function factorial

```

6.4.2 Operations on binary codes

Binary codes are needed for phase-space trees. Since the permutation function uses permutations, and no other special type is involved, we put the functions here.

This is needed for phase space trees: permute bits in a tree binary code. If no permutation is given, leave as is. (We may want to access the permutation directly here if this is efficiency-critical.)

```

⟨Permutations: public⟩+=
  public :: tc_permute

⟨Permutations: procedures⟩+=
  function tc_permute (k, perm, mask_in) result (pk)
    integer(TC), intent(in) :: k, mask_in
    type(permutation_t), intent(in) :: perm
    integer(TC) :: pk
    integer :: i
    pk = iand (k, mask_in)
    do i = 1, size (perm%p)
      if (btest(k,i-1)) pk = ibset (pk, perm%p(i)-1)
    end do
  end function tc_permute

```

This routine returns the number of set bits in the tree code value **k**. Hence, it is the number of externals connected to the current line. If **mask** is present, the complement of the tree code is also considered, and the smaller number is returned. This gives the true distance from the external states, taking into account the initial particles. The complement number is increased by one, since for a scattering diagram the vertex with the sum of all final-state codes is still one point apart from the initial particles.

```

⟨Permutations: public⟩+=
  public :: tc_decay_level

⟨Permutations: interfaces⟩=
  interface tc_decay_level
    module procedure decay_level_simple
    module procedure decay_level_complement
  end interface

```

```

⟨Permutations: procedures⟩+=
  function decay_level_complement (k, mask) result (l)
    integer(TC), intent(in) :: k, mask
    integer :: l
    l = min (decay_level_simple (k), &
             & decay_level_simple (ieor (k, mask)) + 1)
  end function decay_level_complement

  function decay_level_simple (k) result(l)
    integer(TC), intent(in) :: k
    integer :: l
    integer :: i
    l = 0
    do i=0, bit_size(k)-1
      if (btest(k,i)) l = l+1
    end do
  end function decay_level_simple

```

6.5 Sorting

This small module provides functions for sorting integer or real arrays.

```

⟨sorting.f90⟩=
  ⟨File header⟩

  module sorting

    ⟨Use kinds⟩
    use unit_tests
    use diagnostics

    ⟨Standard module head⟩

    ⟨Sorting: public⟩

    ⟨Sorting: interfaces⟩

    contains

    ⟨Sorting: procedures⟩

    ⟨Sorting: tests⟩

    end module sorting

```

6.5.1 Implementation

The `sort` function returns, for a given integer or real array, the array sorted by increasing value. The current implementation is *mergesort*, which has $O(n \ln n)$ behavior in all cases, and is stable for elements of equal value.

The `sort_abs` variant sorts by increasing absolute value, where for identical absolute value, the positive number comes first.

```

<Sorting: public>≡
  public :: sort
  public :: sort_abs

<Sorting: interfaces>≡
  interface sort
    module procedure sort_int
    module procedure sort_real
  end interface

  interface sort_abs
    module procedure sort_int_abs
  end interface

```

This variant of integer sort returns The body is identical, just the interface differs.

```

<Sorting: procedures>≡
  function sort_int (val_in) result (val)
    integer, dimension(:), intent(in) :: val_in
    integer, dimension(size(val_in)) :: val
  <Sorting: sort>
  end function sort_int

  function sort_real (val_in) result (val)
    real(default), dimension(:), intent(in) :: val_in
    real(default), dimension(size(val_in)) :: val
  <Sorting: sort>
  end function sort_real

  function sort_int_abs (val_in) result (val)
    integer, dimension(:), intent(in) :: val_in
    integer, dimension(size(val_in)) :: val
  <Sorting: sort abs>
  end function sort_int_abs

<Sorting: sort>≡
  val = val_in( order (val_in) )

<Sorting: sort abs>≡
  val = val_in( order_abs (val_in) )

```

The `order` function returns, for a given integer or real array, the array of indices of the elements sorted by increasing value.

```

<Sorting: public>+≡
  public :: order
  public :: order_abs

<Sorting: interfaces>+≡
  interface order
    module procedure order_int
    module procedure order_real
  end interface

```

```

interface order_abs
  module procedure order_int_abs
end interface

```

```

⟨Sorting: procedures⟩+≡
  function order_int (val) result (idx)
    integer, dimension(:), intent(in) :: val
    integer, dimension(size(val)) :: idx
    ⟨Sorting: order⟩
  end function order_int

  function order_real (val) result (idx)
    real(default), dimension(:), intent(in) :: val
    integer, dimension(size(val)) :: idx
    ⟨Sorting: order⟩
  end function order_real

  function order_int_abs (val) result (idx)
    integer, dimension(:), intent(in) :: val
    integer, dimension(size(val)) :: idx
    ⟨Sorting: order abs⟩
  end function order_int_abs

```

We start by individual elements, merge them to pairs, merge those to four-element subarrays, and so on. The last subarray can extend only up to the original array bound, of course, and the second of the subarrays to merge should contain at least one element.

```

⟨Sorting: order⟩≡
  ⟨Sorting: order1⟩
    call merge (idx(b1:e2), idx(b1:e1), idx(b2:e2), val)
  ⟨Sorting: order2⟩

⟨Sorting: order abs⟩≡
  ⟨Sorting: order1⟩
    call merge_abs (idx(b1:e2), idx(b1:e1), idx(b2:e2), val)
  ⟨Sorting: order2⟩

⟨Sorting: order1⟩≡
  integer :: n, i, s, b1, b2, e1, e2
  n = size (idx)
  forall (i = 1:n)
    idx(i) = i
  end forall
  s = 1
  do while (s < n)
    do b1 = 1, n-s, 2*s
      b2 = b1 + s
      e1 = b2 - 1
      e2 = min (e1 + s, n)
    end do
    s = 2 * s
  end do

```

The merging step does the actual sorting. We take two sorted array sections and merge them to a sorted result array. We are working on the indices, and comparing is done by taking the associated `val` which is real or integer.

```

<Sorting: interfaces>+≡
  interface merge
    module procedure merge_int
    module procedure merge_real
  end interface

  interface merge_abs
    module procedure merge_int_abs
  end interface

<Sorting: procedures>+≡
  subroutine merge_int (res, src1, src2, val)
    integer, dimension(:), intent(out) :: res
    integer, dimension(:), intent(in) :: src1, src2
    integer, dimension(:), intent(in) :: val
    integer, dimension(size(res)) :: tmp
  <Sorting: merge>
  end subroutine merge_int

  subroutine merge_real (res, src1, src2, val)
    integer, dimension(:), intent(out) :: res
    integer, dimension(:), intent(in) :: src1, src2
    real(default), dimension(:), intent(in) :: val
    integer, dimension(size(res)) :: tmp
  <Sorting: merge>
  end subroutine merge_real

  subroutine merge_int_abs (res, src1, src2, val)
    integer, dimension(:), intent(out) :: res
    integer, dimension(:), intent(in) :: src1, src2
    integer, dimension(:), intent(in) :: val
    integer, dimension(size(res)) :: tmp
  <Sorting: merge abs>
  end subroutine merge_int_abs

<Sorting: merge>≡
  <Sorting: merge1>
    if (val(src1(i1)) <= val(src2(i2))) then
  <Sorting: merge2>

We keep the elements if the absolute values are strictly ordered. If they are
equal in magnitude, we keep them if the larger value comes first, or if they are
equal.

<Sorting: merge abs>≡
  <Sorting: merge1>
    if (abs (val(src1(i1))) < abs (val(src2(i2))) .or. &
        (abs (val(src1(i1))) == abs (val(src2(i2))) .and. &
        val(src1(i1)) >= val(src2(i2)))) then
  <Sorting: merge2>

```

```

<Sorting: merge1>≡
  integer :: i1, i2, i
  i1 = 1
  i2 = 1
  do i = 1, size (tmp)
    <Sorting: merge2>≡
      tmp(i) = src1(i1); i1 = i1 + 1
      if (i1 > size (src1)) then
        tmp(i+1:) = src2(i2:)
        exit
      end if
    else
      tmp(i) = src2(i2); i2 = i2 + 1
      if (i2 > size (src2)) then
        tmp(i+1:) = src1(i1:)
        exit
      end if
    end if
  end do
  res = tmp

```

6.5.2 Concatenating arrays

Not precisely a sorting function, but useful: Concatenate two arrays.

```

<Sorting: public>+≡
  public :: concat

<Sorting: interfaces>+≡
  interface concat
    module procedure concat_int
    module procedure concat_real
  end interface

<Sorting: procedures>+≡
  function concat_int (val1, val2) result (val12)
    integer, dimension(:), intent(in) :: val1, val2
    integer, dimension(size(val1)+size(val2)) :: val12
    <Sorting: concat>
  end function concat_int

  function concat_real (val1, val2) result (val12)
    real(default), dimension(:), intent(in) :: val1, val2
    integer, dimension(size(val1)+size(val2)) :: val12
    <Sorting: concat>
  end function concat_real

<Sorting: concat>≡
  val12(:size(val1)) = val1
  val12(size(val1)+1:) = val2

```

6.5.3 Unit tests

```

<Sorting: public>+≡
    public :: sorting_test

<Sorting: procedures>+≡
    subroutine sorting_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <Sorting: execute tests>
    end subroutine sorting_test

```

This checks whether the sorting routine works correctly.

```

<Sorting: execute tests>≡
    call test (sorting_1, "sorting_1", &
        "check sorting routines", &
        u, results)

<Sorting: tests>≡
    subroutine sorting_1 (u)
        integer, intent(in) :: u
        integer, parameter :: NMAX = 10
        real(default), dimension(NMAX) :: rval
        integer, dimension(NMAX) :: ival
        real, dimension(NMAX,NMAX) :: harvest_r
        integer, dimension(NMAX,NMAX) :: harvest_i
        integer, dimension(NMAX,NMAX) :: harvest_a
        integer :: i, j

do j = i, 2, -1
  if (abs(ival(j))-abs(ival(j-1)) < 0 .or. &
      (abs(ival(j))==abs(ival(j-1))) .and. ival(j)>ival(j-1)) &
    write (u, "(A)")  "*** Sorting failure. ***"
  end do
end do

write (u, "(A)")
write (u, "(A)")  "* Test output end: sorting_1"

end subroutine sorting_1

```

Chapter 7

Text handling

WHIZARD has to handle complex structures in input (and output) data. Doing this in a generic and transparent way requires a generic lexer and parser. The necessary modules are implemented here:

ifiles Implementation of line-oriented internal files in a more flexible way (linked lists of variable-length strings) than the Fortran builtin features.

lexers Read text and transform it into a token stream.

syntax_rules Define the rules for interpreting tokens, to be used by the WHIZARD parser.

parser Categorize tokens (keyword, string, number etc.) and use a set of syntax rules to transform the input into a parse tree.

xml Read and parse XML text, separate from the WHIZARD parser.

7.1 Internal files

The internal files introduced here (`ifile`) are a replacement for the built-in internal files, which are fixed-size arrays of fixed-length character strings. The `ifile` type is a doubly-linked list of variable-length character strings with line numbers.

```
<ifiles.f90>≡
  <File header>

  module ifiles

    <Use strings>
    use io_units
    use system_defs, only: EOF

    <Standard module head>

    <Ifiles: public>

    <Ifiles: types>

    <Ifiles: interfaces>

    contains

    <Ifiles: subroutines>

  end module ifiles
```

7.1.1 The line type

The line entry type is for internal use, it is the list entry to be collected in an `ifile` object.

```
<Ifiles: types>≡
  type :: line_entry_t
  private
  type(line_entry_t), pointer :: previous => null ()
  type(line_entry_t), pointer :: next => null ()
  type(string_t) :: string
  integer :: index
  end type line_entry_t
```

Create a new list entry, given a varying string as input. The line number and pointers are not set, these make sense only within an `ifile`.

```
<Ifiles: subroutines>≡
  subroutine line_entry_create (line, string)
    type(line_entry_t), pointer :: line
    type(string_t), intent(in) :: string
    allocate (line)
    line%string = string
  end subroutine line_entry_create
```

Destroy a single list entry: Since the pointer components should not be deallocated explicitly, just deallocate the object itself.

```

<Ifiles: subroutines>+≡
  subroutine line_entry_destroy (line)
    type(line_entry_t), pointer :: line
    deallocate (line)
  end subroutine line_entry_destroy

```

7.1.2 The ifile type

The internal file is a linked list of line entries.

```

<Ifiles: public>≡
  public :: ifile_t

<Ifiles: types>+≡
  type :: ifile_t
    private
    type(line_entry_t), pointer :: first => null ()
    type(line_entry_t), pointer :: last => null ()
    integer :: n_lines = 0
  end type ifile_t

```

We need no explicit initializer, but a routine which recursively deallocates the contents may be appropriate. After this, existing line pointers may become undefined, so they should be nullified before the file is destroyed.

```

<Ifiles: public>+≡
  public :: ifile_clear

<Ifiles: subroutines>+≡
  subroutine ifile_clear (ifile)
    type(ifile_t), intent(inout) :: ifile
    type(line_entry_t), pointer :: current
    do while (associated (ifile%first))
      current => ifile%first
      ifile%first => current%next
      call line_entry_destroy (current)
    end do
    nullify (ifile%last)
    ifile%n_lines = 0
  end subroutine ifile_clear

```

The finalizer is just an alias for the above.

```

<Ifiles: public>+≡
  public :: ifile_final

<Ifiles: interfaces>≡
  interface ifile_final
    module procedure ifile_clear
  end interface

```

7.1.3 I/O on ifiles

Fill an ifile from an ordinary external file, i.e., I/O unit. If the ifile is not empty, the old contents will be destroyed. We can read a fixed-length character string, an ISO varying string, an ordinary internal file (character-string array), or from an external unit. In the latter case, lines are appended until EOF is reached. Finally, there is a variant which reads from another ifile, effectively copying it.

```
<Ifiles: public>+≡
    public :: ifile_read

<Ifiles: interfaces>+≡
    interface ifile_read
        module procedure ifile_read_from_string
        module procedure ifile_read_from_char
        module procedure ifile_read_from_unit
        module procedure ifile_read_from_char_array
        module procedure ifile_read_from_ifile
    end interface

<Ifiles: subroutines>+≡
    subroutine ifile_read_from_string (ifile, string)
        type(ifile_t), intent(inout) :: ifile
        type(string_t), intent(in) :: string
        call ifile_clear (ifile)
        call ifile_append (ifile, string)
    end subroutine ifile_read_from_string

    subroutine ifile_read_from_char (ifile, char)
        type(ifile_t), intent(inout) :: ifile
        character(*), intent(in) :: char
        call ifile_clear (ifile)
        call ifile_append (ifile, char)
    end subroutine ifile_read_from_char

    subroutine ifile_read_from_char_array (ifile, char)
        type(ifile_t), intent(inout) :: ifile
        character(*), dimension(:), intent(in) :: char
        call ifile_clear (ifile)
        call ifile_append (ifile, char)
    end subroutine ifile_read_from_char_array

    subroutine ifile_read_from_unit (ifile, unit, iostat)
        type(ifile_t), intent(inout) :: ifile
        integer, intent(in) :: unit
        integer, intent(out), optional :: iostat
        call ifile_clear (ifile)
        call ifile_append (ifile, unit, iostat)
    end subroutine ifile_read_from_unit

    subroutine ifile_read_from_ifile (ifile, ifile_in)
        type(ifile_t), intent(inout) :: ifile
        type(ifile_t), intent(in) :: ifile_in
        call ifile_clear (ifile)
        call ifile_append (ifile, ifile_in)
    end subroutine ifile_read_from_ifile
```

Append to an ifile. The same as reading, but without resetting the ifile. In addition, there is a routine for appending a whole ifile.

```

<Ifiles: public>+≡
    public :: ifile_append

<Ifiles: interfaces>+≡
    interface ifile_append
        module procedure ifile_append_from_string
        module procedure ifile_append_from_char
        module procedure ifile_append_from_unit
        module procedure ifile_append_from_char_array
        module procedure ifile_append_from_ifile
    end interface

<Ifiles: subroutines>+≡
    subroutine ifile_append_from_string (ifile, string)
        type(ifile_t), intent(inout) :: ifile
        type(string_t), intent(in) :: string
        type(line_entry_t), pointer :: current
        call line_entry_create (current, string)
        current%index = ifile%n_lines + 1
        if (associated (ifile%last)) then
            current%previous => ifile%last
            ifile%last%next => current
        else
            ifile%first => current
        end if
        ifile%last => current
        ifile%n_lines = current%index
    end subroutine ifile_append_from_string

    subroutine ifile_append_from_char (ifile, char)
        type(ifile_t), intent(inout) :: ifile
        character(*), intent(in) :: char
        call ifile_append_from_string (ifile, var_str (trim (char)))
    end subroutine ifile_append_from_char

    subroutine ifile_append_from_char_array (ifile, char)
        type(ifile_t), intent(inout) :: ifile
        character(*), dimension(:), intent(in) :: char
        integer :: i
        do i = 1, size (char)
            call ifile_append_from_string (ifile, var_str (trim (char(i))))
        end do
    end subroutine ifile_append_from_char_array

    subroutine ifile_append_from_unit (ifile, unit, iostat)
        type(ifile_t), intent(inout) :: ifile
        integer, intent(in) :: unit
        integer, intent(out), optional :: iostat
        type(string_t) :: buffer
        integer :: ios
        ios = 0
        READ_LOOP: do

```

```

        call get (unit, buffer, iostat = ios)
        if (ios == EOF .or. ios > 0) exit READ_LOOP
        call ifile_append_from_string (ifile, buffer)
    end do READ_LOOP
    if (present (iostat)) then
        iostat = ios
    else if (ios > 0) then
        call get (unit, buffer) ! trigger error again
    end if
end subroutine ifile_append_from_unit

subroutine ifile_append_from_ifile (ifile, ifile_in)
    type(ifile_t), intent(inout) :: ifile
    type(ifile_t), intent(in) :: ifile_in
    type(line_entry_t), pointer :: current
    current => ifile_in%first
    do while (associated (current))
        call ifile_append_from_string (ifile, current%string)
        current => current%next
    end do
end subroutine ifile_append_from_ifile

```

Write the ifile contents to an external unit

```

<Ifiles: public>+≡
    public :: ifile_write

<Ifiles: subroutines>+≡
    subroutine ifile_write (ifile, unit, iostat)
        type(ifile_t), intent(in) :: ifile
        integer, intent(in), optional :: unit
        integer, intent(out), optional :: iostat
        integer :: u
        type(line_entry_t), pointer :: current
        u = given_output_unit (unit); if (u < 0) return
        current => ifile%first
        do while (associated (current))
            call put_line (u, current%string, iostat)
            current => current%next
        end do
    end subroutine ifile_write

```

Convert the ifile to an array of strings, which is allocated by this function:

```

<Ifiles: public>+≡
    public :: ifile_to_string_array

<Ifiles: subroutines>+≡
    subroutine ifile_to_string_array (ifile, string)
        type(ifile_t), intent(in) :: ifile
        type(string_t), dimension(:), intent(inout), allocatable :: string
        type(line_entry_t), pointer :: current
        integer :: i
        allocate (string (ifile_get_length (ifile)))
        current => ifile%first
        do i = 1, ifile_get_length (ifile)

```

```

        string(i) = current%string
        current => current%next
    end do
end subroutine ifile_to_string_array

```

7.1.4 Ifile tools

```

<Ifiles: public>+≡
    public :: ifile_get_length

<Ifiles: subroutines>+≡
    function ifile_get_length (ifile) result (length)
        integer :: length
        type(ifile_t), intent(in) :: ifile
        length = ifile%n_lines
    end function ifile_get_length

```

7.1.5 Line pointers

Instead of the implicit pointer used in ordinary file access, we define explicit pointers, so there can be more than one at a time.

```

<Ifiles: public>+≡
    public :: line_p

<Ifiles: types>+≡
    type :: line_p
    private
    type(line_entry_t), pointer :: p => null ()
end type line_p

```

Assign a file pointer to the first or last line in an ifile:

```

<Ifiles: public>+≡
    public :: line_init

<Ifiles: subroutines>+≡
    subroutine line_init (line, ifile, back)
        type(line_p), intent(inout) :: line
        type(ifile_t), intent(in) :: ifile
        logical, intent(in), optional :: back
        if (present (back)) then
            if (back) then
                line%p => ifile%last
            else
                line%p => ifile%first
            end if
        else
            line%p => ifile%first
        end if
    end subroutine line_init

```

Remove the pointer association:

```
<Ifiles: public>+≡
    public :: line_final

<Ifiles: subroutines>+≡
    subroutine line_final (line)
        type(line_p), intent(inout) :: line
        nullify (line%p)
    end subroutine line_final
```

Go one step forward

```
<Ifiles: public>+≡
    public :: line_advance

<Ifiles: subroutines>+≡
    subroutine line_advance (line)
        type(line_p), intent(inout) :: line
        if (associated (line%p)) line%p => line%p%next
    end subroutine line_advance
```

Go one step backward

```
<Ifiles: public>+≡
    public :: line_backspace

<Ifiles: subroutines>+≡
    subroutine line_backspace (line)
        type(line_p), intent(inout) :: line
        if (associated (line%p)) line%p => line%p%previous
    end subroutine line_backspace
```

Check whether we are accessing a valid line

```
<Ifiles: public>+≡
    public :: line_is_associated

<Ifiles: subroutines>+≡
    function line_is_associated (line) result (ok)
        logical :: ok
        type(line_p), intent(in) :: line
        ok = associated (line%p)
    end function line_is_associated
```

7.1.6 Access lines via pointers

We do not need the ifile as an argument to these functions, because the `line` type will point to an existing ifile.

```
<Ifiles: public>+≡
    public :: line_get_string
```

```

<Ifiles: subroutines>+≡
function line_get_string (line) result (string)
  type(string_t) :: string
  type(line_p), intent(in) :: line
  if (associated (line%p)) then
    string = line%p%string
  else
    string = ""
  end if
end function line_get_string

```

Variant where the line pointer is advanced after reading.

```

<Ifiles: public>+≡
public :: line_get_string_advance
<Ifiles: subroutines>+≡
function line_get_string_advance (line) result (string)
  type(string_t) :: string
  type(line_p), intent(inout) :: line
  if (associated (line%p)) then
    string = line%p%string
    call line_advance (line)
  else
    string = ""
  end if
end function line_get_string_advance

```

```

<Ifiles: public>+≡
public :: line_get_index
<Ifiles: subroutines>+≡
function line_get_index (line) result (index)
  integer :: index
  type(line_p), intent(in) :: line
  if (associated (line%p)) then
    index = line%p%index
  else
    index = 0
  end if
end function line_get_index

```

```

<Ifiles: public>+≡
public :: line_get_length
<Ifiles: subroutines>+≡
function line_get_length (line) result (length)
  integer :: length
  type(line_p), intent(in) :: line
  if (associated (line%p)) then
    length = len (line%p%string)
  else
    length = 0
  end if
end function line_get_length

```

7.2 Lexer

The lexer purpose is to read from a line-separated character input stream (usually a file) and properly chop the stream into lexemes (tokens). [The parser will transform lexemes into meaningful tokens, to be stored in a parse tree, therefore we do not use the term 'token' here.] The input is read line-by-line, but interpreted free-form, except for quotes and the comment syntax. (Fortran 2003 would allow us to use a stream type for reading.)

In an object-oriented approach, we can dynamically create and destroy lexers, including the lexer setup.

The main lexer function is to return a lexeme according to the basic lexer rules (quotes, comments, whitespace, special classes). There is also a routine to write back a lexeme to the input stream (but only once).

For the rules, we separate the possible characters into classes. Whitespace usually consists of blank, tab, and line-feed, where any number of consecutive whitespace is equivalent to one. Quoted strings are enclosed by a pair of quote characters, possibly multiline. Comments are similar to quotes, but interpreted as whitespace. Numbers are identified (not distinguishing real and integer) but not interpreted. Other character classes make up identifiers.

```
<lexers.f90>≡  
  <File header>  
  
  module lexers  
  
    <Use strings>  
    use io_units  
    use string_utils  
    use unit_tests  
    use system_defs, only: EOF, EOR  
    use system_defs, only: LF  
    use system_defs, only: WHITESPACE_CHARS, LCLETTERS, UCLETTERS, DIGITS  
    use diagnostics  
    use ifiles, only: ifile_t  
    use ifiles, only: line_p, line_is_associated, line_init, line_final  
    use ifiles, only: line_get_string_advance  
  
    <Standard module head>  
  
    <Lexer: public>  
  
    <Lexer: parameters>  
  
    <Lexer: types>  
  
    <Lexer: interfaces>  
  
    contains  
  
    <Lexer: procedures>  
  
    <Lexer: tests>
```

```
end module lexers
```

7.2.1 Input streams

For flexible input, we define a generic stream type that refers to either an external file, an external unit which is already open, a string, an `ifile` object (internal file, i.e., string list), or a line pointer to an `ifile` object. The stream type actually follows the idea of a formatted external file, which is line-oriented. Thus, the stream reader always returns a whole record (input line).

Note that only in the string version, the stream contents are stored inside the stream object. In the `ifile` version, the stream contains only the line pointer, while in the external-file case, the line pointer is implicitly created by the runtime library.

```
<Lexer: public>≡
  public :: stream_t

<Lexer: types>≡
  type :: stream_t
    type(string_t), pointer :: filename => null ()
    integer, pointer :: unit => null ()
    type(string_t), pointer :: string => null ()
    type(ifile_t), pointer :: ifile => null ()
    type(line_p), pointer :: line => null ()
    integer :: record = 0
    logical :: eof = .false.
  end type stream_t
```

The initializers refer to the specific version. The stream should be undefined before calling this.

```
<Lexer: public>+≡
  public :: stream_init

<Lexer: interfaces>≡
  interface stream_init
    module procedure stream_init_filename
    module procedure stream_init_unit
    module procedure stream_init_string
    module procedure stream_init_ifile
    module procedure stream_init_line
  end interface

<Lexer: procedures>≡
  subroutine stream_init_filename (stream, filename)
    type(stream_t), intent(out) :: stream
    character(*), intent(in) :: filename
    integer :: unit
    unit = free_unit ()
    open (unit=unit, file=filename, status="old", action="read")
    call stream_init_unit (stream, unit)
    allocate (stream%filename)
    stream%filename = filename
  end subroutine stream_init_filename
```

```

subroutine stream_init_unit (stream, unit)
  type(stream_t), intent(out) :: stream
  integer, intent(in) :: unit
  allocate (stream%unit)
  stream%unit = unit
  stream%eof = .false.
end subroutine stream_init_unit

subroutine stream_init_string (stream, string)
  type(stream_t), intent(out) :: stream
  type(string_t), intent(in) :: string
  allocate (stream%string)
  stream%string = string
end subroutine stream_init_string

subroutine stream_init_ifile (stream, ifile)
  type(stream_t), intent(out) :: stream
  type(ifile_t), intent(in) :: ifile
  type(line_p) :: line
  call line_init (line, ifile)
  call stream_init_line (stream, line)
  allocate (stream%ifile)
  stream%ifile = ifile
end subroutine stream_init_ifile

subroutine stream_init_line (stream, line)
  type(stream_t), intent(out) :: stream
  type(line_p), intent(in) :: line
  allocate (stream%line)
  stream%line = line
end subroutine stream_init_line

```

The finalizer restores the initial state. If an external file was opened, it is closed.

```

<Lexer: public>+≡
  public :: stream_final

<Lexer: procedures>+≡
  subroutine stream_final (stream)
    type(stream_t), intent(inout) :: stream
    if (associated (stream%filename)) then
      close (stream%unit)
      deallocate (stream%unit)
      deallocate (stream%filename)
    else if (associated (stream%unit)) then
      deallocate (stream%unit)
    else if (associated (stream%string)) then
      deallocate (stream%string)
    else if (associated (stream%ifile)) then
      call line_final (stream%line)
      deallocate (stream%line)
      deallocate (stream%ifile)
    else if (associated (stream%line)) then
      call line_final (stream%line)
      deallocate (stream%line)
    end if
  end subroutine stream_final

```

```

        end if
    end subroutine stream_final

```

This returns the next record from the input stream. Depending on the stream type, the stream pointers are modified: Reading from external unit, the external file is advanced (implicitly). Reading from string, the string is replaced by an empty string. Reading from ifile, the line pointer is advanced. Note that the iostat argument is mandatory.

<Lexer: public>+≡

```

    public :: stream_get_record

```

<Lexer: procedures>+≡

```

subroutine stream_get_record (stream, string, iostat)
    type(stream_t), intent(inout) :: stream
    type(string_t), intent(out) :: string
    integer, intent(out) :: iostat
    if (associated (stream%unit)) then
        if (stream%eof) then
            iostat = EOF
        else
            call get (stream%unit, string, iostat=iostat)
            if (iostat == EOR) then
                iostat = 0
                stream%record = stream%record + 1
            end if
            if (iostat == EOF) then
                iostat = 0
                stream%eof = .true.
                if (len (string) /= 0) stream%record = stream%record + 1
            end if
        end if
    else if (associated (stream%string)) then
        if (len (stream%string) /= 0) then
            string = stream%string
            stream%string = ""
            iostat = 0
            stream%record = stream%record + 1
        else
            string = ""
            iostat = EOF
        end if
    else if (associated (stream%line)) then
        if (line_is_associated (stream%line)) then
            string = line_get_string_advance (stream%line)
            iostat = 0
            stream%record = stream%record + 1
        else
            string = ""
            iostat = EOF
        end if
    else
        call msg_bug (" Attempt to read from uninitialized input stream")
    end if
end subroutine stream_get_record

```

Return the current stream source as a message string.

```
<Lexer: public>+≡
    public :: stream_get_source_info_string

<Lexer: procedures>+≡
    function stream_get_source_info_string (stream) result (string)
        type(string_t) :: string
        type(stream_t), intent(in) :: stream
        character(20) :: buffer
        if (associated (stream%filename)) then
            string = "File '" // stream%filename // "' (unit = "
            write (buffer, "(IO)") stream%unit
            string = string // trim (buffer) // ")"
        else if (associated (stream%unit)) then
            write (buffer, "(IO)") stream%unit
            string = "Unit " // trim (buffer)
        else if (associated (stream%string)) then
            string = "Input string"
        else if (associated (stream%ifile) .or. associated (stream%line)) then
            string = "Internal file"
        else
            string = ""
        end if
    end function stream_get_source_info_string
```

Return the index of the record just read as a message string.

```
<Lexer: public>+≡
    public :: stream_get_record_info_string

<Lexer: procedures>+≡
    function stream_get_record_info_string (stream) result (string)
        type(string_t) :: string
        type(stream_t), intent(in) :: stream
        character(20) :: buffer
        string = stream_get_source_info_string (stream)
        if (string /= "") string = string // ", "
        write (buffer, "(IO)") stream%record
        string = string // "line " // trim (buffer)
    end function stream_get_record_info_string
```

7.2.2 Keyword list

The lexer should be capable of identifying a token as a known keyword. To this end, we store a list of keywords:

```
<Lexer: public>+≡
    public :: keyword_list_t

<Lexer: types>+≡
    type :: keyword_entry_t
        private
        type(string_t) :: string
```

```

        type(keyword_entry_t), pointer :: next => null ()
    end type keyword_entry_t

    type :: keyword_list_t
    private
        type(keyword_entry_t), pointer :: first => null ()
        type(keyword_entry_t), pointer :: last => null ()
    end type keyword_list_t

```

Add a new string to the keyword list, unless it is already there:

```

<Lexer: public>+≡
    public :: keyword_list_add

<Lexer: procedures>+≡
    subroutine keyword_list_add (keylist, string)
        type(keyword_list_t), intent(inout) :: keylist
        type(string_t), intent(in) :: string
        type(keyword_entry_t), pointer :: k_entry_new
        if (.not. keyword_list_contains (keylist, string)) then
            allocate (k_entry_new)
            k_entry_new%string = string
            if (associated (keylist%first)) then
                keylist%last%next => k_entry_new
            else
                keylist%first => k_entry_new
            end if
            keylist%last => k_entry_new
        end if
    end subroutine keyword_list_add

```

Return true if a string is a keyword.

```

<Lexer: public>+≡
    public :: keyword_list_contains

<Lexer: procedures>+≡
    function keyword_list_contains (keylist, string) result (found)
        type(keyword_list_t), intent(in) :: keylist
        type(string_t), intent(in) :: string
        logical :: found
        found = .false.
        call check_rec (keylist%first)
    contains
        recursive subroutine check_rec (k_entry)
            type(keyword_entry_t), pointer :: k_entry
            if (associated (k_entry)) then
                if (k_entry%string /= string) then
                    call check_rec (k_entry%next)
                else
                    found = .true.
                end if
            end if
        end subroutine check_rec
    end function keyword_list_contains

```

Write the keyword list

```
<Lexer: public>+≡
    public :: keyword_list_write

<Lexer: interfaces>+≡
    interface keyword_list_write
        module procedure keyword_list_write_unit
    end interface

<Lexer: procedures>+≡
    subroutine keyword_list_write_unit (keylist, unit)
        type(keyword_list_t), intent(in) :: keylist
        integer, intent(in) :: unit
        write (unit, "(A)") "Keyword list:"
        if (associated (keylist%first)) then
            call keyword_write_rec (keylist%first)
            write (unit, *)
        else
            write (unit, "(1x,A)") "[empty]"
        end if
    contains
        recursive subroutine keyword_write_rec (k_entry)
            type(keyword_entry_t), intent(in), pointer :: k_entry
            if (associated (k_entry)) then
                write (unit, "(1x,A)", advance="no") char (k_entry%string)
                call keyword_write_rec (k_entry%next)
            end if
        end subroutine keyword_write_rec
    end subroutine keyword_list_write_unit
```

Clear the keyword list

```
<Lexer: public>+≡
    public :: keyword_list_final

<Lexer: procedures>+≡
    subroutine keyword_list_final (keylist)
        type(keyword_list_t), intent(inout) :: keylist
        call keyword_destroy_rec (keylist%first)
        nullify (keylist%last)
    contains
        recursive subroutine keyword_destroy_rec (k_entry)
            type(keyword_entry_t), pointer :: k_entry
            if (associated (k_entry)) then
                call keyword_destroy_rec (k_entry%next)
                deallocate (k_entry)
            end if
        end subroutine keyword_destroy_rec
    end subroutine keyword_list_final
```

7.2.3 Lexeme templates

This type is handled like a rudimentary regular expression. It determines the lexer behavior when matching a string. The actual objects made from this type

and the corresponding matching routines are listed below.

```

<Lexer: types>+≡
  type :: template_t
  private
    integer :: type
    character(256) :: charset1, charset2
    integer :: len1, len2
  end type template_t

```

These are the types that valid lexemes can have:

```

<Lexer: public>+≡
  public :: T_KEYWORD, T_IDENTIFIER, T_QUOTED, T_NUMERIC

<Lexer: parameters>≡
  integer, parameter :: T_KEYWORD = 1
  integer, parameter :: T_IDENTIFIER = 2, T_QUOTED = 3, T_NUMERIC = 4

```

These are special types:

```

<Lexer: parameters>+≡
  integer, parameter :: EMPTY = 0, WHITESPACE = 10
  integer, parameter :: NO_MATCH = 11, IO_ERROR = 12, OVERFLOW = 13
  integer, parameter :: UNMATCHED_QUOTE = 14

```

In addition, we have EOF which is a negative integer, normally -1 . Printout for debugging:

```

<Lexer: procedures>+≡
  subroutine lexeme_type_write (type, unit)
    integer, intent(in) :: type
    integer, intent(in) :: unit
    select case (type)
      case (EMPTY);      write(unit,"(A)",advance="no") " EMPTY      "
      case (WHITESPACE); write(unit,"(A)",advance="no") " WHITESPACE "
      case (T_IDENTIFIER);write(unit,"(A)",advance="no") " IDENTIFIER "
      case (T_QUOTED);   write(unit,"(A)",advance="no") " QUOTED    "
      case (T_NUMERIC);  write(unit,"(A)",advance="no") " NUMERIC   "
      case (IO_ERROR);   write(unit,"(A)",advance="no") " IO_ERROR  "
      case (OVERFLOW);   write(unit,"(A)",advance="no") " OVERFLOW  "
      case (UNMATCHED_QUOTE); write(unit,"(A)",advance="no") " UNMATCHEDQ "
      case (NO_MATCH);   write(unit,"(A)",advance="no") " NO_MATCH  "
      case (EOF);        write(unit,"(A)",advance="no") " EOF       "
      case default;      write(unit,"(A)",advance="no") " [illegal]  "
    end select
  end subroutine lexeme_type_write

  subroutine template_write (tt, unit)
    type(template_t), intent(in) :: tt
    integer, intent(in) :: unit
    call lexeme_type_write (tt%type, unit)
    write (unit, "(A)", advance="no") " " // tt%charset1(1:tt%len1) // " "
    write (unit, "(A)", advance="no") " " // tt%charset2(1:tt%len2) // " "
  end subroutine template_write

```

The matching functions all return the number of matched characters in the provided string. If this number is zero, the match has failed.

The `template` functions are declared `pure` because they appear in `forall` loops below.

A template for whitespace:

```
<Lexer: procedures>+≡
pure function template_whitespace (chars) result (tt)
  character(*), intent(in) :: chars
  type(template_t) :: tt
  tt = template_t (WHITESPACE, chars, "", len (chars), 0)
end function template_whitespace
```

Just match the string against the character set.

```
<Lexer: procedures>+≡
subroutine match_whitespace (tt, s, n)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  n = verify (s, tt%charset1(1:tt%len1)) - 1
  if (n < 0) n = len (s)
end subroutine match_whitespace
```

A template for normal identifiers. To match, a lexeme should have a first character in class `chars1` and an arbitrary number of further characters in class `chars2`. If the latter is empty, we are looking for a single-character lexeme.

```
<Lexer: procedures>+≡
pure function template_identifier (chars1, chars2) result (tt)
  character(*), intent(in) :: chars1, chars2
  type(template_t) :: tt
  tt = template_t (T_IDENTIFIER, chars1, chars2, len(chars1), len(chars2))
end function template_identifier
```

Here, the first letter must match, the others may or may not.

```
<Lexer: procedures>+≡
subroutine match_identifier (tt, s, n)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  if (verify (s(1:1), tt%charset1(1:tt%len1)) == 0) then
    n = verify (s(2:), tt%charset2(1:tt%len2))
    if (n == 0) n = len (s)
  else
    n = 0
  end if
end subroutine match_identifier
```

A template for quoted strings. The same template applies for comments. The first character set indicates the left quote (could be a sequence of several characters), the second one the matching right quote.

```
<Lexer: procedures>+≡
pure function template_quoted (chars1, chars2) result (tt)
```

```

character(*), intent(in) :: chars1, chars2
type(template_t) :: tt
tt = template_t (T_QUOTED, chars1, chars2, len (chars1), len (chars2))
end function template_quoted

```

Here, the beginning of the string must exactly match the first character set, then we look for the second one. If found, return. If there is a first quote but no second one, return a negative number, indicating this error condition.

```

<Lexer: procedures>+≡
subroutine match_quoted (tt, s, n, range)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  integer, dimension(2), intent(out) :: range
  character(tt%len1) :: ch1
  character(tt%len2) :: ch2
  integer :: i
  ch1 = tt%charset1
  if (s(1:tt%len1) == ch1) then
    ch2 = tt%charset2
    do i = tt%len1 + 1, len (s) - tt%len2 + 1
      if (s(i:i+tt%len2-1) == ch2) then
        n = i + tt%len2 - 1
        range(1) = tt%len1 + 1
        range(2) = i - 1
        return
      end if
    end do
    n = -1
    range = 0
  else
    n = 0
    range = 0
  end if
end subroutine match_quoted

```

A template for real numbers. The first character set is the set of allowed exponent letters. In accordance with the other functions we return the lexeme as a string but do not read it.

```

<Lexer: procedures>+≡
pure function template_numeric (chars) result (tt)
  character(*), intent(in) :: chars
  type(template_t) :: tt
  tt = template_t (T_NUMERIC, chars, "", len (chars), 0)
end function template_numeric

```

A numeric lexeme may be real or integer. We purposely do not allow for a preceding sign. If the number is followed by an exponent, this is included, otherwise the rest is ignored.

There is a possible pitfall with this behavior: while the string `1e3` will be interpreted as a single number, the analogous string `1a3` will be split into the

number 1 and an identifier a3. There is no easy way around such an ambiguity. We should make sure that the syntax does not contain identifiers like a3 or e3.

(Lexer: procedures)+≡

```

subroutine match_numeric (tt, s, n)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  integer :: i, n0
  character(10), parameter :: digits = "0123456789"
  character(2), parameter :: signs = "-+"
  n = verify (s, digits) - 1
  if (n < 0) then
    n = 0
    return
  else if (s(n+1:n+1) == ".") then
    i = verify (s(n+2:), digits) - 1
    if (i < 0) then
      n = len (s)
      return
    else if (i > 0 .or. n > 0) then
      n = n + 1 + i
    end if
  end if
  n0 = n
  if (n > 0) then
    if (verify (s(n+1:n+1), tt%charset1(1:tt%len1)) == 0) then
      n = n + 1
      if (verify (s(n+1:n+1), signs) == 0) n = n + 1
      i = verify (s(n+1:), digits) - 1
      if (i < 0) then
        n = len (s)
      else if (i == 0) then
        n = n0
      else
        n = n + i
      end if
    end if
  end if
end subroutine match_numeric

```

The generic matching routine. With Fortran 2003 we would define separate types and use a SELECT TYPE instead.

(Lexer: procedures)+≡

```

subroutine match_template (tt, s, n, range)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  integer, dimension(2), intent(out) :: range
  select case (tt%type)
  case (WHITESPACE)
    call match_whitespace (tt, s, n)
    range = 0
  case (T_IDENTIFIER)

```

```

        call match_identifier (tt, s, n)
        range(1) = 1
        range(2) = len_trim (s)
    case (T_QUOTED)
        call match_quoted (tt, s, n, range)
    case (T_NUMERIC)
        call match_numeric (tt, s, n)
        range(1) = 1
        range(2) = len_trim (s)
    case default
        call msg_bug ("Invalid lexeme template encountered")
    end select
end subroutine match_template

```

Match against an array of templates. Return the index of the first template that matches together with the number of characters matched and the range of the relevant substring. If all fails, these numbers are zero.

(Lexer: procedures)+≡

```

subroutine match (tt, s, n, range, ii)
    type(template_t), dimension(:), intent(in) :: tt
    character(*), intent(in) :: s
    integer, intent(out) :: n
    integer, dimension(2), intent(out) :: range
    integer, intent(out) :: ii
    integer :: i
    do i = 1, size (tt)
        call match_template (tt(i), s, n, range)
        if (n /= 0) then
            ii = i
            return
        end if
    end do
    n = 0
    ii = 0
end subroutine match

```

7.2.4 The lexer setup

This object contains information about character classes. As said above, one class consists of quoting chars (matching left and right), another one of comment chars (similar), a class of whitespace, and several classes of characters that make up identifiers. When creating the lexer setup, the character classes are transformed into lexeme templates which are to be matched in a certain predefined order against the input stream.

BLANK should always be taken as whitespace, some things may depend on this. TAB is also fixed by convention, but may in principle be modified. Newline (DOS!) and linefeed are also defined as whitespace. The lexer setup, containing the list of lexeme templates. No defaults yet. The type with index zero will be assigned to the NO_MATCH lexeme.

The keyword list is not stored, just a pointer to it. We anticipate that the keyword list is part of the syntax table, and the lexer needs not alter it.

Furthermore, the lexer is typically finished before the syntax table is.

```

<Lexer: parameters>+=
    integer, parameter :: CASE_KEEP = 0, CASE_UP = 1, CASE_DOWN = 2

<Lexer: types>+=
    type :: lexer_setup_t
    private
    type(template_t), dimension(:), allocatable :: tt
    integer, dimension(:), allocatable :: type
    integer :: keyword_case = CASE_KEEP
    type(keyword_list_t), pointer :: keyword_list => null ()
end type lexer_setup_t

```

Fill the lexer setup object. Some things are hardcoded here (whitespace, alphanumeric identifiers), some are free: comment chars (but these must be single, and comments must be terminated by line-feed), quote chars and matches (must be single), characters to be read as one-character lexeme, special classes (characters of one class that should be glued together as identifiers).

```

<Lexer: procedures>+=
    subroutine lexer_setup_init (setup, &
        comment_chars, quote_chars, quote_match, &
        single_chars, special_class, &
        keyword_list, upper_case_keywords)
    type(lexer_setup_t), intent(inout) :: setup
    character(*), intent(in) :: comment_chars
    character(*), intent(in) :: quote_chars, quote_match
    character(*), intent(in) :: single_chars
    character(*), dimension(:), intent(in) :: special_class
    type(keyword_list_t), pointer :: keyword_list
    logical, intent(in), optional :: upper_case_keywords
    integer :: n, i
    if (present (upper_case_keywords)) then
        if (upper_case_keywords) then
            setup%keyword_case = CASE_UP
        else
            setup%keyword_case = CASE_DOWN
        end if
    else
        setup%keyword_case = CASE_KEEP
    end if
    n = 1 + len (comment_chars) + len (quote_chars) + 1 &
        + len (single_chars) + size (special_class) + 1
    allocate (setup%tt(n))
    allocate (setup%type(0:n))
    n = 0
    setup%type(n) = NO_MATCH
    n = n + 1
    setup%tt(n) = template_whitespace (WHITESPACE_CHARS)
    setup%type(n) = EMPTY
    forall (i = 1:len(comment_chars))
        setup%tt(n+i) = template_quoted (comment_chars(i:i), LF)
        setup%type(n+i) = EMPTY
    end forall
end subroutine

```

```

end forall
n = n + len (comment_chars)
forall (i = 1:len(quote_chars))
    setup%tt(n+i) = template_quoted (quote_chars(i:i), quote_match(i:i))
    setup%type(n+i) = T_QUOTED
end forall
n = n + len (quote_chars)
setup%tt(n+1) = template_numeric ("EeDd")
setup%type(n+1) = T_NUMERIC
n = n + 1
forall (i = 1:len (single_chars))
    setup%tt(n+i) = template_identifier (single_chars(i:i), "")
    setup%type(n+i) = T_IDENTIFIER
end forall
n = n + len (single_chars)
forall (i = 1:size (special_class))
    setup%tt(n+i) = template_identifier &
        (trim (special_class(i)), trim (special_class(i)))
    setup%type(n+i) = T_IDENTIFIER
end forall
n = n + size (special_class)
setup%tt(n+1) = template_identifier &
    (LCLETTERS//UCLETTERS, LCLETTERS//DIGITS//"_"/UCLETTERS)
setup%type(n+1) = T_IDENTIFIER
n = n + 1
if (n /= size (setup%tt)) &
    call msg_bug ("Size mismatch in lexer setup")
setup%keyword_list => keyword_list
end subroutine lexer_setup_init

```

The destructor is needed only if the object is not itself part of an allocatable array

```

<Lexer: procedures>+≡
subroutine lexer_setup_final (setup)
    type(lexer_setup_t), intent(inout) :: setup
    deallocate (setup%tt, setup%type)
    setup%keyword_list => null ()
end subroutine lexer_setup_final

```

For debugging: Write the lexer setup

```

<Lexer: procedures>+≡
subroutine lexer_setup_write (setup, unit)
    type(lexer_setup_t), intent(in) :: setup
    integer, intent(in) :: unit
    integer :: i
    write (unit, "(A)") "Lexer setup:"
    if (allocated (setup%tt)) then
        do i = 1, size (setup%tt)
            call template_write (setup%tt(i), unit)
            write (unit, '(A)', advance = "no") " -> "
            call lexeme_type_write (setup%type(i), unit)
            write (unit, *)
        end do
    end if
end subroutine lexer_setup_write

```

```

else
    write (unit, *) "[empty]"
end if
if (associated (setup%keyword_list)) then
    call keyword_list_write (setup%keyword_list, unit)
end if
end subroutine lexer_setup_write

```

7.2.5 The lexeme type

An object of this type is returned by the lexer. Apart from the lexeme string, it gives information about the relevant substring (first and last character index) and the lexeme type. Interpreting the string is up to the parser.

```

<Lexer: public>+≡
    public :: lexeme_t

<Lexer: types>+≡
    type :: lexeme_t
    private
        integer :: type = EMPTY
        type(string_t) :: s
        integer :: b = 0, e = 0
    end type lexeme_t

```

Debugging aid:

```

<Lexer: public>+≡
    public :: lexeme_write

<Lexer: procedures>+≡
    subroutine lexeme_write (t, unit)

    end function lexeme_is_eof

```

7.2.6 The lexer object

We store the current lexeme and the current line. The line buffer is set each time a new line is read from file. The working buffer has one character more,

to hold any trailing blank. Pointers to line and column are for debugging, they will be used to make up readable error messages for the parser.

```

<Lexer: public>+≡
    public :: lexer_t

<Lexer: types>+≡
    type :: lexer_t
        private
        type(lexer_setup_t) :: setup

    lexer%previous_line1 = ""
    lexer%current_line = ""
    lexer%lines_read = 0
    lexer%current_column = 0
    lexer%previous_column = 0
    lexer%buffer = ""
  end subroutine lexer_clear

```

Reset lexer state and delete setup

```

<Lexer: public>+≡
  public :: lexer_final

<Lexer: procedures>+≡
  subroutine lexer_final (lexer)
    type(lexer_t), intent(inout) :: lexer
    call lexer_clear (lexer)
    call lexer_setup_final (lexer%setup)
  end subroutine lexer_final

```

7.2.7 The lexer routine

For lexing we need to associate an input stream to the lexer.

```

<Lexer: public>+≡
  public :: lexer_assign_stream

<Lexer: procedures>+≡
  subroutine lexer_assign_stream (lexer, stream)
    type(lexer_t), intent(inout) :: lexer
    type(stream_t), intent(in), target :: stream
    lexer%stream => stream
  end subroutine lexer_assign_stream

```

The lexer. The lexer function takes the lexer and returns the currently stored lexeme. If there is none, it is read from buffer, matching against the lexeme templates in the lexer setup. Empty lexemes, i.e., comments and whitespace, are discarded and the buffer is read again until we have found a nonempty lexeme (which may also be EOF or an error condition).

The initial state of the lexer contains an empty lexeme, so reading from buffer is forced. The empty state is restored after returning the lexeme. A nonempty lexeme is present in the lexer only if `lex_back` has been executed before.

The workspace is the `lexer%buffer`, treated as a sort of input stream. We chop off lexemes from the beginning, adjusting the buffer to the left. Whenever the buffer is empty, or we are matching against an open quote which has not terminated, we read a new line and append it to the right. This may result in special conditions, which for simplicity are also returned as lexemes: I/O

error, buffer overflow, end of file. If the latter happens during reading a quoted string, we return an unmatched-quote lexeme. Obviously, the special-condition lexemes have to be caught by the parser.

Note that reading further lines is only necessary when reading a quoted string. Otherwise, the line-feed that ends each line is interpreted as whitespace which terminates a preceding lexeme, so there are no other valid multiline lexemes.

To enable meaningful error messages, we also keep track of the line number of the last line read, and the beginning and the end of the current lexeme with respect to this line.

The lexer is implemented as a function that returns the next lexeme (i.e., token). It uses the `lexer` setup and modifies the buffers and pointers stored within the lexer, a side effect. The lexer reads from an input stream object, which also is modified by this reading, e.g., a line pointer is advanced.

```

<Lexer: public>+≡
    public :: lex

<Lexer: procedures>+≡
    subroutine lex (lexeme, lexer)
        type(lexeme_t), intent(out) :: lexeme
        type(lexer_t), intent(inout) :: lexer
        integer :: iostat1, iostat2
        integer :: pos
        integer, dimension(2) :: range
        integer :: template_index, type
        if (.not. associated (lexer%stream)) &
            call msg_bug ("Lexer called without assigned stream")
        GET_LEXEME: do while (lexeme_get_type (lexer%lexeme) == EMPTY)
            if (len (lexer%buffer) /= 0) then
                iostat1 = 0
            else
                call lexer_read_line (lexer, iostat1)
            end if
            select case (iostat1)
            case (0)
                MATCH_BUFFER: do
                    call match (lexer%setup%tt, char (lexer%buffer), &
                                pos, range, template_index)
                    if (pos >= 0) then
                        type = lexer%setup%type(template_index)
                        exit MATCH_BUFFER
                    else
                        pos = 0
                        call lexer_read_line (lexer, iostat2)
                        select case (iostat2)
                        case (EOF); type = UNMATCHED_QUOTE; exit MATCH_BUFFER

                        case (2);  type = OVERFLOW;         exit MATCH_BUFFER
                        end select
                    end if
                end do MATCH_BUFFER
            case (EOF); type = EOF
            case (1);  type = IO_ERROR
        end do

```

```

        case (2);    type = OVERFLOW
    end select
    call lexeme_set (lexer%lexeme, lexer%setup%keyword_list, &
        extract (lexer%buffer, finish=pos), range, type, &
        lexer%setup%keyword_case)
    lexer%buffer = remove (lexer%buffer, finish=pos)
    lexer%previous_column = lexer%current_column
    lexer%current_column = lexer%current_column + pos
end do GET_LEXEME
lexeme = lexer%lexeme
call lexeme_clear (lexer%lexeme)
end subroutine lex

```

Read a line and append it to the input buffer. If the input buffer overflows, return `iostat=2`. Otherwise, `iostat=1` indicates an I/O error, and `iostat=-1` the EOF.

The input stream may either be an external unit or a `ifile` object. In the latter case, a line is read and the line pointer is advanced.

Note that inserting LF between input lines is the Unix convention. Since we are doing this explicitly when gluing lines together, we can pattern-match against LF without having to worry about the system.

```

<Lexer: procedures>+≡
subroutine lexer_read_line (lexer, iostat)
    type(lexer_t), intent(inout) :: lexer
    integer, intent(out) :: iostat
    type(string_t) :: current_line
    current_line = lexer%current_line
    call stream_get_record (lexer%stream, lexer%current_line, iostat)
    if (iostat == 0) then
        lexer%lines_read = lexer%lines_read + 1
        lexer%previous_line2 = lexer%previous_line1
        lexer%previous_line1 = current_line
        lexer%buffer = lexer%buffer // lexer%current_line // LF
        lexer%previous_column = 0
        lexer%current_column = 0
    end if
end subroutine lexer_read_line

```

Once in a while we have read one lexeme to many, which can be pushed back into the input stream. Do not do this more than once.

```

<Lexer: public>+≡
public :: lexer_put_back

<Lexer: procedures>+≡
subroutine lexer_put_back (lexer, lexeme)
    type(lexer_t), intent(inout) :: lexer
    type(lexeme_t), intent(in) :: lexeme
    if (lexeme_get_type (lexer%lexeme) == EMPTY) then
        lexer%lexeme = lexeme
    else
        call msg_bug (" Lexer: lex_back fails; probably called twice")
    end if
end subroutine lexer_put_back

```

7.2.8 Diagnostics

For debugging: print just the setup

```
<Lexer: public>+≡
  public :: lexer_write_setup

<Lexer: procedures>+≡
  subroutine lexer_write_setup (lexer, unit)
    type(lexer_t), intent(in) :: lexer
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    call lexer_setup_write (lexer%setup, u)
  end subroutine lexer_write_setup
```

This is useful for error printing: show the current line with index and a pointer to the current column within the line.

```
<Lexer: public>+≡
  public :: lexer_show_location

<Lexer: procedures>+≡
  subroutine lexer_show_location (lexer)
    type(lexer_t), intent(in) :: lexer
    type(string_t) :: loc_str
    if (associated (lexer%parent)) then
      call lexer_show_source (lexer%parent)
      call msg_message ("[includes]")
    else
      call msg_message ()
    end if
    if (associated (lexer%stream)) then
      call msg_message &
        (char (stream_get_record_info_string (lexer%stream)) // ":")
    end if
    if (lexer%lines_read >= 4) call msg_result ("[...]")
    if (lexer%lines_read >= 3) call msg_result (char (lexer%previous_line2))
    if (lexer%lines_read >= 2) call msg_result (char (lexer%previous_line1))
    if (lexer%lines_read >= 1) then
      call msg_result (char (lexer%current_line))
      loc_str = repeat (" ", lexer%previous_column)
      loc_str = loc_str // "^"
      if (lexer%current_column > lexer%previous_column) then
        loc_str = loc_str &
          // repeat ("-", max (lexer%current_column &
            - lexer%previous_column - 1, 0)) &
          // "^"
      end if
      call msg_result (char (loc_str))
    end if
  end subroutine lexer_show_location
```

This just prints the current stream source.

```
<Lexer: procedures>+≡
recursive subroutine lexer_show_source (lexer)
  type(lexer_t), intent(in) :: lexer
  if (associated (lexer%parent)) then
    call lexer_show_source (lexer%parent)
    call msg_message ("includes")
  else
    call msg_message ()
  end if
  if (associated (lexer%stream)) then
    call msg_message &
      (char (stream_get_source_info_string (lexer%stream)) // ":")
  end if
end subroutine lexer_show_source
```

7.2.9 Unit tests

```
<Lexer: public>+≡
public :: lexer_test

<Lexer: procedures>+≡
subroutine lexer_test (u, results)
  integer, intent(in) :: u
  type(test_results_t), intent(inout) :: results
<Lexer: execute tests>
end subroutine lexer_test
```

Test the lexer by lexing and printing all lexemes from unit `u`, one per line, using preset conventions.

```
<Lexer: execute tests>≡
call test (lexer_1, "lexer_1", &
  "check lexer", u, results)

<Lexer: tests>≡
subroutine lexer_1 (u)
  integer, intent(in) :: u
  type(lexer_t), target :: lexer
  type(stream_t), target :: stream
  type(string_t) :: string
  type(lexeme_t) :: lexeme
  string = "abcdefghij"
  call lexer_init (lexer, &
    comment_chars = "", &
    quote_chars = "<'\"", &
    quote_match = ">'\"", &
    single_chars = "?*+=,()", &
    special_class = ["."], &
    keyword_list = null ())
  call stream_init (stream, string)
  call lexer_assign_stream (lexer, stream)
  do
    call lex (lexeme, lexer)
```

```
        call lexeme_write (lexeme, u)
        if (lexeme_is_break (lexeme)) exit
    end do
    call stream_final (stream)
    call lexer_final (lexer)
end subroutine lexer_1
```

7.3 Syntax rules

This module provides tools to handle syntax rules in an abstract way.

```
<syntax_rules.f90>≡  
<File header>  
  
module syntax_rules  
  
  <Use strings>  
  use io_units  
  use diagnostics  
  use system_defs, only: LCLETTERS, UCLETTERS, DIGITS  
  use ifiles, only: line_p, line_init, line_get_string_advance, line_final  
  use ifiles, only: ifile_t, ifile_get_length  
  use lexers  
  
  <Standard module head>  
  
  <Syntax: public>  
  
  <Syntax: parameters>  
  
  <Syntax: types>  
  
  <Syntax: interfaces>  
  
  contains  
  
  <Syntax: subroutines>  
  
end module syntax_rules
```

7.3.1 Syntax rules

Syntax rules are used by the parser. They determine how to translate the stream of lexemes as returned by the lexer into the parse tree node. A rule may be terminal, i.e., replace a matching lexeme into a terminal node. The node will contain the lexeme interpreted as a recognized token:

- a keyword: unquoted fixed character string;
- a real number, to be determined at runtime;
- an integer, to be determined at runtime;
- a boolean value, to be determined at runtime;
- a quoted token (e.g., string), to be determined at runtime;
- an identifier (unquoted string that is not a recognized keyword), to be determined at runtime.

It may be nonterminal, i.e., contain a sequence of child rules. These are matched consecutively (and recursively) against the input stream; the resulting node will be a branch node.

- the file, i.e., the input stream as a whole;
- a sequence of syntax elements, where the last syntax element may be optional, or optional repetitive;

Sequences carry a flag that tells whether the last child is optional or may be repeated an arbitrary number of times, corresponding to the regexp modifiers `?`, `*`, and `+`.

We also need an alternative rule; this will be replaced by the node generated by one of its children that matches; thus, it does not create a node of its own.

- an alternative of syntax elements.

We also define special types of sequences as convenience macros:

- a list: a sequence where the elements are separated by a separator keyword (e.g., commas), the separators are thrown away when parsing the list;
- a group: a sequence of three tokens, where the first and third ones are left and right delimiters, the delimiters are thrown away;
- an argument list: a delimited list, containing both delimiters and separators.

It would be great to have a polymorphic type for this purpose, but until Fortran 2003 is out we have to emulate this.

Here are the syntax element codes:

```

<Syntax: public>≡
  public :: S_UNKNOWN
  public :: S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, S_QUOTED
  public :: S_IDENTIFIER, S_KEYWORD
  public :: S_SEQUENCE, S_LIST, S_GROUP, S_ARGS
  public :: S_ALTERNATIVE
  public :: S_IGNORE

<Syntax: parameters>≡
  integer, parameter :: &
    S_UNKNOWN = 0, &
    S_LOGICAL = 1, S_INTEGER = 2, S_REAL = 3, S_COMPLEX = 4, &
    S_QUOTED = 5, S_IDENTIFIER = 6, S_KEYWORD = 7, &
    S_SEQUENCE = 8, S_LIST = 9, S_GROUP = 10, S_ARGS = 11, &
    S_ALTERNATIVE = 12, &
    S_IGNORE = 99

```

We need arrays of rule pointers, therefore this construct.

```

<Syntax: types>≡
  type :: rule_p
  private
    type(syntax_rule_t), pointer :: p => null ()
  end type rule_p

```

Return the association status of the rule pointer:

```

<Syntax: subroutines>≡
  elemental function rule_is_associated (rp) result (ok)
    logical :: ok
    type (rule_p), intent(in) :: rp
    ok = associated (rp%p)
  end function rule_is_associated

```

The rule type is one of the types listed above, represented by an integer code. The keyword, for a non-keyword rule, is an identifier used for the printed syntax table. The array of children is needed for nonterminal rules. In that case, there is a modifier for the last element (blank, "?", "*", or "+"), mirrored in the flags **opt** and **rep**. Then, we have the character constants used as separators and delimiters for this rule. Finally, the **used** flag can be set to indicate that this rule is the child of another rule.

```

<Syntax: types>+≡
  public :: syntax_rule_t

<Syntax: types>+≡
  type :: syntax_rule_t
    private
    integer :: type = S_UNKNOWN
    logical :: used = .false.
    type(string_t) :: keyword
    type(string_t) :: separator
    type(string_t), dimension(2) :: delimiter
    type(rule_p), dimension(:), allocatable :: child
    character(1) :: modifier = ""
    logical :: opt = .false., rep = .false.
  end type syntax_rule_t

```

Initializer: Set type and key for a rule, but do not (yet) allocate anything.

Finalizer: not needed (no pointer components).

```

<Syntax: subroutines>+≡
  subroutine syntax_rule_init (rule, key, type)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), intent(in) :: key
    integer, intent(in) :: type
    rule%keyword = key
    rule%type = type
    select case (rule%type)
    case (S_GROUP)
      call syntax_rule_set_delimiter (rule)
    case (S_LIST)
      call syntax_rule_set_separator (rule)
    case (S_ARGS)
      call syntax_rule_set_delimiter (rule)
      call syntax_rule_set_separator (rule)
    end select
  end subroutine syntax_rule_init

```

These characters will not be enclosed in quotes when writing syntax rules:

```
<Syntax: parameters>+=
    character(*), parameter :: &
        UNQUOTED = "(),|_//LCLETTERS//UCLETTERS//DIGITS"
```

7.3.2 I/O

Write an account of the rule. Setting `short` true will suppress the node type. Setting `key_only` true will suppress the definition. Setting `advance` false will suppress the trailing newline.

```
<Syntax: public>+=
    public :: syntax_rule_write

<Syntax: subroutines>+=
    subroutine syntax_rule_write (rule, unit, short, key_only, advance)
        type(syntax_rule_t), intent(in) :: rule
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: short, key_only, advance
        logical :: typ, def, adv

end if
end subroutine write_sequence
end subroutine syntax_rule_write

```

In the printed representation, the keyword strings are enclosed as `<...>`, unless they are bare keywords. Bare keywords are enclosed as `'...'` if they contain a character which is not a letter, digit, or underscore. If they contain a single-quote character, they are enclosed as `".."`. (A keyword must not contain both single- and double-quotes.)

<Syntax: subroutines>+≡

```

function wkey (rule) result (string)
    type(string_t) :: string
    type(syntax_rule_t), intent(in) :: rule
    select case (rule%type)
    case (S_KEYWORD)
        if (verify (rule%keyword, UNQUOTED) == 0) then
            string = rule%keyword
        else if (scan (rule%keyword, "'") == 0) then
            string = "'" // rule%keyword // "'"
        else
            string = '"' // rule%keyword // '"'
        end if
    case default
        string = "<" // rule%keyword // ">"
    end select
end function wkey

```

7.3.3 Completing syntax rules

Set the separator and delimiter entries, using defaults:

<Syntax: subroutines>+≡

```

subroutine syntax_rule_set_separator (rule, separator)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), intent(in), optional :: separator
    if (present (separator)) then
        rule%separator = separator
    else
        rule%separator = ","
    end if
end subroutine syntax_rule_set_separator

subroutine syntax_rule_set_delimiter (rule, delimiter)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), dimension(2), intent(in), optional :: delimiter
    if (present (delimiter)) then
        rule%delimiter = delimiter
    else

```

```

        rule%delimiter = ["(", ")"]
    end if
end subroutine syntax_rule_set_delimiter

```

Set the modifier entry and corresponding flags:

(Syntax: subroutines)+≡

```

function is_modifier (string) result (ok)
    logical :: ok
    type(string_t), intent(in) :: string
    select case (char (string))
        case (" ", "?", "*", "+"); ok = .true.
        case default; ok = .false.
    end select
end function is_modifier

subroutine syntax_rule_set_modifier (rule, modifier)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), intent(in) :: modifier
    rule%modifier = char (modifier)
    select case (rule%modifier)
        case (" ")
        case ("?"); rule%opt = .true.
        case ("*"); rule%opt = .true.; rule%rep = .true.
        case ("+"); rule%rep = .true.
        case default
            call msg_bug (" Syntax: sequence modifier '" // rule%modifier &
                // "' is not one of '+', '*', '?'")
    end select
end subroutine syntax_rule_set_modifier

```

Check a finalized rule for completeness

(Syntax: subroutines)+≡

```

subroutine syntax_rule_check (rule)
    type(syntax_rule_t), intent(in) :: rule
    if (rule%keyword == "") call msg_bug ("Rule key not set")
    select case (rule%type)
        case (S_UNKNOWN); call bug (" Undefined rule")
        case (S_IGNORE, S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, &
            S_IDENTIFIER, S_KEYWORD)
        case (S_QUOTED)
            if (any (rule%delimiter == "")) call bug (" Missing quote character(s)")
        case (S_SEQUENCE)
        case (S_GROUP)
            if (any (rule%delimiter == "")) call bug (" Missing delimiter(s)")
        case (S_LIST)
            if (rule%separator == "") call bug (" Missing separator")
        case (S_ARGS)
            if (any (rule%delimiter == "")) call bug (" Missing delimiter(s)")
            if (rule%separator == "") call bug (" Missing separator")
        case (S_ALTERNATIVE)
        case default
            call bug (" Undefined syntax code")
    end select
end subroutine

```

```

select case (rule%type)
case (S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
  if (allocated (rule%child)) then
    if (.not.all (rule_is_associated (rule%child))) &
      call bug (" Child rules not all associated")
  else
    call bug (" Parent rule without children")
  end if
case default
  if (allocated (rule%child)) call bug (" Non-parent rule with children")
end select
contains
subroutine bug (string)
  character(*), intent(in) :: string
  call msg_bug (" Syntax table: Rule " // char (rule%keyword) // ": " &
    // string)
end subroutine bug
end subroutine syntax_rule_check

```

7.3.4 Accessing rules

This is the API for syntax rules:

<Syntax: public>+≡

```
public :: syntax_rule_get_type
```

<Syntax: subroutines>+≡

```
function syntax_rule_get_type (rule) result (type)
  integer :: type
  type(syntax_rule_t), intent(in) :: rule
  type = rule%type
end function syntax_rule_get_type

```

<Syntax: public>+≡

```
public :: syntax_rule_get_key
```

<Syntax: subroutines>+≡

```
function syntax_rule_get_key (rule) result (key)
  type(string_t) :: key
  type(syntax_rule_t), intent(in) :: rule
  key = rule%keyword
end function syntax_rule_get_key

```

<Syntax: public>+≡

```
public :: syntax_rule_get_separator
public :: syntax_rule_get_delimiter
```

<Syntax: subroutines>+≡

```
function syntax_rule_get_separator (rule) result (separator)
  type(string_t) :: separator
  type(syntax_rule_t), intent(in) :: rule
  separator = rule%separator
end function syntax_rule_get_separator

```

```

function syntax_rule_get_delimiter (rule) result (delimiter)
  type(string_t), dimension(2) :: delimiter
  type(syntax_rule_t), intent(in) :: rule
  delimiter = rule%delimiter
end function syntax_rule_get_delimiter

```

Accessing child rules. If we use `syntax_rule_get_n_sub` for determining loop bounds, we do not need a check in the second routine.

```

<Syntax: public>+≡
  public :: syntax_rule_get_n_sub
  public :: syntax_rule_get_sub_ptr

<Syntax: subroutines>+≡
function syntax_rule_get_n_sub (rule) result (n)
  integer :: n
  type(syntax_rule_t), intent(in) :: rule
  if (allocated (rule%child)) then
    n = size (rule%child)
  else
    n = 0
  end if
end function syntax_rule_get_n_sub

function syntax_rule_get_sub_ptr (rule, i) result (sub)
  type(syntax_rule_t), pointer :: sub
  type(syntax_rule_t), intent(in), target :: rule
  integer, intent(in) :: i
  sub => rule%child(i)%p
end function syntax_rule_get_sub_ptr

subroutine syntax_rule_set_sub (rule, i, sub)
  type(syntax_rule_t), intent(inout) :: rule
  integer, intent(in) :: i
  type(syntax_rule_t), intent(in), target :: sub
  rule%child(i)%p => sub
end subroutine syntax_rule_set_sub

```

Return the modifier flags:

```

<Syntax: public>+≡
  public :: syntax_rule_last_optional
  public :: syntax_rule_last_repetitive

<Syntax: subroutines>+≡
function syntax_rule_last_optional (rule) result (opt)
  logical :: opt
  type(syntax_rule_t), intent(in) :: rule
  opt = rule%opt
end function syntax_rule_last_optional
function syntax_rule_last_repetitive (rule) result (rep)
  logical :: rep
  type(syntax_rule_t), intent(in) :: rule
  rep = rule%rep
end function syntax_rule_last_repetitive

```

Return true if the rule is atomic, i.e., logical, real, keyword etc.

```
<Syntax: public>+≡
    public :: syntax_rule_is_atomic

<Syntax: subroutines>+≡
    function syntax_rule_is_atomic (rule) result (atomic)
        logical :: atomic
        type(syntax_rule_t), intent(in) :: rule
        select case (rule%type)
            case (S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, S_IDENTIFIER, &
                 S_KEYWORD, S_QUOTED)
                atomic = .true.
            case default
                atomic = .false.
        end select
    end function syntax_rule_is_atomic
```

7.3.5 Syntax tables

A syntax table contains the tree of syntax rules and, for direct parser access, the list of valid keywords.

Types

The syntax contains an array of rules and a list of keywords. The array is actually used as a tree, where the top rule is the first array element, and the other rules are recursively pointed to by this first rule. (No rule should be used twice or be unused.) The keyword list is derived from the rule tree.

Objects of this type need the target attribute if they are associated with a lexer. The keyword list will be pointed to by this lexer.

```
<Syntax: public>+≡
    public :: syntax_t

<Syntax: types>+≡
    type :: syntax_t
        private
        type(syntax_rule_t), dimension(:), allocatable :: rule
        type(keyword_list_t) :: keyword_list
    end type syntax_t
```

Constructor/destructor

Initialize and finalize syntax tables

```
<Syntax: public>+≡
    public :: syntax_init
    public :: syntax_final
```

There are two ways to create a syntax: hard-coded from rules or dynamically from file.

```

<Syntax: interfaces>≡
interface syntax_init
  module procedure syntax_init_from_ifile
end interface

```

The syntax definition is read from an ifile object which contains the syntax definitions in textual form, one rule per line. This interface allows for determining the number of rules beforehand.

To parse the rule definitions, we make up a temporary lexer. Obviously, we cannot use a generic parser yet, so we have to hardcode the parsing process.

```

<Syntax: subroutines>+≡
subroutine syntax_init_from_ifile (syntax, ifile)
  type(syntax_t), intent(out), target :: syntax
  type(ifile_t), intent(in) :: ifile
  type(lexer_t) :: lexer
  type(line_p) :: line
  type(string_t) :: string
  integer :: n_token
  integer :: i
  call lexer_init (lexer, &
    comment_chars = "", &
    quote_chars = "<'\""", &
    quote_match = ">'\""", &
    single_chars = "?*+|=,()", &
    special_class = ["."], &
    keyword_list = null ())
  allocate (syntax%rule (ifile_get_length (ifile)))
  call line_init (line, ifile)
  do i = 1, size (syntax%rule)
    string = line_get_string_advance (line)
    call set_rule_type_and_key (syntax%rule(i), string, lexer)
  end do
  call line_init (line, ifile)
  do i = 1, size (syntax%rule)
    string = line_get_string_advance (line)
    select case (syntax%rule(i)%type)
    case (S_QUOTED, S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
      n_token = get_n_token (string, lexer)
      call set_rule_contents &
        (syntax%rule(i), syntax, n_token, string, lexer)
    end select
  end do
  call line_final (line)
  call lexer_final (lexer)
  call syntax_make_keyword_list (syntax)
  if (.not. all (syntax%rule%used)) then
    do i = 1, size (syntax%rule)
      if (.not. syntax%rule(i)%used) then
        call syntax_rule_write (syntax%rule(i), 6)
      end if
    end do
  end if
end do

```

```

        call msg_bug (" Syntax table: unused rules")
    end if
end subroutine syntax_init_from_ifile

```

For a given rule defined in the input, the first task is to determine its type and key. With these, we can initialize the rule in the table, postponing the association of children.

```

<Syntax: subroutines>+=
subroutine set_rule_type_and_key (rule, string, lexer)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), intent(in) :: string
    type(lexer_t), intent(inout) :: lexer
    type(stream_t), target :: stream
    type(lexeme_t) :: lexeme
    type(string_t) :: key
    character(2) :: type
    call lexer_clear (lexer)
    call stream_init (stream, string)
    call lexer_assign_stream (lexer, stream)
    call lex (lexeme, lexer)
    type = lexeme_get_string (lexeme)
    call lex (lexeme, lexer)
    key = lexeme_get_contents (lexeme)
    call stream_final (stream)
    if (trim (key) /= "") then
        select case (type)
            case ("IG"); call syntax_rule_init (rule, key, S_IGNORE)
            case ("LO"); call syntax_rule_init (rule, key, S_LOGICAL)

            case ("ID"); call syntax_rule_init (rule, key, S_IDENTIFIER)
            case ("KE"); call syntax_rule_init (rule, key, S_KEYWORD)
            case ("QU"); call syntax_rule_init (rule, key, S_QUOTED)
            case ("SE"); call syntax_rule_init (rule, key, S_SEQUENCE)
            case ("GR"); call syntax_rule_init (rule, key, S_GROUP)
            case ("LI"); call syntax_rule_init (rule, key, S_LIST)
            case ("AR"); call syntax_rule_init (rule, key, S_ARGS)
            case ("AL"); call syntax_rule_init (rule, key, S_ALTERNATIVE)
            case default
                call lexer_show_location (lexer)
                call msg_bug (" Syntax definition: unknown type '" // type // "'")
            end select
        else
            print *, char (string)
            call msg_bug (" Syntax definition: empty rule key")
        end if
    end subroutine set_rule_type_and_key

```

This function returns the number of tokens in an input line.

```

<Syntax: subroutines>+=
function get_n_token (string, lexer) result (n)
    integer :: n

```

```

type(string_t), intent(in) :: string
type(lexer_t), intent(inout) :: lexer
type(stream_t), target :: stream
type(lexeme_t) :: lexeme
integer :: i
call lexer_clear (lexer)
call stream_init (stream, string)
call lexer_assign_stream (lexer, stream)
i = 0
do
    call lex (lexeme, lexer)
    if (lexeme_is_break (lexeme)) exit
    i = i + 1
end do
n = i
call stream_final (stream)
end function get_n_token

```

This subroutine extracts the rule contents for an input line. There are three tasks: (1) determine the number of children, depending on the rule type; (2) find and set the separator and delimiter strings, if required; (3) scan the child rules, find them in the syntax table and associate the parent rule with them.

(*Syntax: subroutines*)+≡

```

subroutine set_rule_contents (rule, syntax, n_token, string, lexer)

```

This routine completes the syntax table object. We assume that the rule array is set up. We associate the top rule with the first entry in the rule array and build up the keyword list.

The keyword list includes delimiters and separators. Filling it can only be done after all rules are set. We scan the rule tree. For each keyword that we find, we try to add it to the keyword list; the pointer to the last element is carried along with the recursive scanning. Before appending a keyword, we check whether it is already in the list.

(Syntax: subroutines)+≡

```

subroutine syntax_make_keyword_list (syntax)
  type(syntax_t), intent(inout), target :: syntax
  type(syntax_rule_t), pointer :: rule
  rule => syntax%rule(1)
  call rule_scan_rec (rule, syntax%keyword_list)
contains
  recursive subroutine rule_scan_rec (rule, keyword_list)
    type(syntax_rule_t), pointer :: rule
    type(keyword_list_t), intent(inout) :: keyword_list
    integer :: i
    if (rule%used) return
    rule%used = .true.

```

```

select case (rule%type)
case (S_UNKNOWN)

            end if
        end do
        call msg_bug (" Syntax table: Rule " // char (key) // " not found")
    end function syntax_get_rule_ptr

```

Return a pointer to the keyword list

```

<Syntax: public>+≡
    public :: syntax_get_keyword_list_ptr

<Syntax: subroutines>+≡
    function syntax_get_keyword_list_ptr (syntax) result (keyword_list)
        type(keyword_list_t), pointer :: keyword_list
        type(syntax_t), intent(in), target :: syntax
        keyword_list => syntax%keyword_list
    end function syntax_get_keyword_list_ptr

```

7.3.7 I/O

Write a readable representation of the syntax table

```

<Syntax: public>+≡
    public :: syntax_write

<Syntax: subroutines>+≡
    subroutine syntax_write (syntax, unit)
        type(syntax_t), intent(in) :: syntax
        integer, intent(in), optional :: unit
        integer :: u
        integer :: i
        u = given_output_unit (unit); if (u < 0) return
        write (u, "(A)") "Syntax table:"
        if (allocated (syntax%rule)) then
            do i = 1, size (syntax%rule)
                call syntax_rule_write (syntax%rule(i), u)
            end do
        end if
    end subroutine syntax_write

```

```
        end do
    else
        write (u, "(1x,A)") "[not allocated]"
    end if
    call keyword_list_write (syntax%keyword_list, u)
end subroutine syntax_write
```

7.4 The parser

On a small scale, the parser interprets the string tokens returned by the lexer; they are interpreted as numbers, keywords and such and stored as a typed object. On a large scale, a text is read, parsed, and a syntax rule set is applied such that the tokens are stored as a parse tree. Syntax errors are spotted in this process, so the resulting parse tree is syntactically correct by definition.

```
<parser.f90>≡  
  <File header>  
  
  module parser  
  
    <Use kinds>  
    <Use strings>  
    use io_units  
    use format_defs, only: FMT_19  
    use unit_tests  
    use system_defs, only: DIGITS  
    use diagnostics  
    use md5  
    use lexers  
    use syntax_rules  
  
    <Standard module head>  
  
    <Parser: public>  
  
    <Parser: types>  
  
    <Parser: interfaces>  
  
    contains  
  
    <Parser: procedures>  
  
    <Parser: tests>  
  
  end module parser
```

7.4.1 The token type

Tokens are elements of the parsed input that carry a value: logical, integer, real, quoted string, (unquoted) identifier, or known keyword. Note that non-keyword tokens also have an abstract key attached to them.

This is an obvious candidate for polymorphism.

```
<Parser: types>≡  
  type :: token_t  
    private  
    integer :: type = S_UNKNOWN  
    logical, pointer :: lval => null ()  
    integer, pointer :: ival => null ()  
    real(default), pointer :: rval => null ()
```

```

        complex(default), pointer :: cval => null ()
        type(string_t), pointer :: sval => null ()
        type(string_t), pointer :: kval => null ()
        type(string_t), dimension(:), pointer :: quote => null ()
    end type token_t

```

Create a token from the lexeme returned by the lexer: Allocate storage and try to interpret the lexeme according to the type that is requested by the parser. For a keyword token, match the lexeme against the requested key. If successful, set the token type, value, and key. Otherwise, set the type to S_UNKNOWN.

(Parser: procedures)≡

```

subroutine token_init (token, lexeme, requested_type, key)
    type(token_t), intent(out) :: token
    type(lexeme_t), intent(in) :: lexeme
    integer, intent(in) :: requested_type

  call token_write (token)
  call msg_bug (" Token type mismatch; value required as " // type)
end subroutine token_mismatch

```

7.4.3 The parse tree: nodes

The parser will generate a parse tree from the input stream. Each node in this parse tree points to the syntax rule that was applied. (Since syntax rules are stored in a pointer-type array within the syntax table, they qualify as targets.) A leaf node contains a token. A branch node has subnodes. The subnodes are stored as a list, so each node also has a `next` pointer.

```

<Parser: public>≡
public :: parse_node_t

<Parser: types>+≡
type :: parse_node_t
private
  type(syntax_rule_t), pointer :: rule => null ()
  type(token_t) :: token
  integer :: n_sub = 0
  type(parse_node_t), pointer :: sub_first => null ()
  type(parse_node_t), pointer :: sub_last => null ()
  type(parse_node_t), pointer :: next => null ()
contains
  <Parser: parse node: TBP>
end type parse_node_t

```

Container for parse node pointers, useful for creating pointer arrays:

```

<Parser: public>+≡
public :: parse_node_p

<Parser: types>+≡
type :: parse_node_p
  type(parse_node_t), pointer :: ptr => null ()
end type parse_node_p

```

Output. The first version writes a node together with its sub-node tree, organized by indentation.

```

(Parser: parse node: TBP)≡
    procedure :: write => parse_node_write_rec

(Parser: public)+≡
    public :: parse_node_write_rec

(Parser: procedures)+≡
    recursive subroutine parse_node_write_rec (node, unit, short, depth)

        d = 0; if (present (depth)) d = depth
        call parse_node_write (node, u, short=short)
        current => node%sub_first
        do while (associated (current))
            write (u, "(A)", advance = "no") repeat ("| ", d)
            call parse_node_write_rec (current, unit, short, d+1)
            current => current%next
        end do
    end subroutine parse_node_write_rec

```

This does the actual output for a single node, without recursion.

```

(Parser: public)+≡
    public :: parse_node_write

(Parser: procedures)+≡
    subroutine parse_node_write (node, unit, short)
        class(parse_node_t), intent(in) :: node
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: short
        integer :: u
        type(parse_node_t), pointer :: current
        u = given_output_unit (unit); if (u < 0) return
        write (u, "(' + ')", advance = "no")
        if (associated (node%rule)) then
            call syntax_rule_write (node%rule, u, &
                short=short, key_only=.true., advance=.false.)
        if (token_is_valid (node%token)) then
            write (u, "(' = ')", advance="no")
            call token_write (node%token, u)
        else if (associated (node%sub_first)) then
            write (u, "(' = ')", advance="no")
            current => node%sub_first
            do while (associated (current))
                call syntax_rule_write (current%rule, u, &
                    short=.true., key_only=.true., advance=.false.)
                current => current%next
            end do
        write (u, *)
    end subroutine parse_node_write

```

```

        else
            write (u, *)
        end if
    else
        write (u, *) "[empty]"
    end if
end subroutine parse_node_write

```

Finalize the token and recursively finalize and deallocate all sub-nodes.

```

<Parser: public>+≡
    public :: parse_node_final

<Parser: procedures>+≡
    recursive subroutine parse_node_final (node, recursive)
        type(parse_node_t), intent(inout) :: node
        type(parse_node_t), pointer :: current
        logical, intent(in), optional :: recursive
        logical :: rec
        rec = .true.; if (present (recursive)) rec = recursive
        call token_final (node%token)
        if (rec) then
            do while (associated (node%sub_first))
                current => node%sub_first
                node%sub_first => node%sub_first%next
                call parse_node_final (current)
                deallocate (current)
            end do
        end if
    end subroutine parse_node_final

```

7.4.4 Filling nodes

The constructors allocate and initialize the node. There are two possible initializers (in a later version, should correspond to different type extensions).

First, leaf (terminal) nodes. The token constructor does the actual work, looking at the requested type and key for the given rule and matching against the lexeme contents. If it fails, the token will keep the type `S_UNKNOWN` and remain empty. Otherwise, we have a valid node which contains the new token.

If the lexeme argument is absent, the token is left empty.

```

<Parser: procedures>+≡
    subroutine parse_node_create_leaf (node, rule, lexeme)
        type(parse_node_t), pointer :: node
        type(syntax_rule_t), intent(in), target :: rule
        type(lexeme_t), intent(in) :: lexeme
        allocate (node)
        node%rule => rule
        call token_init (node%token, lexeme, &
            syntax_rule_get_type (rule), syntax_rule_get_key (rule))
        if (.not. token_is_valid (node%token)) deallocate (node)
    end subroutine parse_node_create_leaf

```

This version allows us to manually create a leaf node that holds a keyword.

```

(Parser: public)+≡
    public :: parse_node_create_key

(Parser: procedures)+≡
    subroutine parse_node_create_key (node, rule)
        type(parse_node_t), intent(out) :: node
        type(syntax_rule_t), intent(in), target :: rule
        node%rule => rule
        call token_init_key (node%token, syntax_rule_get_key (rule))
    end subroutine parse_node_create_key

```

This version allows us to manually create a leaf node that holds a fixed value.
Only one of the optional values should be provided.

```

(Parser: public)+≡
    public :: parse_node_create_value

(Parser: procedures)+≡
    subroutine parse_node_create_value (node, rule, ival, rval, cval, sval, lval)
        type(parse_node_t), intent(out) :: node
        type(syntax_rule_t), intent(in), target :: rule
        integer, intent(in), optional :: ival
        real(default), intent(in), optional :: rval
        complex(default), intent(in), optional :: cval
        type(string_t), intent(in), optional :: sval
        logical, intent(in), optional :: lval
        node%rule => rule
        call parse_node_set_value (node, ival, rval, cval, sval, lval)
    end subroutine parse_node_create_value

```

Directly set the value without changing anything else.

```

(Parser: public)+≡
    public :: parse_node_set_value

(Parser: procedures)+≡
    subroutine parse_node_set_value (node, ival, rval, cval, sval, lval)
        type(parse_node_t), intent(inout) :: node
        integer, intent(in), optional :: ival
        real(default), intent(in), optional :: rval
        complex(default), intent(in), optional :: cval
        type(string_t), intent(in), optional :: sval
        logical, intent(in), optional :: lval
        if (present (ival)) then
            node%token = ival
        else if (present (rval)) then
            node%token = rval
        else if (present (cval)) then
            node%token = cval
        else if (present (lval)) then
            node%token = lval
        else if (present (sval)) then
            node%token = sval
        end if
    end subroutine parse_node_set_value

```

Second, branch nodes. We first assign the rule:

```

(Parser: public)+≡
    public :: parse_node_create_branch

(Parser: procedures)+≡
    subroutine parse_node_create_branch (node, rule)
        type(parse_node_t), pointer :: node
        type(syntax_rule_t), intent(in), target :: rule
        allocate (node)
        node%rule => rule
    end subroutine parse_node_create_branch

```

Append a sub-node. The sub-node must exist and be a valid target, otherwise nothing is done.

```

(Parser: public)+≡
    public :: parse_node_append_sub

(Parser: procedures)+≡
    subroutine parse_node_append_sub (node, sub)
        type(parse_node_t), intent(inout) :: node
        type(parse_node_t), pointer :: sub
        if (associated (sub)) then
            if (associated (node%sub_last)) then
                node%sub_last%next => sub
            else
                node%sub_first => sub
            end if
            node%sub_last => sub
        end if
    end subroutine parse_node_append_sub

```

For easy access, once the list is complete we count the number of sub-nodes. If there are no subnodes, the whole node is deleted.

```

(Parser: public)+≡
    public :: parse_node_freeze_branch

(Parser: procedures)+≡
    subroutine parse_node_freeze_branch (node)
        type(parse_node_t), pointer :: node
        type(parse_node_t), pointer :: current
        node%n_sub = 0
        current => node%sub_first
        do while (associated (current))
            node%n_sub = node%n_sub + 1
            current => current%next
        end do
        if (node%n_sub == 0) deallocate (node)
    end subroutine parse_node_freeze_branch

```

Replace the syntax rule. This makes sense only if the parse node adheres to the syntax of the new rule.

```

(Parser: public)+≡
    public :: parse_node_replace_rule

```

```

(Parser: procedures)+≡
  subroutine parse_node_replace_rule (node, rule)
    type(parse_node_t), pointer :: node
    type(syntax_rule_t), intent(in), target :: rule
    node%rule => rule
  end subroutine parse_node_replace_rule

```

Replace the last subnode by the target node. Since the subnodes are stored as a linked list, we can do this only if we copy the subnodes. Furthermore, the target node must also be copied, and the `next` pointer of the copy is nullified. This ensures that we cannot modify the originals at the subnode level.

All copies are shallow copies. This implies that further modifications at the sub-subnode level will affect the original nodes and must therefore be forbidden.

Use with care, this invites to memory mismanagement. The copy nodes can be deallocated, but not finalized, since its subnodes are the same objects as the subnodes of the target node.

```

(Parser: public)+≡
  public :: parse_node_replace_last_sub

(Parser: procedures)+≡
  subroutine parse_node_replace_last_sub (node, pn_target)
    type(parse_node_t), intent(inout), target :: node
    type(parse_node_t), intent(in), target :: pn_target
    type(parse_node_t), pointer :: current, current_copy, previous
    integer :: i
    select case (node%n_sub)
    case (1)
      allocate (current_copy)
      current_copy = pn_target
      node%sub_first => current_copy
    case (2:)
      current => node%sub_first
      allocate (current_copy)
      current_copy = current
      node%sub_first => current_copy
      previous => current_copy
      do i = 1, node%n_sub - 2
        current => current%next
        allocate (current_copy)
        current_copy = current
        previous%next => current_copy
        previous => current_copy
      end do
      allocate (current_copy)
      current_copy = pn_target
      previous%next => current_copy
    case default
      call parse_node_write (node)
      call msg_bug ("replace_last_sub' called for non-branch parse node")
    end select
    current_copy%next => null ()
    node%sub_last => current_copy
  end subroutine parse_node_replace_last_sub

```

7.4.5 Accessing nodes

Return the node contents. Check if pointers are associated. No check when accessing a sub-node; assume that `parse_node_n_sub` is always used for the upper bound.

The token extractor returns a pointer.

<Parser: public>+≡

```
public :: parse_node_get_rule_ptr
public :: parse_node_get_n_sub
public :: parse_node_get_sub_ptr
public :: parse_node_get_next_ptr
public :: parse_node_get_last_sub_ptr
```

<Parser: procedures>+≡

```
function parse_node_get_rule_ptr (node) result (rule)
  type(syntax_rule_t), pointer :: rule
  type(parse_node_t), intent(in), target :: node
  if (associated (node%rule)) then
    rule => node%rule
  else
    rule => null ()
    call parse_node_undefined (node, "rule")
  end if
end function parse_node_get_rule_ptr
```

```
function parse_node_get_n_sub (node) result (n)
  integer :: n
  type(parse_node_t), intent(in) :: node
  n = node%n_sub
end function parse_node_get_n_sub
```

```
function parse_node_get_sub_ptr (node, n, tag, required) result (sub)
  type(parse_node_t), pointer :: sub
  type(parse_node_t), intent(in), target :: node
  integer, intent(in), optional :: n
  character(*), intent(in), optional :: tag
  logical, intent(in), optional :: required
  integer :: i
  sub => node%sub_first
  if (present (n)) then
    do i = 2, n
      if (associated (sub)) then
        sub => sub%next
      else
        return
      end if
    end do
  end if
  call parse_node_check (sub, tag, required)
end function parse_node_get_sub_ptr
```

```
function parse_node_get_next_ptr (sub, n, tag, required) result (next)
```

```

type(parse_node_t), pointer :: next
type(parse_node_t), intent(in), target :: sub
integer, intent(in), optional :: n
character(*), intent(in), optional :: tag
logical, intent(in), optional :: required
integer :: i
next => sub%next
if (present (n)) then
    do i = 2, n
        if (associated (next)) then
            next => next%next
        else
            exit
        end if
    end do
end if
call parse_node_check (next, tag, required)
end function parse_node_get_next_ptr

function parse_node_get_last_sub_ptr (node, tag, required) result (sub)
type(parse_node_t), pointer :: sub
type(parse_node_t), intent(in), target :: node
character(*), intent(in), optional :: tag
logical, intent(in), optional :: required
sub => node%sub_last
call parse_node_check (sub, tag, required)
end function parse_node_get_last_sub_ptr

(Parser: procedures)+≡
subroutine parse_node_undefined (node, obj)
type(parse_node_t), intent(in) :: node
character(*), intent(in) :: obj
call parse_node_write (node, 6)
call msg_bug (" Parse-tree node: " // obj // " requested, but undefined")
end subroutine parse_node_undefined

```

Check if a parse node has a particular tag, and if it is associated:

```

(Parser: public)+≡
public :: parse_node_check

(Parser: procedures)+≡
subroutine parse_node_check (node, tag, required)
type(parse_node_t), pointer :: node
character(*), intent(in), optional :: tag
logical, intent(in), optional :: required
if (associated (node)) then
    if (present (tag)) then
        if (parse_node_get_rule_key (node) /= tag) &
            call parse_node_mismatch (tag, node)
        end if
    else
        if (present (required)) then
            if (required) &
                call msg_bug (" Missing node, expected <" // tag // ">")
        end if
    end if
end subroutine parse_node_check

```

```

        end if
    end if
end subroutine parse_node_check

```

This is called by a parse-tree scanner if the expected and the actual nodes do not match

```

(Parser: public)+≡
    public :: parse_node_mismatch

(Parser: procedures)+≡
    subroutine parse_node_mismatch (string, parse_node)
        character(*), intent(in) :: string
        type(parse_node_t), intent(in) :: parse_node
        call parse_node_write (parse_node)
        call msg_bug (" Syntax mismatch, expected <" // string // ">.")
    end subroutine parse_node_mismatch

```

The following functions are wrappers for extracting the token contents.

```

(Parser: public)+≡
    public :: parse_node_get_logical
    public :: parse_node_get_integer
    public :: parse_node_get_real
    public :: parse_node_get_cmplx
    public :: parse_node_get_string
    public :: parse_node_get_key
    public :: parse_node_get_rule_key

(Parser: procedures)+≡
    function parse_node_get_logical (node) result (lval)
        logical :: lval
        type(parse_node_t), intent(in), target :: node
        lval = token_get_logical (parse_node_get_token_ptr (node))
    end function parse_node_get_logical

    function parse_node_get_integer (node) result (ival)
        integer :: ival
        type(parse_node_t), intent(in), target :: node
        ival = token_get_integer (parse_node_get_token_ptr (node))
    end function parse_node_get_integer

    function parse_node_get_real (node) result (rval)
        real(default) :: rval
        type(parse_node_t), intent(in), target :: node
        rval = token_get_real (parse_node_get_token_ptr (node))
    end function parse_node_get_real

    function parse_node_get_cmplx (node) result (cval)
        complex(default) :: cval
        type(parse_node_t), intent(in), target :: node
        cval = token_get_cmplx (parse_node_get_token_ptr (node))
    end function parse_node_get_cmplx

    function parse_node_get_string (node) result (sval)
        type(string_t) :: sval

```

```

    type(parse_node_t), intent(in), target :: node
    sval = token_get_string (parse_node_get_token_ptr (node))
end function parse_node_get_string

function parse_node_get_key (node) result (kval)
    type(string_t) :: kval
    type(parse_node_t), intent(in), target :: node
    kval = token_get_key (parse_node_get_token_ptr (node))
end function parse_node_get_key

function parse_node_get_rule_key (node) result (kval)
    type(string_t) :: kval
    type(parse_node_t), intent(in), target :: node
    kval = syntax_rule_get_key (parse_node_get_rule_ptr (node))
end function parse_node_get_rule_key

function parse_node_get_token_ptr (node) result (token)
    type(token_t), pointer :: token
    type(parse_node_t), intent(in), target :: node
    if (token_is_valid (node%token)) then
        token => node%token
    else
        call parse_node_undefined (node, "token")
    end if
end function parse_node_get_token_ptr

```

Return a MD5 sum for a parse node. The method is to write the node to a scratch file and to evaluate the MD5 sum of that file.

```

<Parser: public>+≡
    public :: parse_node_get_md5sum

<Parser: procedures>+≡
    function parse_node_get_md5sum (pn) result (md5sum_pn)
        character(32) :: md5sum_pn
        type(parse_node_t), intent(in) :: pn
        integer :: u
        u = free_unit ()
        open (unit = u, status = "scratch", action = "readwrite")
        call parse_node_write_rec (pn, unit=u)
        rewind (u)
        md5sum_pn = md5sum (u)
        close (u)
    end function parse_node_get_md5sum

```

7.4.6 The parse tree

The parse tree is a tree of nodes, where leaf nodes hold a valid token, while branch nodes point to a list of sub-nodes.

```

<Parser: public>+≡
    public :: parse_tree_t

```

```

(Parser: types)+≡
    type :: parse_tree_t
    private
        type(parse_node_t), pointer :: root_node => null ()
    end type parse_tree_t

```

The parser. Its arguments are the parse tree (which should be empty initially), the lexer (which should be already set up), the syntax table (which should be valid), and the input stream. The input stream is completely parsed, using the lexer setup and the syntax rules as given, and the parse tree is built accordingly.

If `check_eof` is absent or true, the parser will complain about trailing garbage. Otherwise, it will ignore it.

By default, the input stream is matched against the top rule in the specified syntax. If `key` is given, it is matched against the rule with the specified key instead.

Failure at the top level means that no rule could match at all; in this case the error message will show the top rule.

```

(Parser: public)+≡
    public :: parse_tree_init

(Parser: procedures)+≡
    subroutine parse_tree_init &
        (parse_tree, syntax, lexer, key, check_eof)
        type(parse_tree_t), intent(inout) :: parse_tree
        type(lexer_t), intent(inout) :: lexer
        type(syntax_t), intent(in), target :: syntax
        type(string_t), intent(in), optional :: key
        logical, intent(in), optional :: check_eof
        type(syntax_rule_t), pointer :: rule
        type(lexeme_t) :: lexeme
        type(parse_node_t), pointer :: node
        logical :: ok, check
        check = .true.; if (present (check_eof)) check = check_eof
        call lexer_clear (lexer)
        if (present (key)) then
            rule => syntax_get_rule_ptr (syntax, key)
        else
            rule => syntax_get_top_rule_ptr (syntax)
        end if
        if (associated (rule)) then
            call parse_node_match_rule (node, rule, ok)
            if (ok) then
                parse_tree%root_node => node
            else
                call parse_error (rule, lexeme)
            end if
        end if
        if (check) then
            call lex (lexeme, lexer)
            if (.not. lexeme_is_eof (lexeme)) then
                call lexer_show_location (lexer)
                call msg_fatal (" Syntax error " &
                    // "(at or before the location indicated above)")
            end if
        end if
    end subroutine parse_tree_init

```

```

        end if
    else
        call msg_bug (" Parser failed because syntax is empty")
    end if
contains
    <Parser: internal subroutines of parse_tree_init>
end subroutine parse_tree_init

```

The parser works recursively, following the rule tree, building the tree of nodes on the fly. If the given rule matches, the node is filled on return. If not, the node remains empty.

```

<Parser: internal subroutines of parse_tree_init>≡
recursive subroutine parse_node_match_rule (node, rule, ok)
    type(parse_node_t), pointer :: node
    type(syntax_rule_t), intent(in), target :: rule

    end if
  else
    call lexer_put_back (lexer, lexeme)
    ok = .false.
  end if
end subroutine parse_args

```

The IGNORE syntax reads one lexeme and discards it if it is numeric, logical or string/identifier (but not a keyword). This is a successful match. Otherwise, the match fails. The node pointer is returned disassociated in any case.

(Parser: internal subroutines of parse_tree_init)+≡

```

subroutine parse_ignore (node, ok)
  type(parse_node_t), pointer :: node
  logical, intent(out) :: ok
  call lex (lexeme, lexer)
  select case (lexeme_get_type (lexeme))
    case (T_NUMERIC, T_IDENTIFIER, T_QUOTED)
      ok = .true.
    case default
      ok = .false.
  end select
  node => null ()
end subroutine parse_ignore

```

If the match fails and we cannot step back:

(Parser: internal subroutines of parse_tree_init)+≡

```

subroutine parse_error (rule, lexeme)
  type(syntax_rule_t), intent(in) :: rule
  type(lexeme_t), intent(in) :: lexeme
  character(80) :: buffer
  integer :: u, iostat
  call lexer_show_location (lexer)
  u = free_unit ()
  open (u, status = "scratch")
  write (u, "(A)", advance="no") "Expected syntax:"
  call syntax_rule_write (rule, u)
  write (u, "(A)", advance="no") "Found token:"

```

```

call lexeme_write (lexeme, u)
rewind (u)
do
  read (u, "(A)", iostat=iostat)  buffer
  if (iostat /= 0)  exit
  call msg_message (trim (buffer))
end do
call msg_fatal (" Syntax error " &
  // "(at or before the location indicated above)")
end subroutine parse_error

```

The finalizer recursively deallocates all nodes and their contents. For each node, `parse_node_final` is called on the sub-nodes, which in turn deallocates the token or sub-node array contained within each of them. At the end, only the top node remains to be deallocated.

```

(Parser: public)+≡
  public :: parse_tree_final

(Parser: procedures)+≡
  subroutine parse_tree_final (parse_tree)
    type(parse_tree_t), intent(inout) :: parse_tree
    if (associated (parse_tree%root_node)) then
      call parse_node_final (parse_tree%root_node)
      deallocate (parse_tree%root_node)
    end if
  end subroutine parse_tree_final

```

Print the parse tree. Print one token per line, indented according to the depth of the node.

The `verbose` version includes type identifiers for the nodes.

```

(Parser: public)+≡
  public :: parse_tree_write

(Parser: procedures)+≡
  subroutine parse_tree_write (parse_tree, unit, verbose)
    type(parse_tree_t), intent(in) :: parse_tree
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: verbose
    integer :: u
    logical :: short
    u = given_output_unit (unit); if (u < 0) return
    short = .true.; if (present (verbose)) short = .not. verbose
    write (u, "(A)") "Parse tree:"
    if (associated (parse_tree%root_node)) then
      call parse_node_write_rec (parse_tree%root_node, unit, short, 1)
    else
      write (u, *) "[empty]"
    end if
  end subroutine parse_tree_write

```

This is a generic error that can be issued if the parse tree does not meet the expectations of the parser. This most certainly indicates a bug.

```

(Parser: public)+≡
  public :: parse_tree_bug

```

```

(Parser: procedures)+≡
  subroutine parse_tree_bug (node, keys)
    type(parse_node_t), intent(in) :: node
    character(*), intent(in) :: keys
    call parse_node_write (node)
    call msg_bug (" Inconsistency in parse tree: expected " // keys)
  end subroutine parse_tree_bug

```

7.4.7 Access the parser

For scanning the parse tree we give access to the top node, as a node pointer. Of course, there should be no write access.

```

(Parser: public)+≡
  public :: parse_tree_get_root_ptr

(Parser: procedures)+≡
  function parse_tree_get_root_ptr (parse_tree) result (node)
    type(parse_node_t), pointer :: node
    type(parse_tree_t), intent(in), target :: parse_tree
    node => parse_tree%root_node
  end function parse_tree_get_root_ptr

```

7.4.8 Tools

This operation traverses the parse tree and simplifies any occurrences of a set of syntax rules. If such a parse node has only one sub-node, it is replaced by that subnode. (This makes sense only of the rules to eliminate have no meaningful token.)

```

(Parser: public)+≡
  public :: parse_tree_reduce

(Parser: procedures)+≡
  subroutine parse_tree_reduce (parse_tree, rule_key)
    type(parse_tree_t), intent(inout) :: parse_tree

7.5 XML Parser

The XML parser is actually independent from the previous modules of `lexer` and `parser`. However, for a generic I/O interface we make use of the `stream_t` facility.

We need the XML parser for reading and writing LHEF data files. Only a subset of XML is actually relevant. The parser is of the “pull” type, i.e., the program steers the reading of XML data in a context-sensitive manner.

```
<xml.f90>≡
  <File header>

  module xml

    <Use strings>
    use io_units
    use unit_tests
    use system_defs, only: BLANK, TAB
    use diagnostics
    use ifiles
    use lexers

    <Standard module head>

    <XML: public>

    <XML: types>

    contains

    <XML: procedures>

    <XML: tests>

  end module xml
```

7.5.1 Cached Stream

The stream type as defined in the `lexer` module is versatile regarding the choice of input channel, but it does not allow reading a section more than once. Here, we define an extension where we can return a string to the stream, which is stored in a cache variable, and presented to the caller for the next read.

```
<XML: public>≡
  public :: cstream_t

<XML: types>≡
  type, extends (stream_t) :: cstream_t
    logical :: cache_is_empty = .true.
    type(string_t) :: cache
    contains
    <XML: cstream: TBP>
  end type cstream_t
```

The initializers are simply inherited. We require a generic.

```

<XML: cstream: TBP>≡
  generic :: init => init_filename, init_unit, init_string, &
    init_ifile, init_line
  procedure :: init_filename => cstream_init_filename
  procedure :: init_unit => cstream_init_unit
  procedure :: init_string => cstream_init_string
  procedure :: init_ifile => cstream_init_ifile
  procedure :: init_line => cstream_init_line

<XML: procedures>≡
  subroutine cstream_init_filename (cstream, filename)
    class(cstream_t), intent(out) :: cstream
    character(*), intent(in) :: filename
    call stream_init (cstream%stream_t, filename)
  end subroutine cstream_init_filename

  subroutine cstream_init_unit (cstream, unit)
    class(cstream_t), intent(out) :: cstream
    integer, intent(in) :: unit
    call stream_init (cstream%stream_t, unit)
  end subroutine cstream_init_unit

  subroutine cstream_init_string (cstream, string)
    class(cstream_t), intent(out) :: cstream
    type(string_t), intent(in) :: string
    call stream_init (cstream%stream_t, string)
  end subroutine cstream_init_string

  subroutine cstream_init_ifile (cstream, ifile)
    class(cstream_t), intent(out) :: cstream
    type(ifile_t), intent(in) :: ifile
    call stream_init (cstream%stream_t, ifile)
  end subroutine cstream_init_ifile

  subroutine cstream_init_line (cstream, line)
    class(cstream_t), intent(out) :: cstream
    type(line_p), intent(in) :: line
    call stream_init (cstream%stream_t, line)
  end subroutine cstream_init_line

```

Finalizer: also inherited

```

<XML: cstream: TBP>+≡
  procedure :: final => cstream_final

<XML: procedures>+≡
  subroutine cstream_final (cstream)
    class(cstream_t), intent(inout) :: cstream
    cstream%cache_is_empty = .true.
    call stream_final (cstream%stream_t)
  end subroutine cstream_final

```

Get record: now, if there is a cache string, return this instead of the record from the stream.

```

<XML: cstream: TBP>+=
  procedure :: get_record => cstream_get_record

<XML: procedures>+=
  subroutine cstream_get_record (cstream, string, iostat)
    class(cstream_t), intent(inout) :: cstream
    type(string_t), intent(out) :: string
    integer, intent(out) :: iostat
    if (cstream%cache_is_empty) then
      call stream_get_record (cstream%stream_t, string, iostat)
    else
      string = cstream%cache
      cstream%cache_is_empty = .true.
      iostat = 0
    end if
  end subroutine cstream_get_record

```

Revert: return the (partially read) record to the stream, putting it in the cache.

```

<XML: cstream: TBP>+=
  procedure :: revert_record => cstream_revert_record

<XML: procedures>+=
  subroutine cstream_revert_record (cstream, string)
    class(cstream_t), intent(inout) :: cstream
    type(string_t), intent(in) :: string
    if (cstream%cache_is_empty) then
      cstream%cache = string
      cstream%cache_is_empty = .false.
    else
      call msg_bug ("CStream: attempt to revert twice")
    end if
  end subroutine cstream_revert_record

```

7.5.2 Attributes

A tag attribute has a name and a value; both are strings. When the attribute is defined, the `known` flag indicates this.

```

<XML: types>+=
  type :: attribute_t
    type(string_t) :: name
    type(string_t) :: value
    logical :: known = .false.
  contains
    <XML: attribute: TBP>
  end type attribute_t

```

Output in standard format, non-advancing. (If the value is unknown, we indicate this by a question mark, which is non-standard.)

```

<XML: attribute: TBP>=
  procedure :: write => attribute_write

```

```

<XML: procedures>+≡
  subroutine attribute_write (object, unit)
    class(attribute_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(A,'=')", advance = "no") char (object%name)

    end if
end function attribute_get_value

```

7.5.3 The Tag Type

The basic entity is the internal representation of an XML tag. The tag has a name, a well-defined set of attributes which may be mandatory or optional, and a flag that determines whether there is content or not. The content itself is not stored in the data structure.

```

<XML: public>+≡
    public :: xml_tag_t

<XML: types>+≡
    type :: xml_tag_t
        type(string_t) :: name
        type(attribute_t), dimension(:), allocatable :: attribute
        logical :: has_content = .false.
    contains
        <XML: tag: TBP>
    end type xml_tag_t

```

Initialization. There are different versions, depending on content.

```

<XML: tag: TBP>≡
    generic :: init => init_no_attributes
    procedure :: init_no_attributes => tag_init_no_attributes

<XML: procedures>+≡
    subroutine tag_init_no_attributes (tag, name, has_content)
        class(xml_tag_t), intent(out) :: tag
        type(string_t), intent(in) :: name
        logical, intent(in), optional :: has_content
        tag%name = name
        allocate (tag%attribute (0))
        if (present (has_content)) tag%has_content = has_content
    end subroutine tag_init_no_attributes

```

This version sets attributes.

```

<XML: tag: TBP>+≡
    generic :: init => init_with_attributes
    procedure :: init_with_attributes => tag_init_with_attributes

<XML: procedures>+≡
    subroutine tag_init_with_attributes (tag, name, attribute, has_content)
        class(xml_tag_t), intent(out) :: tag
        type(string_t), intent(in) :: name
        type(attribute_t), dimension(:), intent(in) :: attribute
        logical, intent(in), optional :: has_content
        tag%name = name
        allocate (tag%attribute (size (attribute)))
        tag%attribute = attribute
    end subroutine tag_init_with_attributes

```

```

        if (present (has_content)) tag%has_content = has_content
    end subroutine tag_init_with_attributes

```

Set an attribute value explicitly.

```

<XML: tag: TBP>+≡
    procedure :: set_attribute => tag_set_attribute

<XML: procedures>+≡
    subroutine tag_set_attribute (tag, i, value)
        class(xml_tag_t), intent(inout) :: tag
        integer, intent(in) :: i
        type(string_t), intent(in) :: value
        call tag%attribute(i)%set_value (value)
    end subroutine tag_set_attribute

```

Get an attribute value.

```

<XML: tag: TBP>+≡
    procedure :: get_attribute => tag_get_attribute

<XML: procedures>+≡
    function tag_get_attribute (tag, i) result (value)
        class(xml_tag_t), intent(in) :: tag
        integer, intent(in) :: i
        type(string_t) :: value
        value = tag%attribute(i)%get_value ()
    end function tag_get_attribute

```

Output to an I/O unit, default STDOUT. We use non-advancing output.

```

<XML: tag: TBP>+≡
    generic :: write => write_without_content
    procedure :: write_without_content => tag_write

<XML: procedures>+≡
    subroutine tag_write (tag, unit)
        class(xml_tag_t), intent(in) :: tag
        integer, intent(in), optional :: unit
        integer :: u, i
        u = given_output_unit (unit)
        write (u, "('<',A)", advance = "no") char (tag%name)
        do i = 1, size (tag%attribute)
            write (u, "(ix)", advance = "no")
            call tag%attribute(i)%write (u)
        end do
        if (tag%has_content) then
            write (u, "('>')", advance = "no")
        else
            write (u, "(' />')", advance = "no")
        end if
    end subroutine tag_write

```

If there is content, we should write the context next (arbitrary format), the write the corresponding closing tag. Again, non-advancing.

```

<XML: tag: TBP>+≡
    procedure :: close => tag_close

```

```

<XML: procedures>+≡
  subroutine tag_close (tag, unit)
    class(xml_tag_t), intent(in) :: tag
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "('</',A,'>')", advance = "no") char (tag%name)
  end subroutine tag_close

```

Given content as a single string, we can write tag, content, and closing at once

```

<XML: tag: TBP>+≡
  generic :: write => write_with_content
  procedure :: write_with_content => tag_write_with_content

<XML: procedures>+≡
  subroutine tag_write_with_content (tag, content, unit)
    class(xml_tag_t), intent(in) :: tag
    type(string_t), intent(in) :: content
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    call tag%write (u)
    write (u, "(A)", advance = "no") char (content)
    call tag%close (u)
  end subroutine tag_write_with_content

```

Input from stream. We know what we are looking for, so we check if the name matches, then fill attributes. We report an error if (a) an I/O error occurs, (b) we reach EOF before encountering the tag, (c) if the tag is incomplete.

Trailing text after reading a tag is put back to the input stream.

We assume that the tag is not broken across records, and that there is only one tag within the record. This is more restricted than standard XML.

```

<XML: tag: TBP>+≡
  procedure :: read => tag_read

<XML: procedures>+≡

```

Chapter 8

Random-Number Generator

These modules implement abstract types and tools for random-number generation.

rng_base Abstract random-number generator and factory

selectors Selection depending on weights and random numbers

8.1 Generic Random-Number Generator

For all generator implementations, we define a `rng` type which represents the state of a random-number generator with the associated methods that produce a random number. Furthermore, we define a `rng_factory` type. An object of this type is capable of allocating a sequence of `rng` objects. These generator states should be, if possible, statistically independent, so they can be used in parallel in different places of the event-generation chain.

```
<rng_base.f90>≡  
  <File header>  
  
  module rng_base  
  
    use kinds  
    use io_units  
    use format_utils, only: write_indent  
    use unit_tests  
  
    <Standard module head>  
  
    <RNG base: public>  
  
    <RNG base: types>  
  
    <RNG base: interfaces>  
  
    <RNG base: test types>  
  
    contains  
  
    <RNG base: tests>  
  
  end module rng_base
```

8.1.1 Generator type

The `rng` object is actually the state of the random-number generator. The methods `initialize/reset` and `call` the generator for this state.

```
<RNG base: public>≡  
  public :: rng_t  
  
<RNG base: types>≡  
  type, abstract :: rng_t  
    contains  
    <RNG base: rng: TBP>  
  end type rng_t
```

The `init` method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

The seed may be omitted. The behavior without seed is not defined, however.

```
<RNG base: rng: TBP>≡  
  procedure (rng_init), deferred :: init
```

```

<RNG base: interfaces>≡
  abstract interface
    subroutine rng_init (rng, seed)
      import
      class(rng_t), intent(out) :: rng
      integer, intent(in), optional :: seed
    end subroutine rng_init
  end interface

```

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

```

<RNG base: rng: TBP>+≡
  procedure (rng_final), deferred :: final

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_final (rng)
      import
      class(rng_t), intent(inout) :: rng
    end subroutine rng_final
  end interface

```

Output. We should, at least, identify the generator.

```

<RNG base: rng: TBP>+≡
  procedure (rng_write), deferred :: write

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_write (rng, unit, indent)
      import
      class(rng_t), intent(in) :: rng
      integer, intent(in), optional :: unit, indent
    end subroutine rng_write
  end interface

```

These routines generate a single and an array of default-precision random numbers, respectively.

```

<RNG base: rng: TBP>+≡
  generic :: generate => generate_single, generate_array
  procedure (rng_generate_single), deferred :: generate_single
  procedure (rng_generate_array), deferred :: generate_array

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_generate_single (rng, x)
      import
      class(rng_t), intent(inout) :: rng
      real(default), intent(out) :: x
    end subroutine rng_generate_single
  end interface

  abstract interface
    subroutine rng_generate_array (rng, x)

```

```

import
class(rng_t), intent(inout) :: rng
real(default), dimension(:), intent(out) :: x
end subroutine rng_generate_array
end interface

```

8.1.2 RNG Factory

A factory object has a `make` method that allocates and initializes a new generator of appropriate type. It uses a 16-bit integer for initialization. For a real-life implementation, the factory should return a sequence of statistically independent generators, and for different seeds, the sequences should also be independent.

```

⟨RNG base: public⟩+≡
  public :: rng_factory_t
⟨RNG base: types⟩+≡
  type, abstract :: rng_factory_t
  contains
  ⟨RNG base: rng factory: TBP⟩
end type rng_factory_t

```

Output. Should be short, just report the seed and current state of the factory.

```

⟨RNG base: rng factory: TBP⟩≡
  procedure (rng_factory_write), deferred :: write
⟨RNG base: interfaces⟩+≡
  abstract interface
    subroutine rng_factory_write (object, unit)
    import
    class(rng_factory_t), intent(in) :: object
    integer, intent(in), optional :: unit
    end subroutine rng_factory_write
  end interface

```

Initialize. It should be possible to do this repeatedly, resetting the state. The default seed should be 0.

```

⟨RNG base: rng factory: TBP⟩+≡
  procedure (rng_factory_init), deferred :: init
⟨RNG base: interfaces⟩+≡
  abstract interface
    subroutine rng_factory_init (factory, seed)
    import
    class(rng_factory_t), intent(out) :: factory
    integer(i16), intent(in), optional :: seed
    end subroutine rng_factory_init
  end interface

```

Spawn a new generator.

```

⟨RNG base: rng factory: TBP⟩+≡
  procedure (rng_factory_make), deferred :: make

```

```

<RNG base: interfaces>+≡
  abstract interface
    subroutine rng_factory_make (factory, rng)
      import
      class(rng_factory_t), intent(inout) :: factory
      class(rng_t), intent(out), allocatable :: rng
    end subroutine rng_factory_make
  end interface

```

8.1.3 Unit tests

```

<RNG base: public>+≡
  public :: rng_base_test

<RNG base: tests>≡
  subroutine rng_base_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <RNG base: execute tests>
  end subroutine rng_base_test

```

Test generator

The test 'mock' random generator generates a repeating series with the numbers 0.1, 0.3, 0.5, 0.7, 0.9. It has an integer stored as state. The integer must be one of 1, 3, 5, 7, 9.

```

<RNG base: public>+≡
  public :: rng_test_t

<RNG base: test types>≡
  type, extends (rng_t) :: rng_test_t
    integer :: state = 1
  contains
    procedure :: write => rng_test_write
    procedure :: init => rng_test_init
    procedure :: final => rng_test_final
    procedure :: generate_single => rng_test_generate_single
    procedure :: generate_array => rng_test_generate_array
  end type rng_test_t

```

Output. The state is a single number, so print it.

```

<RNG base: tests>+≡
  subroutine rng_test_write (rng, unit, indent)
    class(rng_test_t), intent(in) :: rng
    integer, intent(in), optional :: unit, indent
    integer :: u, ind
    u = given_output_unit (unit)
    ind = 0; if (present (indent)) ind = indent
    call write_indent (u, ind)
    write (u, "(A,IO,A)" "Random-number generator: &
      &test (state = ", rng%state, ")")

```

```
end subroutine rng_test_write
```

The default seed is 1.

```
<RNG base: tests>+≡
subroutine rng_test_init (rng, seed)
  class(rng_test_t), intent(out) :: rng
  integer, intent(in), optional :: seed
  if (present (seed)) rng%state = seed
end subroutine rng_test_init
```

Nothing to finalize:

```
<RNG base: tests>+≡
subroutine rng_test_final (rng)
  class(rng_test_t), intent(inout) :: rng
end subroutine rng_test_final
```

Generate a single number and advance the state.

```
<RNG base: tests>+≡
subroutine rng_test_generate_single (rng, x)
  class(rng_test_t), intent(inout) :: rng
  real(default), intent(out) :: x
  x = rng%state / 10._default
  rng%state = mod (rng%state + 2, 10)
end subroutine rng_test_generate_single
```

The array generator calls the single-item generator multiple times.

```
<RNG base: tests>+≡
subroutine rng_test_generate_array (rng, x)
  class(rng_test_t), intent(inout) :: rng
  real(default), dimension(:), intent(out) :: x
  integer :: i
  do i = 1, size (x)
    call rng%generate (x(i))
  end do
end subroutine rng_test_generate_array
```

Test Factory

This factory makes `rng_test_t` generators, initialized with integers 1, 3, 5, 7, 9 if given the input 0, 1, 2, 3, 4. The generators within one sequence are all identical, however.

```
<RNG base: public>+≡
public :: rng_test_factory_t

<RNG base: test types>+≡
type, extends (rng_factory_t) :: rng_test_factory_t
  integer :: seed = 1
contains
  <RNG base: rng test factory: TBP>
end type rng_test_factory_t
```

Output.

```
<RNG base: rng test factory: TBP>≡
  procedure :: write => rng_test_factory_write

<RNG base: tests>+≡
  subroutine rng_test_factory_write (object, unit)
    class(rng_test_factory_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A,I0,A)") "RNG factory: test (", object%seed, ")"
  end subroutine rng_test_factory_write
```

Initialize, translating the given seed.

```
<RNG base: rng test factory: TBP>+≡
  procedure :: init => rng_test_factory_init

<RNG base: tests>+≡
  subroutine rng_test_factory_init (factory, seed)
    class(rng_test_factory_t), intent(out) :: factory
    integer(i16), intent(in), optional :: seed
    if (present (seed)) factory%seed = mod (seed * 2 + 1, 10)
  end subroutine rng_test_factory_init
```

```
<RNG base: rng test factory: TBP>+≡
  procedure :: make => rng_test_factory_make

<RNG base: tests>+≡
  subroutine rng_test_factory_make (factory, rng)
    class(rng_test_factory_t), intent(inout) :: factory
    class(rng_t), intent(out), allocatable :: rng
    allocate (rng_test_t :: rng)
    select type (rng)
    type is (rng_test_t)
      call rng%init (int (factory%seed))
    end select
  end subroutine rng_test_factory_make
```

Generator check

Initialize the generator and draw random numbers.

```
<RNG base: execute tests>≡
  call test (rng_base_1, "rng_base_1", &
    "rng initialization and call", &
    u, results)

<RNG base: tests>+≡
  subroutine rng_base_1 (u)
    integer, intent(in) :: u
    class(rng_t), allocatable :: rng

    real(default) :: x
    real(default), dimension(2) :: x2
```

```

write (u, "(A)")  "* Test output: rng_base_1"

write (u, "(A)")  "* Test output end: rng_base_2"

end subroutine rng_base_2

```

8.2 Select from a weighted sample

```
<selectors.f90>≡  
  <File header>  
  
  module selectors  
  
    use kinds  
    use io_units  
    use unit_tests  
    use diagnostics  
    use rng_base  
  
    <Standard module head>  
  
    <Selectors: public>  
  
    <Selectors: types>  
  
    contains  
  
    <Selectors: procedures>  
  
    <Selectors: tests>  
  
  end module selectors
```

8.2.1 Selector type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

```
<Selectors: public>≡  
  public :: selector_t  
  
<Selectors: types>≡  
  type :: selector_t  
    integer, dimension(:), allocatable :: map  
    real(default), dimension(:), allocatable :: weight  
    real(default), dimension(:), allocatable :: acc  
    contains  
    <Selectors: selector: TBP>  
  end type selector_t
```

Display contents.

```
<Selectors: selector: TBP>≡  
  procedure :: write => selector_write  
  
<Selectors: procedures>≡  
  subroutine selector_write (object, unit)  
    class(selector_t), intent(in) :: object  
    integer, intent(in), optional :: unit  
    integer :: u, i  
    u = given_output_unit (unit)  
    write (u, "(1x,A)") "Selector: i, weight, acc. weight"
```

```

    if (allocated (object%weight)) then
      do i = 1, size (object%weight)
        write (u, "(3x,I0,1x,ES19.12,1x,ES19.12)") &
          object%map(i), object%weight(i), object%acc(i)
      end do
    else
      write (u, "(3x,A)") "[undefined]"
    end if
  end subroutine selector_write

```

We pack the input weight array such that zero-weight entries are removed. We also normalize it. This makes a map array for mapping the selected weight to the actual entry necessary.

```

<Selectors: selector: TBP>+≡
  procedure :: init => selector_init

<Selectors: procedures>+≡
  subroutine selector_init (selector, weight)
    class(selector_t), intent(out) :: selector
    real(default), dimension(:), intent(in) :: weight
    real(default) :: s

<Selectors: tests>≡
  subroutine selectors_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <Selectors: execute tests>
  end subroutine selectors_test

```

Basic check

Initialize the selector and draw random numbers.

```

<Selectors: execute tests>≡
  call test (selectors_1, "selectors_1", &
    "rng initialization and call", &
    u, results)

<Selectors: tests>+≡
  subroutine selectors_1 (u)
    integer, intent(in) :: u
    type(selector_t) :: selector
    class(rng_t), allocatable, target :: rng
    integer :: i, n

    write (u, "(A)")  "* Test output: selectors_1"
    write (u, "(A)")  "* Purpose: initialize a selector and test it"
    write (u, "(A)")

    write (u, "(A)")  "* Initialize selector"
    write (u, "(A)")

    call selector%init &
      ([2._default, 3.5_default, 0._default, &
        2._default, 0.5_default, 2._default])
    call selector%write (u)

    write (u, "(A)")
    write (u, "(A)")  "* Select numbers using predictable test generator"
    write (u, "(A)")

    allocate (rng_test_t :: rng)
    call rng%init (1)

    do i = 1, 5
      call selector%generate (rng, n)
      write (u, "(1x,I0)")  n
    end do

    write (u, "(A)")
    write (u, "(A)")  "* Select numbers using real input number"
    write (u, "(A)")

    write (u, "(1x,A,I0)")  "select(0.00) = ", selector%select (0._default)
    write (u, "(1x,A,I0)")  "select(0.77) = ", selector%select (0.77_default)
    write (u, "(1x,A,I0)")  "select(1.00) = ", selector%select (1._default)

```

```

write (u, "(A)")
write (u, "(A)")  "* Get weight"
write (u, "(A)")

write (u, "(1x,A,ES19.12)")  "weight(2) =", selector%get_weight(2)
write (u, "(1x,A,ES19.12)")  "weight(3) =", selector%get_weight(3)

write (u, "(A)")
write (u, "(A)")  "* Cleanup"

call rng%final ()

write (u, "(A)")
write (u, "(A)")  "* Test output end: selectors_1"

end subroutine selectors_1

```

Chapter 9

Physics

Here we collect definitions and functions that we need for (particle) physics in general, to make them available for the more specific needs of WHIZARD.

physics_defs Physical constants.

c_particles A simple data type for particles which is C compatible.

lorentz Define three-vectors, four-vectors and Lorentz transformations and common operations for them.

sm_physics Here, running functions are stored for special kinematical setup like running coupling constants, Catani-Seymour dipoles, or Sudakov factors.

sm_qcd Definitions and methods for dealing with the running QCD coupling.

9.1 Physics Constants

There is also the generic `constants` module. The constants listed here are more specific for particle physics.

```
<physics_defs.f90>≡  
  <File header>  
  
  module physics_defs  
  
    <Use kinds>  
    use constants, only: one, two, three  
  
    <Standard module head>  
  
    <Physics defs: public parameters>  
  
  end module physics_defs
```

9.1.1 Units

Conversion from energy units to cross-section units.

```
<Physics defs: public parameters>≡  
  real(default), parameter, public :: &  
    conv = 0.38937966e12_default
```

Rescaling factor.

```
<Physics defs: public parameters>+≡  
  real(default), parameter, public :: &  
    pb_per_fb = 1.e-3_default
```

String for the default energy and cross-section units.

```
<Physics defs: public parameters>+≡  
  character(*), parameter, public :: &  
    energy_unit = "GeV"  
  character(*), parameter, public :: &  
    cross_section_unit = "fb"
```

9.1.2 SM and QCD constants

```
<Physics defs: public parameters>+≡  
  real(default), parameter, public :: &  
    NC = three, &  
    CF = (NC**2 - one)/two/NC, &  
    CA = NC, &  
    TR = one/two
```

9.1.3 Parameter Reference values

These are used exclusively in the context of running QCD parameters. In other contexts, we rely on the uniform parameter set as provided by the model definition, modifiable by the user.

```
<Physics defs: public parameters>+≡
```

```

real(default), public, parameter :: MZ_REF = 91.188_default
real(default), public, parameter :: ALPHA_QCD_MZ_REF = 0.1178_default
real(default), public, parameter :: LAMBDA_QCD_REF = 200.e-3_default

```

9.1.4 Particle codes

Let us define a few particle codes independent of the model.

We need an UNDEFINED value:

```

<Physics defs: public parameters>+=
integer, parameter, public :: UNDEFINED = 0

```

SM fermions:

```

<Physics defs: public parameters>+=
integer, parameter, public :: ELECTRON = 11

```

Gauge bosons:

```

<Physics defs: public parameters>+=
integer, parameter, public :: GLUON = 21
integer, parameter, public :: PHOTON = 22
integer, parameter, public :: Z_BOSON = 23
integer, parameter, public :: W_BOSON = 24

```

Hadrons:

```

<Physics defs: public parameters>+=
integer, parameter, public :: PROTON = 2212

<Physics defs: public parameters>+=
integer, parameter, public :: PION = 111
integer, parameter, public :: PIPLUS = 211
integer, parameter, public :: PIMINUS = - PIPLUS

```

Hadron remnants (internal)

```

<Physics defs: public parameters>+=
integer, parameter, public :: HADRON_REMNANT = 90
integer, parameter, public :: HADRON_REMNANT_SINGLET = 91
integer, parameter, public :: HADRON_REMNANT_TRIPLET = 92
integer, parameter, public :: HADRON_REMNANT_OCTET = 93

```

Generic particles for internal use in event analysis:

```

<Physics defs: public parameters>+=
integer, parameter, public :: PRT_ANY = 81
integer, parameter, public :: PRT_VISIBLE = 82
integer, parameter, public :: PRT_CHARGED = 83
integer, parameter, public :: PRT_COLORED = 84

```

Further particle codes for internal use:

```

<Physics defs: public parameters>+=
integer, parameter, public :: INVALID = 97
integer, parameter, public :: KEYSTONE = 98
integer, parameter, public :: COMPOSITE = 99

```

9.1.5 Spin codes

Somewhat redundant, but for better readability we define named constants for spin types. If the mass is nonzero, this is equal to the number of degrees of freedom.

```
(Physics defs: public parameters)+≡  
integer, parameter, public:: UNKNOWN=0  
integer, parameter, public :: SCALAR=1, SPINOR=2, VECTOR=3, &  
VECTORSPINOR=4, TENSOR=5
```

Isospin types and charge types are counted in an analogous way, where charge type 1 is charge 0, 2 is charge 1/3, and so on. Zero always means unknown. Note that charge and isospin types have an explicit sign.

Color types are defined as the dimension of the representation.

9.2 C-compatible Particle Type

For easy communication with C code, we introduce a simple C-compatible type for particles. The components are either default C integers or default C doubles.

The `c_prt` type is transparent, and its contents should be regarded as part of the interface.

```

<c_particles.f90>≡
  <File header>

  module c_particles

    use, intrinsic :: iso_c_binding !NODEP!

    use io_units
    use format_defs, only: FMT_14, FMT_19

    <Standard module head>

    <C Particles: public>

    <C Particles: types>

    contains

    <C Particles: procedures>
    end module c_particles

  <C Particles: public>≡
    public :: c_prt_t

  <C Particles: types>≡
    type, bind(C) :: c_prt_t
      integer(c_int) :: type = 0
      integer(c_int) :: pdg = 0
      integer(c_int) :: polarized = 0
      integer(c_int) :: h = 0
      real(c_double) :: pe = 0
      real(c_double) :: px = 0
      real(c_double) :: py = 0
      real(c_double) :: pz = 0
      real(c_double) :: p2 = 0
    end type c_prt_t

```

This is for debugging only, there is no C binding. It is a simplified version of `prt_write`.

```

  <C Particles: public>+≡
    public :: c_prt_write

  <C Particles: procedures>≡
    subroutine c_prt_write (prt, unit)
      type(c_prt_t), intent(in) :: prt
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit); if (u < 0) return

```

```

write (u, "(1x,A)", advance="no")  prt("
write (u, "(I0,':')", advance="no")  prt%type
if (prt%polarized /= 0) then
    write (u, "(I0,'/',I0,'|')", advance="no")  prt%pdg, prt%h
else
    write (u, "(I0,'|')", advance="no")  prt%pdg
end if
write (u, "(" // FMT_14 // ",','," // FMT_14 // ",','," // &
      FMT_14 // ",','," // FMT_14 // ")", advance="no") &
      prt%pe, prt%px, prt%py, prt%pz
write (u, "( '|'," // FMT_19 // ")", advance="no")  prt%p2
write (u, "(A)"  " )"
end subroutine c_prt_write

```

9.3 Lorentz algebra

Define Lorentz vectors, three-vectors, boosts, and some functions to manipulate them.

To make maximum use of this, all functions, if possible, are declared elemental (or pure, if this is not possible).

```
<lorentz.f90>≡  
  <File header>  
  
  module lorentz  
  
    <Use kinds>  
    use io_units  
    use constants, only: pi, twopi, degree  
    use format_defs, only: FMT_15, FMT_17, FMT_19  
    use format_utils, only: pac_fmt  
    use diagnostics  
    use c_particles  
  
    <Standard module head>  
  
    <Lorentz: public>  
  
    <Lorentz: public operators>  
  
    <Lorentz: public functions>  
  
    <Lorentz: types>  
  
    <Lorentz: parameters>  
  
    <Lorentz: interfaces>  
  
    contains  
  
    <Lorentz: procedures>  
  end module lorentz
```

9.3.1 Three-vectors

First of all, let us introduce three-vectors in a trivial way. The functions and overloaded elementary operations clearly are too much overhead, but we like to keep the interface for three-vectors and four-vectors exactly parallel. By the way, we might attach a label to a vector by extending the type definition later.

```
<Lorentz: public>≡  
  public :: vector3_t  
  
<Lorentz: types>≡  
  type :: vector3_t  
    private  
    real(default), dimension(3) :: p  
  end type vector3_t
```

Output a vector

```

(Lorentz: public)+≡
    public :: vector3_write

(Lorentz: procedures)≡
    subroutine vector3_write (p, unit, testflag)
        type(vector3_t), intent(in) :: p
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: testflag
        character(len=7) :: fmt
        integer :: u
        u = given_output_unit (unit); if (u < 0) return
        call pac_fmt (fmt, FMT_19, FMT_15, testflag)
        write(u, "(1x,A,3(1x," // fmt // "))" ) 'P = ', p%p
    end subroutine vector3_write

```

This is a three-vector with zero components

```

(Lorentz: public)+≡
    public :: vector3_null

(Lorentz: parameters)≡
    type(vector3_t), parameter :: vector3_null = &
        vector3_t ([ 0._default, 0._default, 0._default ])

```

Canonical three-vector:

```

(Lorentz: public)+≡
    public :: vector3_canonical

(Lorentz: procedures)+≡
    elemental function vector3_canonical (k) result (p)
        type(vector3_t) :: p
        integer, intent(in) :: k
        p = vector3_null
        p%p(k) = 1
    end function vector3_canonical

```

A moving particle (k -axis, or arbitrary axis). Note that the function for the generic momentum cannot be elemental.

```

(Lorentz: public)+≡
    public :: vector3_moving

(Lorentz: interfaces)≡
    interface vector3_moving
        module procedure vector3_moving_canonical
        module procedure vector3_moving_generic
    end interface

(Lorentz: procedures)+≡
    elemental function vector3_moving_canonical (p, k) result(q)
        type(vector3_t) :: q
        real(default), intent(in) :: p
        integer, intent(in) :: k
        q = vector3_null
        q%p(k) = p

```

```

end function vector3_moving_canonical
pure function vector3_moving_generic (p) result(q)
  real(default), dimension(3), intent(in) :: p
  type(vector3_t) :: q
  q%p = p
end function vector3_moving_generic

```

Equality and inequality

```

<Lorentz: public operators>≡
  public :: operator(==), operator(/=)

<Lorentz: interfaces>+≡
  interface operator(==)
    module procedure vector3_eq
  end interface
  interface operator(/=)
    module procedure vector3_neq
  end interface

<Lorentz: procedures>+≡
  elemental function vector3_eq (p, q) result (r)
    logical :: r
    type(vector3_t), intent(in) :: p,q
    r = all (p%p == q%p)
  end function vector3_eq
  elemental function vector3_neq (p, q) result (r)
    logical :: r
    type(vector3_t), intent(in) :: p,q
    r = any (p%p /= q%p)
  end function vector3_neq

```

Define addition and subtraction

```

<Lorentz: public operators>+≡
  public :: operator(+), operator(-)

<Lorentz: interfaces>+≡
  interface operator(+)
    module procedure add_vector3
  end interface
  interface operator(-)
    module procedure sub_vector3
  end interface

<Lorentz: procedures>+≡
  elemental function add_vector3 (p, q) result (r)
    type(vector3_t) :: r
    type(vector3_t), intent(in) :: p,q
    r%p = p%p + q%p
  end function add_vector3
  elemental function sub_vector3 (p, q) result (r)
    type(vector3_t) :: r
    type(vector3_t), intent(in) :: p,q
    r%p = p%p - q%p
  end function sub_vector3

```

The multiplication sign is overloaded with scalar multiplication; similarly division:

```

(Lorentz: public operators)+≡
    public :: operator(*), operator(/)

(Lorentz: interfaces)+≡
    interface operator(*)
        module procedure prod_integer_vector3, prod_vector3_integer
        module procedure prod_real_vector3, prod_vector3_real
    end interface
    interface operator(/)
        module procedure div_vector3_real, div_vector3_integer
    end interface

(Lorentz: procedures)+≡
    elemental function prod_real_vector3 (s, p) result (q)
        type(vector3_t) :: q
        real(default), intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = s * p%p
    end function prod_real_vector3
    elemental function prod_vector3_real (p, s) result (q)
        type(vector3_t) :: q
        real(default), intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = s * p%p
    end function prod_vector3_real
    elemental function div_vector3_real (p, s) result (q)
        type(vector3_t) :: q
        real(default), intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = p%p/s
    end function div_vector3_real
    elemental function prod_integer_vector3 (s, p) result (q)
        type(vector3_t) :: q
        integer, intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = s * p%p
    end function prod_integer_vector3
    elemental function prod_vector3_integer (p, s) result (q)
        type(vector3_t) :: q
        integer, intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = s * p%p
    end function prod_vector3_integer
    elemental function div_vector3_integer (p, s) result (q)
        type(vector3_t) :: q
        integer, intent(in) :: s
        type(vector3_t), intent(in) :: p
        q%p = p%p/s
    end function div_vector3_integer

```

The multiplication sign can also indicate scalar products:

```

(Lorentz: interfaces)+≡

```

```

interface operator(*)
  module procedure prod_vector3
end interface

<Lorentz: procedures>+≡
  elemental function prod_vector3 (p, q) result (s)
    real(default) :: s
    type(vector3_t), intent(in) :: p,q
    s = dot_product (p%p, q%p)
  end function prod_vector3

<Lorentz: public functions>≡
  public :: cross_product

<Lorentz: interfaces>+≡
  interface cross_product
    module procedure vector3_cross_product
  end interface

<Lorentz: procedures>+≡
  elemental function vector3_cross_product (p, q) result (r)
    type(vector3_t) :: r
    type(vector3_t), intent(in) :: p,q
    integer :: i
    do i=1,3
      r%p(i) = dot_product (p%p, matmul(epsilon_three(i,:,:), q%p))
    end do
  end function vector3_cross_product

```

Exponentiation is defined only for integer powers. Odd powers mean take the square root; so `p**1` is the length of `p`.

```

<Lorentz: public operators>+≡
  public :: operator(**)

<Lorentz: interfaces>+≡
  interface operator(**)
    module procedure power_vector3
  end interface

<Lorentz: procedures>+≡
  elemental function power_vector3 (p, e) result (s)
    real(default) :: s
    type(vector3_t), intent(in) :: p
    integer, intent(in) :: e
    s = dot_product (p%p, p%p)
    if (e/=2) then
      if (mod(e,2)==0) then
        s = s**(e/2)
      else
        s = sqrt(s)**e
      end if
    end if
  end function power_vector3

```

Finally, we need a negation.

```

<Lorentz: interfaces>+≡
    interface operator(-)
        module procedure negate_vector3
    end interface

<Lorentz: procedures>+≡
    elemental function negate_vector3 (p) result (q)
        type(vector3_t) :: q
        type(vector3_t), intent(in) :: p
        integer :: i
        do i = 1, 3
            if (p%p(i) == -p%p(i)) then
                q%p(i) = 0
            else
                q%p(i) = -p%p(i)
            end if
        end do
    end function negate_vector3

```

The sum function can be useful:

```

<Lorentz: public functions>+≡
    public :: sum

<Lorentz: interfaces>+≡
    interface sum
        module procedure sum_vector3
    end interface

<Lorentz: public>+≡
    public :: vector3_set_component

<Lorentz: procedures>+≡
    subroutine vector3_set_component (p, i, value)
        type(vector3_t), intent(inout) :: p
        integer, intent(in) :: i
        real(default), intent(in) :: value
        p%p(i) = value
    end subroutine vector3_set_component

<Lorentz: procedures>+≡
    pure function sum_vector3 (p) result (q)
        type(vector3_t) :: q
        type(vector3_t), dimension(:), intent(in) :: p
        integer :: i
        do i=1, 3
            q%p(i) = sum (p%p(i))
        end do
    end function sum_vector3

```

Any component:

```

<Lorentz: public>+≡
    public :: vector3_get_component

```

```

⟨Lorentz: procedures⟩+≡
  elemental function vector3_get_component (p, k) result (c)
    type(vector3_t), intent(in) :: p
    integer, intent(in) :: k
    real(default) :: c
    c = p%p(k)
  end function vector3_get_component

```

Extract all components. This is not elemental.

```

⟨Lorentz: public⟩+≡
  public :: vector3_get_components

⟨Lorentz: procedures⟩+≡
  pure function vector3_get_components (p) result (a)
    type(vector3_t), intent(in) :: p
    real(default), dimension(3) :: a
    a = p%p
  end function vector3_get_components

```

This function returns the direction of a three-vector, i.e., a normalized three-vector. If the vector is null, we return a null vector.

```

⟨Lorentz: public functions⟩+≡
  public :: direction

⟨Lorentz: interfaces⟩+≡
  interface direction
    module procedure vector3_get_direction
  end interface

⟨Lorentz: procedures⟩+≡
  elemental function vector3_get_direction (p) result (q)
    type(vector3_t) :: q
    type(vector3_t), intent(in) :: p
    real(default) :: pp
    pp = p**1
    if (pp /= 0) then
      q%p = p%p / pp
    else
      q%p = 0
    end if
  end function vector3_get_direction

```

9.3.2 Four-vectors

In four-vectors the zero-component needs special treatment, therefore we do not use the standard operations. Sure, we pay for the extra layer of abstraction by losing efficiency; so we have to assume that the time-critical applications do not involve four-vector operations.

```

⟨Lorentz: public⟩+≡
  public :: vector4_t

```

```

<Lorentz: types>+≡
  type :: vector4_t
  private
    real(default), dimension(0:3) :: p = &
      [0._default, 0._default, 0._default, 0._default]
  end type vector4_t

```

Output a vector

```

<Lorentz: public>+≡
  public :: vector4_write

<Lorentz: procedures>+≡
  subroutine vector4_write (p, unit, show_mass, testflag)
    type(vector4_t), intent(in) :: p
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: show_mass
    logical, intent(in), optional :: testflag
    integer :: u
    character(len=7) :: fmt
    call pac_fmt (fmt, FMT_19, FMT_15, testflag)
    u = given_output_unit (unit); if (u < 0) return
    write(u, "(1x,A,1x," // fmt // ")") 'E = ', p%p(0)
    write(u, "(1x,A,3(1x," // fmt // "))") 'P = ', p%p(1:)
    if (present (show_mass)) then
      if (show_mass) &
        write (u, "(1x,A,1x," // fmt // ")") 'M = ', p**1
    end if
  end subroutine vector4_write

```

Binary I/O

```

<Lorentz: public>+≡
  public :: vector4_write_raw
  public :: vector4_read_raw

<Lorentz: procedures>+≡
  subroutine vector4_write_raw (p, u)
    type(vector4_t), intent(in) :: p
    integer, intent(in) :: u
    write (u) p%p
  end subroutine vector4_write_raw

  subroutine vector4_read_raw (p, u, iostat)
    type(vector4_t), intent(out) :: p
    integer, intent(in) :: u
    integer, intent(out), optional :: iostat
    read (u, iostat=iostat) p%p
  end subroutine vector4_read_raw

```

This is a four-vector with zero components

```

<Lorentz: public>+≡
  public :: vector4_null

<Lorentz: parameters>+≡
  type(vector4_t), parameter :: vector4_null = &
    vector4_t ([ 0._default, 0._default, 0._default, 0._default ])

```

Canonical four-vector:

```

(Lorentz: public)+≡
    public :: vector4_canonical

(Lorentz: procedures)+≡
    elemental function vector4_canonical (k) result (p)
        type(vector4_t) :: p
        integer, intent(in) :: k
        p = vector4_null
        p%k = 1
    end function vector4_canonical

```

A particle at rest:

```

(Lorentz: public)+≡
    public :: vector4_at_rest

(Lorentz: procedures)+≡
    elemental function vector4_at_rest (m) result (p)
        type(vector4_t) :: p
        real(default), intent(in) :: m
        p = vector4_t ([ m, 0._default, 0._default, 0._default ])
    end function vector4_at_rest

```

A moving particle (k -axis, or arbitrary axis)

```

(Lorentz: public)+≡
    public :: vector4_moving

(Lorentz: interfaces)+≡
    interface vector4_moving
        module procedure vector4_moving_canonical
        module procedure vector4_moving_generic
    end interface

(Lorentz: procedures)+≡
    elemental function vector4_moving_canonical (E, p, k) result (q)
        type(vector4_t) :: q
        real(default), intent(in) :: E, p
        integer, intent(in) :: k
        q = vector4_at_rest(E)
        q%p(k) = p
    end function vector4_moving_canonical
    elemental function vector4_moving_generic (E, p) result (q)
        type(vector4_t) :: q
        real(default), intent(in) :: E
        type(vector3_t), intent(in) :: p
        q%p(0) = E
        q%p(1:) = p%p
    end function vector4_moving_generic

```

Equality and inequality

```

(Lorentz: interfaces)+≡
    interface operator(==)
        module procedure vector4_eq
    end interface

```

```

interface operator(/=)
  module procedure vector4_neq
end interface

<Lorentz: procedures>+≡
elemental function vector4_eq (p, q) result (r)
  logical :: r
  type(vector4_t), intent(in) :: p,q
  r = all (p%p == q%p)
end function vector4_eq
elemental function vector4_neq (p, q) result (r)
  logical :: r
  type(vector4_t), intent(in) :: p,q
  r = any (p%p /= q%p)
end function vector4_neq

```

Addition and subtraction:

```

<Lorentz: interfaces>+≡
interface operator(+)
  module procedure add_vector4
end interface
interface operator(-)
  module procedure sub_vector4
end interface

<Lorentz: procedures>+≡
elemental function add_vector4 (p,q) result (r)
  type(vector4_t) :: r
  type(vector4_t), intent(in) :: p,q
  r%p = p%p + q%p
end function add_vector4
elemental function sub_vector4 (p,q) result (r)
  type(vector4_t) :: r
  type(vector4_t), intent(in) :: p,q
  r%p = p%p - q%p
end function sub_vector4

```

We also need scalar multiplication and division:

```

<Lorentz: interfaces>+≡
interface operator(*)
  module procedure prod_real_vector4, prod_vector4_real
  module procedure prod_integer_vector4, prod_vector4_integer
end interface
interface operator(/)
  module procedure div_vector4_real
  module procedure div_vector4_integer
end interface

<Lorentz: procedures>+≡
elemental function prod_real_vector4 (s, p) result (q)
  type(vector4_t) :: q
  real(default), intent(in) :: s
  type(vector4_t), intent(in) :: p
  q%p = s * p%p

```

```

end function prod_real_vector4
elemental function prod_vector4_real (p, s) result (q)
  type(vector4_t) :: q
  real(default), intent(in) :: s
  type(vector4_t), intent(in) :: p
  q%p = s * p%p
end function prod_vector4_real
elemental function div_vector4_real (p, s) result (q)
  type(vector4_t) :: q
  real(default), intent(in) :: s
  type(vector4_t), intent(in) :: p
  q%p = p%p/s
end function div_vector4_real
elemental function prod_integer_vector4 (s, p) result (q)
  type(vector4_t) :: q
  integer, intent(in) :: s
  type(vector4_t), intent(in) :: p
  q%p = s * p%p
end function prod_integer_vector4
elemental function prod_vector4_integer (p, s) result (q)
  type(vector4_t) :: q
  integer, intent(in) :: s
  type(vector4_t), intent(in) :: p
  q%p = s * p%p
end function prod_vector4_integer
elemental function div_vector4_integer (p, s) result (q)
  type(vector4_t) :: q
  integer, intent(in) :: s
  type(vector4_t), intent(in) :: p
  q%p = p%p/s
end function div_vector4_integer

```

Scalar products and squares in the Minkowski sense:

```

<Lorentz: interfaces>+≡
  interface operator(*)
    module procedure prod_vector4
  end interface
  interface operator(**)
    module procedure power_vector4
  end interface

<Lorentz: procedures>+≡
  elemental function prod_vector4 (p, q) result (s)
    real(default) :: s
    type(vector4_t), intent(in) :: p,q
    s = p%p(0)*q%p(0) - dot_product(p%p(1:), q%p(1:))
  end function prod_vector4

```

The power operation for four-vectors is signed, i.e., p^{**1} is positive for timelike and negative for spacelike vectors. Note that $(p^{**1})^{**2}$ is not necessarily equal to p^{**2} .

```

<Lorentz: procedures>+≡
  elemental function power_vector4 (p, e) result (s)

```

```

real(default) :: s
type(vector4_t), intent(in) :: p
integer, intent(in) :: e
s = p*p
if (e/=2) then
  if (mod(e,2)==0) then
    s = s**(e/2)
  elseif (s>=0) then
    s = sqrt(s)**e
  else
    s = -(sqrt(abs(s))**e)
  end if
end if
end function power_vector4

```

Finally, we introduce a negation

```

<Lorentz: interfaces>+≡
interface operator(-)
  module procedure negate_vector4
end interface

<Lorentz: procedures>+≡
elemental function negate_vector4 (p) result (q)
  type(vector4_t) :: q
  type(vector4_t), intent(in) :: p
  integer :: i
  do i = 0, 3
    if (p%p(i) == -p%p(i)) then
      q%p(i) = 0
    else
      q%p(i) = -p%p(i)
    end if
  end do
end function negate_vector4

```

The sum function can be useful:

```

<Lorentz: interfaces>+≡
interface sum
  module procedure sum_vector4
end interface

<Lorentz: procedures>+≡
pure function sum_vector4 (p) result (q)
  type(vector4_t) :: q
  type(vector4_t), dimension(:), intent(in) :: p
  integer :: i
  do i=0, 3
    q%p(i) = sum (p%p(i))
  end do
end function sum_vector4

```

9.3.3 Conversions

Manually set a component of the four-vector:

```
<Lorentz: public>+≡
    public :: vector4_set_component

<Lorentz: procedures>+≡
    subroutine vector4_set_component (p, k, c)
        type(vector4_t), intent(inout) :: p
        integer, intent(in) :: k
        real(default), intent(in) :: c
        p%p(k) = c
    end subroutine vector4_set_component
```

Any component:

```
<Lorentz: public>+≡
    public :: vector4_get_component

<Lorentz: procedures>+≡
    elemental function vector4_get_component (p, k) result (c)
        real(default) :: c
        type(vector4_t), intent(in) :: p
        integer, intent(in) :: k
        c = p%p(k)
    end function vector4_get_component
```

Extract all components. This is not elemental.

```
<Lorentz: public>+≡
    public :: vector4_get_components

<Lorentz: procedures>+≡
    pure function vector4_get_components (p) result (a)
        real(default), dimension(0:3) :: a
        type(vector4_t), intent(in) :: p
        a = p%p
    end function vector4_get_components
```

This function returns the space part of a four-vector, such that we can apply three-vector operations on it:

```
<Lorentz: public functions>+≡
    public :: space_part

<Lorentz: interfaces>+≡
    interface space_part
        module procedure vector4_get_space_part
    end interface

<Lorentz: procedures>+≡
    elemental function vector4_get_space_part (p) result (q)
        type(vector3_t) :: q
        type(vector4_t), intent(in) :: p
        q%p = p%p(1:)
    end function vector4_get_space_part
```

This function returns the direction of a four-vector, i.e., a normalized three-vector. If the four-vector has zero space part, we return a null vector.

```

(Lorentz: interfaces)+≡
    interface direction
        module procedure vector4_get_direction
    end interface

(Lorentz: procedures)+≡
    elemental function vector4_get_direction (p) result (q)
        type(vector3_t) :: q
        type(vector4_t), intent(in) :: p
        real(default) :: qq
        q%p = p%p(1:)
        qq = q**1
        if (qq /= 0) then
            q%p = q%p / qq
        else
            q%p = 0
        end if
    end function vector4_get_direction

```

This function returns the four-vector as an ordinary array. A second version for an array of four-vectors.

```

(Lorentz: public functions)+≡
    public :: array_from_vector4

(Lorentz: interfaces)+≡
    interface array_from_vector4
        module procedure array_from_vector4_1
        module procedure array_from_vector4_2
    end interface

(Lorentz: procedures)+≡
    pure function array_from_vector4_1 (p) result (a)
        type(vector4_t), intent(in) :: p
        real(default), dimension(0:3) :: a
        a = p%p
    end function array_from_vector4_1

    pure function array_from_vector4_2 (p) result (a)
        type(vector4_t), dimension(:), intent(in) :: p
        real(default), dimension(0:3, size(p)) :: a
        integer :: i
        forall (i=1:size(p))
            a(0:3,i) = p(i)%p
        end forall
    end function array_from_vector4_2

```

Transform the momentum of a `c_prt` object into a four-vector:

```

(Lorentz: public)+≡
    public :: vector4_from_c_prt

(Lorentz: procedures)+≡
    elemental function vector4_from_c_prt (c_prt) result (p)

```

```

type(vector4_t) :: p
type(c_prt_t), intent(in) :: c_prt
p%p(0) = c_prt%pe
p%p(1) = c_prt%px
p%p(2) = c_prt%py
p%p(3) = c_prt%pz
end function vector4_from_c_prt

```

Initialize a `c_prt_t` object with the components of a four-vector as its kinematical entries. Compute the invariant mass, or use the optional mass-squared value instead.

```

<Lorentz: public>+≡
public :: vector4_to_c_prt

<Lorentz: procedures>+≡
elemental function vector4_to_c_prt (p, p2) result (c_prt)
type(c_prt_t) :: c_prt
type(vector4_t), intent(in) :: p
real(default), intent(in), optional :: p2
c_prt%pe = p%p(0)
c_prt%px = p%p(1)
c_prt%py = p%p(2)
c_prt%pz = p%p(3)
if (present (p2)) then
c_prt%p2 = p2
else
c_prt%p2 = p ** 2
end if
end function vector4_to_c_prt

```

9.3.4 Angles

Return the angles in a canonical system. The angle ϕ is defined between $0 \leq \phi < 2\pi$. In degenerate cases, return zero.

```

<Lorentz: public functions>+≡
public :: azimuthal_angle

<Lorentz: interfaces>+≡
interface azimuthal_angle
module procedure vector3_azimuthal_angle
module procedure vector4_azimuthal_angle
end interface

<Lorentz: procedures>+≡
elemental function vector3_azimuthal_angle (p) result (phi)
real(default) :: phi
type(vector3_t), intent(in) :: p
if (any(p%p(1:2)/=0)) then
phi = atan2(p%p(2), p%p(1))
if (phi < 0) phi = phi + twopi
else
phi = 0
end if

```

```

end function vector3_azimuthal_angle
elemental function vector4_azimuthal_angle (p) result (phi)
  real(default) :: phi
  type(vector4_t), intent(in) :: p
  phi = vector3_azimuthal_angle (space_part (p))
end function vector4_azimuthal_angle

```

Azimuthal angle in degrees

```

<Lorentz: public functions>+≡
  public :: azimuthal_angle_deg

<Lorentz: interfaces>+≡
  interface azimuthal_angle_deg
    module procedure vector3_azimuthal_angle_deg
    module procedure vector4_azimuthal_angle_deg
  end interface

<Lorentz: procedures>+≡
  elemental function vector3_azimuthal_angle_deg (p) result (phi)
    real(default) :: phi
    type(vector3_t), intent(in) :: p
    phi = vector3_azimuthal_angle (p) / degree
  end function vector3_azimuthal_angle_deg
  elemental function vector4_azimuthal_angle_deg (p) result (phi)
    real(default) :: phi
    type(vector4_t), intent(in) :: p
    phi = vector4_azimuthal_angle (p) / degree
  end function vector4_azimuthal_angle_deg

```

The azimuthal distance of two vectors. This is the difference of the azimuthal angles, but cannot be larger than π : The result is between $-\pi < \Delta\phi \leq \pi$.

```

<Lorentz: public functions>+≡
  public :: azimuthal_distance

<Lorentz: interfaces>+≡
  interface azimuthal_distance
    module procedure vector3_azimuthal_distance
    module procedure vector4_azimuthal_distance
  end interface

<Lorentz: procedures>+≡
  elemental function vector3_azimuthal_distance (p, q) result (dphi)
    real(default) :: dphi
    type(vector3_t), intent(in) :: p,q
    dphi = vector3_azimuthal_angle (q) - vector3_azimuthal_angle (p)
    if (dphi <= -pi) then
      dphi = dphi + twopi
    else if (dphi > pi) then
      dphi = dphi - twopi
    end if
  end function vector3_azimuthal_distance
  elemental function vector4_azimuthal_distance (p, q) result (dphi)
    real(default) :: dphi
    type(vector4_t), intent(in) :: p,q
    dphi = vector3_azimuthal_distance &

```

```

(space_part (p), space_part (q))
end function vector4_azimuthal_distance

```

The same in degrees:

```

<Lorentz: public functions>+≡
public :: azimuthal_distance_deg

<Lorentz: interfaces>+≡
interface azimuthal_distance_deg
  module procedure vector3_azimuthal_distance_deg
  module procedure vector4_azimuthal_distance_deg
end interface

<Lorentz: procedures>+≡
elemental function vector3_azimuthal_distance_deg (p, q) result (dphi)
  real(default) :: dphi
  type(vector3_t), intent(in) :: p,q
  dphi = vector3_azimuthal_distance (p, q) / degree
end function vector3_azimuthal_distance_deg
elemental function vector4_azimuthal_distance_deg (p, q) result (dphi)
  real(default) :: dphi
  type(vector4_t), intent(in) :: p,q
  dphi = vector4_azimuthal_distance (p, q) / degree
end function vector4_azimuthal_distance_deg

```

The polar angle is defined $0 \leq \theta \leq \pi$. Note that ATAN2 has the reversed order of arguments: ATAN2(Y,X). Here, x is the 3-component while y is the transverse momentum which is always nonnegative. Therefore, the result is nonnegative as well.

```

<Lorentz: public functions>+≡
public :: polar_angle

<Lorentz: interfaces>+≡
interface polar_angle
  module procedure polar_angle_vector3
  module procedure polar_angle_vector4
end interface

<Lorentz: procedures>+≡
elemental function polar_angle_vector3 (p) result (theta)
  real(default) :: theta
  type(vector3_t), intent(in) :: p
  if (any(p%p/=0)) then
    theta = atan2 (sqrt(p%p(1)**2 + p%p(2)**2), p%p(3))
  else
    theta = 0
  end if
end function polar_angle_vector3
elemental function polar_angle_vector4 (p) result (theta)
  real(default) :: theta
  type(vector4_t), intent(in) :: p
  theta = polar_angle (space_part (p))
end function polar_angle_vector4

```

This is the cosine of the polar angle: $-1 \leq \cos \theta \leq 1$.

```

(Lorentz: public functions)+≡
    public :: polar_angle_ct

(Lorentz: interfaces)+≡
    interface polar_angle_ct
        module procedure polar_angle_ct_vector3
        module procedure polar_angle_ct_vector4
    end interface

(Lorentz: procedures)+≡
    elemental function polar_angle_ct_vector3 (p) result (ct)
        real(default) :: ct
        type(vector3_t), intent(in) :: p
        if (any(p%p/=0)) then

    IL%L(1:,1:) = transpose(L%L(1:,1:))
  end function lorentz_transformation_inverse

```

9.3.8 Invariants

These are used below. The first array index is varying fastest in FORTRAN; therefore the extra minus in the odd-rank tensor epsilon.

```

<Lorentz: parameters>+≡
  integer, dimension(3,3), parameter :: delta_three = &
    & reshape( source = [ 1,0,0, 0,1,0, 0,0,1 ], &
    & shape = [3,3] )
  integer, dimension(3,3,3), parameter :: epsilon_three = &
    & reshape( source = [ 0, 0,0, 0,0,-1, 0,1,0, &

```

```

&                0, 0, 1,  0, 0, 0,  -1, 0, 0, &
&                0, -1, 0,  1, 0, 0,   0, 0, 0 ],&
&                shape = [3,3,3] )

```

This could be of some use:

```

<Lorentz: public>+≡
  public :: identity

<Lorentz: parameters>+≡
  type(lorentz_transformation_t), parameter :: &
    & identity = &
    & lorentz_transformation_t ( &
    & reshape( source = [ 1._default, 0._default, 0._default, 0._default, &
    &                0._default, 1._default, 0._default, 0._default, &
    &                0._default, 0._default, 1._default, 0._default, &
    &                0._default, 0._default, 0._default, 1._default ],&
    &                shape = [4,4] ) )

<Lorentz: public>+≡
  public :: space_reflection

<Lorentz: parameters>+≡
  type(lorentz_transformation_t), parameter :: &
    & space_reflection = &
    & lorentz_transformation_t ( &
    & reshape( source = [ 1._default, 0._default, 0._default, 0._default, &
    &                0._default, -1._default, 0._default, 0._default, &
    &                0._default, 0._default, -1._default, 0._default, &
    &                0._default, 0._default, 0._default, -1._default ],&
    &                shape = [4,4] ) )

```

Builds a unit vector orthogonal to the input vector in the xy-plane.

  abs = sqrt (p%p(1)**2 + p%p(2)**2 + p%p(3)**2)
  p = p/abs
end subroutine normalize

```

9.3.9 Boosts

We build Lorentz transformations from boosts and rotations. In both cases we can supply a three-vector which defines the axis and (hyperbolic) angle. For a boost, this is the vector $\vec{\beta} = \vec{p}/E$, such that a particle at rest with mass m is boosted to a particle with three-vector \vec{p} . Here, we have

$$\beta = \tanh \chi = p/E, \quad \gamma = \cosh \chi = E/m, \quad \beta\gamma = \sinh \chi = p/m \quad (9.1)$$

```

(Lorentz: public functions)+≡
public :: boost

```

```

(Lorentz: interfaces)+≡
interface boost
  module procedure boost_from_rest_frame
  module procedure boost_from_rest_frame_vector3
  module procedure boost_generic
  module procedure boost_canonical
end interface

```

In the first form, the argument is some four-momentum, the space part of which determines a direction, and the associated mass (which is not checked against the four-momentum). The boost vector $\gamma\vec{\beta}$ is then given by \vec{p}/m . This boosts from the rest frame of a particle to the current frame. To be explicit, if \vec{p} is the momentum of a particle and m its mass, $L(\vec{p}/m)$ is the transformation that turns $(m; \vec{0})$ into $(E; \vec{p})$. Conversely, the inverse transformation boosts a vector *into* the rest frame of a particle, in particular $(E; \vec{p})$ into $(m; \vec{0})$.

```

(Lorentz: procedures)+≡
elemental function boost_from_rest_frame (p, m) result (L)
  type(lorentz_transformation_t) :: L

```

```

    type(vector4_t), intent(in) :: p
    real(default), intent(in) :: m
    L = boost_from_rest_frame_vector3 (space_part (p), m)
end function boost_from_rest_frame
elemental function boost_from_rest_frame_vector3 (p, m) result (L)
    type(lorentz_transformation_t) :: L
    type(vector3_t), intent(in) :: p
    real(default), intent(in) :: m
    type(vector3_t) :: beta_gamma
    real(default) :: bg2, g, c
    integer :: i,j
    if (m /= 0) then
        beta_gamma = p / m
        bg2 = beta_gamma**2
    else
        bg2 = 0
    end if
    if (bg2 /= 0) then
        g = sqrt(1 + bg2); c = (g-1)/bg2
        L%L(0,0) = g
        L%L(0,1:) = beta_gamma%p
        L%L(1:,0) = L%L(0,1:)
        do i=1,3
            do j=1,3
                L%L(i,j) = delta_three(i,j) + c*beta_gamma%p(i)*beta_gamma%p(j)
            end do
        end do
    else
        L = identity
    end if
end function boost_from_rest_frame_vector3

```

A canonical boost is a boost along one of the coordinate axes, which we may supply as an integer argument. Here, $\gamma\beta$ is scalar.

(Lorentz: procedures) +=

```

    elemental function boost_canonical (beta_gamma, k) result (L)
        type(lorentz_transformation_t) :: L
        real(default), intent(in) :: beta_gamma
        integer, intent(in) :: k
        real(default) :: g
        g = sqrt(1 + beta_gamma**2)
        L = identity
        L%L(0,0) = g
        L%L(0,k) = beta_gamma
        L%L(k,0) = L%L(0,k)
        L%L(k,k) = L%L(0,0)
    end function boost_canonical

```

Instead of a canonical axis, we can supply an arbitrary axis which need not be normalized. If it is zero, return the unit matrix.

(Lorentz: procedures) +=

```

    elemental function boost_generic (beta_gamma, axis) result (L)
        type(lorentz_transformation_t) :: L
        real(default), intent(in) :: beta_gamma
        type(vector3_t), intent(in) :: axis

```

```

    if (any(axis%p/=0)) then
        L = boost_from_rest_frame_vector3 (beta_gamma * axis, axis**1)
    else
        L = identity
    end if
end function boost_generic

```

9.3.10 Rotations

For a rotation, the vector defines the rotation axis, and its length the rotation angle.

(Lorentz: public functions) +=
 public :: rotation

(Lorentz: interfaces) +=
 interface rotation
 module procedure rotation_generic
 module procedure rotation_canonical
 module procedure rotation_generic_cs
 module procedure rotation_canonical_cs
 end interface

If $\cos \phi$ and $\sin \phi$ is already known, we do not have to calculate them. Of course, the user has to ensure that $\cos^2 \phi + \sin^2 \phi = 1$, and that the given axis \mathbf{n} is normalized to one. In the second form, the length of `axis` is the rotation angle.

(Lorentz: procedures) +=
 elemental function rotation_generic_cs (cp, sp, axis) result (R)
 type(lorentz_transformation_t) :: R
 real(default), intent(in) :: cp, sp
 type(vector3_t), intent(in) :: axis
 integer :: i,j
 R = identity
 do i=1,3
 do j=1,3
 R%L(i,j) = cp*delta_three(i,j) + (1-cp)*axis%p(i)*axis%p(j) &
 & - sp*dot_product(epsilon_three(i,j,:), axis%p)
 end do
 end do
 end function rotation_generic_cs
 elemental function rotation_generic (axis) result (R)
 type(lorentz_transformation_t) :: R
 type(vector3_t), intent(in) :: axis
 real(default) :: phi
 if (any(axis%p/=0)) then
 phi = abs(axis**1)
 R = rotation_generic_cs (cos(phi), sin(phi), axis/phi)
 else
 R = identity
 end if
 end function rotation_generic

Alternatively, give just the angle and label the coordinate axis by an integer.

```

(Lorentz: procedures)+≡
  elemental function rotation_canonical_cs (cp, sp, k) result (R)
    type(lorentz_transformation_t) :: R
    real(default), intent(in) :: cp, sp
    integer, intent(in) :: k
    integer :: i,j
    R = identity
    do i=1,3
      do j=1,3
        R%L(i,j) = -sp*epsilon_three(i,j,k)
      end do
      R%L(i,i) = cp
    end do
    R%L(k,k) = 1
  end function rotation_canonical_cs
  elemental function rotation_canonical (phi, k) result (R)
    type(lorentz_transformation_t) :: R
    real(default), intent(in) :: phi
    integer, intent(in) :: k
    R = rotation_canonical_cs(cos(phi), sin(phi), k)
  end function rotation_canonical

```

This is viewed as a method for the first argument (three-vector): Reconstruct the rotation that rotates it into the second three-vector.

```

(Lorentz: public functions)+≡
  public :: rotation_to_2nd

```

9.3.11 Composite Lorentz transformations

This function returns the transformation that, given a pair of vectors $p_{1,2}$, (a) boosts from the rest frame of the c.m. system (with invariant mass m) into the lab frame where p_i are defined, and (b) turns the given axis (or the canonical vectors $\pm e_k$) in the rest frame into the directions of $p_{1,2}$ in the lab frame. Note that the energy components are not used; for a consistent result one should have $(p_1 + p_2)^2 = m^2$.

```

        np%p = matmul (p%p, L%L)
    end function prod_vector4_LT

```

9.3.13 Special Lorentz transformations

These routines have their application in the generation and extraction of angles in the phase-space sampling routine. Since this part of the program is time-critical, we calculate the composition of transformations directly instead of multiplying rotations and boosts.

This Lorentz transformation is the composition of a rotation by ϕ around the 3 axis, a rotation by θ around the 2 axis, and a boost along the 3 axis:

$$L = B_3(\beta\gamma) R_2(\theta) R_3(\phi) \quad (9.2)$$

Instead of the angles we provide sine and cosine.

```

(Lorentz: public functions)+≡
    public :: LT_compose_r3_r2_b3

(Lorentz: procedures)+≡
    elemental function LT_compose_r3_r2_b3 &
        (cp, sp, ct, st, beta_gamma) result (L)

```

9.4 Special Physics functions

Here, we declare functions that are specific for the Standard Model, including QCD: fixed and running α_s , Catani-Seymour dipole terms, loop functions, etc.

To make maximum use of this, all functions, if possible, are declared elemental (or pure, if this is not possible).

```

<sm_physics.f90>≡
  <File header>

  module sm_physics

    <Use kinds>
    use io_units
    use constants
    use diagnostics
    use physics_defs
    use lorentz

    <Standard module head>

    <SM physics: public>

    <SM physics: parameters>

    contains

    <SM physics: procedures>

  end module sm_physics

```

9.4.1 Running α_s

Then we define the coefficients of the beta function of QCD (as a reference cf. the Particle Data Group), where n_f is the number of active flavors in two different schemes:

$$\beta_0 = 11 - \frac{2}{3}n_f \quad (9.5)$$

$$\beta_1 = 51 - \frac{19}{3}n_f \quad (9.6)$$

$$\beta_2 = 2857 - \frac{5033}{9}n_f + \frac{325}{27}n_f^2 \quad (9.7)$$

$$b_0 = \frac{1}{12\pi} (11C_A - 2n_f) \quad (9.8)$$

$$b_1 = \frac{1}{24\pi^2} (17C_A^2 - 5C_An_f - 3C_Fn_f) \quad (9.9)$$

$$b_2 = \frac{1}{(4\pi)^3} \left(\frac{2857}{54}C_A^3 - \frac{1415}{54}C_A^2n_f - \frac{205}{18}C_AC_Fn_f + C_F^2n_f + \frac{79}{54}C_An_f^{**2} + \frac{11}{9}C_Fn_f^{**2} \right) \quad (9.10)$$

```

9.4.3 Mathematical Functions

The dilogarithm. This simplified version is bound to double precision, and restricted to argument values less or equal to unity, so we do not need complex algebra. The wrapper converts it to default precision (which is, of course, a no-op if double=default).

The routine calculates the dilogarithm through mapping on the area where there is a quickly convergent series (adapted from an F77 routine by Hans Kuijf, 1988): Map x such that x is not in the neighbourhood of 1. Note that $|z| = -\ln(1-x)$ is always smaller than 1.10, but $\frac{1 \cdot 10^{19}}{19!} \text{Bernoulli}_{19} = 2.7 \times 10^{-15}$.

end function run_bb

```

9.4.6 Functions for Catani-Seymour dipoles

For the automated Catani-Seymour dipole subtraction, we need the following functions.

```

<SM physics: public>+≡
  public :: ff_dipole

<SM physics: procedures>+≡
  pure subroutine ff_dipole (v_ijk,y_ijk,p_ij,pp_k,p_i,p_j,p_k)
    type(vector4_t), intent(in) :: p_i, p_j, p_k
    type(vector4_t), intent(out) :: p_ij, pp_k
    real(kind=default), intent(out) :: y_ijk
    real(kind=default) :: z_i
    real(kind=default), intent(out) :: v_ijk
    z_i = (p_i*p_k) / ((p_k*p_j) + (p_k*p_i))
    y_ijk = (p_i*p_j) / ((p_i*p_j) + (p_i*p_k) + (p_j*p_k))
    p_ij = p_i + p_j - y_ijk/(1.0_default - y_ijk) * p_k
    pp_k = (1.0/(1.0_default - y_ijk)) * p_k
    !!! We don't multiply by alpha_s right here:
    v_ijk = 8.0_default * PI * CF * &
      (2.0 / (1.0 - z_i*(1.0 - y_ijk)) - (1.0 + z_i))
  end subroutine ff_dipole

<SM physics: public>+≡
  public :: fi_dipole

<SM physics: procedures>+≡
  pure subroutine fi_dipole (v_ija,x_ija,p_ij,pp_a,p_i,p_j,p_a)
    type(vector4_t), intent(in) :: p_i, p_j, p_a
    type(vector4_t), intent(out) :: p_ij, pp_a
    real(kind=default), intent(out) :: x_ija
    real(kind=default) :: z_i
    real(kind=default), intent(out) :: v_ija
    z_i = (p_i*p_a) / ((p_a*p_j) + (p_a*p_i))
    x_ija = ((p_i*p_a) + (p_j*p_a) - (p_i*p_j)) &
      / ((p_i*p_a) + (p_j*p_a))
    p_ij = p_i + p_j - (1.0_default - x_ija) * p_a
    pp_a = x_ija * p_a
    !!! We don't not multiply by alpha_s right here:
    v_ija = 8.0_default * PI * CF * &
      (2.0 / (1.0 - z_i + (1.0 - x_ija)) - (1.0 + z_i)) / x_ija
  end subroutine fi_dipole

<SM physics: public>+≡
  public :: if_dipole

<SM physics: procedures>+≡
  pure subroutine if_dipole (v_kja,u_j,p_aj,pp_k,p_k,p_j,p_a)
    type(vector4_t), intent(in) :: p_k, p_j, p_a
    type(vector4_t), intent(out) :: p_aj, pp_k
    real(kind=default), intent(out) :: u_j
    real(kind=default) :: x_kja
    real(kind=default), intent(out) :: v_kja
    u_j = (p_a*p_j) / ((p_a*p_j) + (p_a*p_k))

```

```

x_kja = ((p_a*p_k) + (p_a*p_j) - (p_j*p_k)) &
/ ((p_a*p_j) + (p_a*p_k))
p_aj = x_kja * p_a
pp_k = p_k + p_j - (1.0_default - x_kja) * p_a
v_kja = 8.0_default * PI * CF * &
(2.0 / (1.0 - x_kja + u_j) - (1.0 + x_kja)) / x_kja
end subroutine if_dipole

```

This function depends on a variable number of final state particles whose kinematics all get changed by the initial-initial dipole insertion.

<SM physics: public>+≡

public :: ii_dipole

<SM physics: procedures>+≡

```

pure subroutine ii_dipole (v_jab,v_j,p_in,p_out,flag_1or2)
  type(vector4_t), dimension(:), intent(in) :: p_in
  type(vector4_t), dimension(size(p_in)-1), intent(out) :: p_out
  logical, intent(in) :: flag_1or2
  real(kind=default), intent(out) :: v_j
  real(kind=default), intent(out) :: v_jab
  type(vector4_t) :: p_a, p_b, p_j
  type(vector4_t) :: k, kk
  type(vector4_t) :: p_aj
  real(kind=default) :: x_jab
  integer :: i
  !!! flag_1or2 decides whether this a 12 or 21 dipole
  if (flag_1or2) then
    p_a = p_in(1)
    p_b = p_in(2)
  else
    p_b = p_in(1)
    p_a = p_in(2)
  end if
  !!! We assume that the unresolved particle has always the last
  !!! momentum
  p_j = p_in(size(p_in))
  x_jab = ((p_a*p_b) - (p_a*p_j) - (p_b*p_j)) / (p_a*p_b)
  v_j = (p_a*p_j) / (p_a * p_b)
  p_aj = x_jab * p_a
  k = p_a + p_b - p_j
  kk = p_aj + p_b
  do i = 3, size(p_in)-1
    p_out(i) = p_in(i) - 2.0*((k+kk)*p_in(i))/((k+kk)*(k+kk)) * (k+kk) + &
(2.0 * (k*p_in(i)) / (k*k)) * kk
  end do
  if (flag_1or2) then
    p_out(1) = p_aj
    p_out(2) = p_b
  else
    p_out(1) = p_b
    p_out(2) = p_aj
  end if
  v_jab = 8.0_default * PI * CF * &
(2.0 / (1.0 - x_jab) - (1.0 + x_jab)) / x_jab

```

```
end subroutine ii_dipole
```

9.4.7 Distributions for integrated dipoles and such

The Dirac delta distribution, modified for Monte-Carlo sampling:

```
<SM physics: public>+≡
  public :: delta

<SM physics: procedures>+≡
  elemental function delta (x,eps) result (z)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: z
    if (x > 1.0_default - eps) then
      z = 1.0_default/eps
    else
      z = 0
    end if
  end function delta
```

The $+$ -distribution, $P_+(x) = \left(\frac{1}{1-x}\right)_+$, for the regularization of soft-collinear singularities. The constant part for the Monte-Carlo sampling is the integral over the splitting function divided by the weight for the WHIZARD numerical integration over the interval.

```
<SM physics: public>+≡
  public :: plus_distr

<SM physics: procedures>+≡
  elemental function plus_distr (x,eps) result (plusr)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: plusr
    if (x > (1.0_default - eps)) then
      plusr = log(eps)/eps
    else
      plusr = one/(one-x)
    end if
  end function plus_distr
```

The splitting function in $D = 4$ dimensions, regularized as $+$ -distributions if necessary:

$$P^{qq}(x) = P^{\bar{q}q}(x) = C_F \cdot \left(\frac{1+x^2}{1-x}\right)_+ \quad (9.13)$$

$$P^{qg}(x) = P^{\bar{q}g}(x) = C_F \cdot \frac{1+(1-x)^2}{x} \quad (9.14)$$

$$P^{gg}(x) = P^{g\bar{q}}(x) = T_R \cdot [x^2 + (1-x)^2] \quad (9.15)$$

$$P^{gg}(x) = 2C_A \left[\left(\frac{1}{1-x}\right)_+ + \frac{1-x}{x} - 1 + x(1-x) \right] + \delta(1-x) \left(\frac{11}{6}C_A - \frac{2}{3}N_f T_R \right) \quad (9.16)$$

Since the number of flavors summed over in the gluon splitting function might depend on the physics case under consideration it is implemented as an input variable.

```

⟨SM physics: public⟩+≡
  public :: pqq

⟨SM physics: procedures⟩+≡
  elemental function pqq (x,eps) result (pqqx)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: pqqx
    if (x > (1.0_default - eps)) then
      pqqx = (eps-one)/two + two*log(eps)/eps - three*(eps-one)/eps/two
    else
      pqqx = (one + x**2)/(one-x)
    end if
    pqqx = CF * pqqx
  end function pqq

⟨SM physics: public⟩+≡
  public :: pgq

⟨SM physics: procedures⟩+≡
  elemental function pgq (x) result (pgqx)
    real(kind=default), intent(in) :: x
    real(kind=default) :: pgqx
    pgqx = TR * (x**2 + (one - x)**2)
  end function pgq

⟨SM physics: public⟩+≡
  public :: pqg

⟨SM physics: procedures⟩+≡
  elemental function pqg (x) result (pqgx)
    real(kind=default), intent(in) :: x
    real(kind=default) :: pqgx
    pqgx = CF * (one + (one - x)**2) / x
  end function pqg

⟨SM physics: public⟩+≡
  public :: pgg

⟨SM physics: procedures⟩+≡
  elemental function pgg (x, nf, eps) result (pggx)
    real(kind=default), intent(in) :: x, nf, eps
    real(kind=default) :: pggx
    pggx = two * CA * ( plus_distr (x, eps) + (one-x)/x - one + &
      x*(one-x)) + delta (x, eps) * gamma_g(nf)
  end function pgg

```

For the qq and gg cases, there exist “regularized” versions of the splitting functions:

$$P_{\text{reg}}^{qq}(x) = -C_F \cdot (1+x) \quad (9.17)$$

$$P_{\text{reg}}^{gg}(x) = 2C_A \left[\frac{1-x}{x} - 1 + x(1-x) \right] \quad (9.18)$$

$$(9.19)$$

$\langle SM \text{ physics: public} \rangle + \equiv$
`public :: pqq_reg`

$\langle SM \text{ physics: procedures} \rangle + \equiv$
`elemental function pqq_reg (x) result (pqqregx)`
`real(kind=default), intent(in) :: x`
`real(kind=default) :: pqqregx`
`pqqregx = - CF * (one + x)`
`end function pqq_reg`

$\langle SM \text{ physics: public} \rangle + \equiv$
`public :: pgg_reg`

$\langle SM \text{ physics: procedures} \rangle + \equiv$
`elemental function pgg_reg (x) result (pggregx)`
`real(kind=default), intent(in) :: x`
`real(kind=default) :: pggregx`
`pggregx = two * CA * ((one - x)/x - one + x*(one - x))`
`end function pgg_reg`

Here, we collect the expressions needed for integrated Catani-Seymour dipoles, and the so-called flavor kernels. We always distinguish between the “ordinary” Catani-Seymour version, and the one including a phase-space slicing parameter, α .

The standard flavor kernels \overline{K}^{ab} are:

$$\overline{K}^{qg}(x) = \overline{K}^{\bar{q}g}(x) = P^{qg}(x) \log((1-x)/x) + CF \times x \quad (9.20)$$

$$\overline{K}^{gq}(x) = \overline{K}^{g\bar{q}}(x) = P^{gq}(x) \log((1-x)/x) + TR \times 2x(1-x) \quad (9.21)$$

$$\overline{K}^{qq} = C_F \left[\left(\frac{2}{1-x} \log \frac{1-x}{x} \right)_+ - (1+x) \log((1-x)/x) + (1-x) \right] - (5 - \pi^2) \cdot C_F \cdot \delta(1-x) \quad (9.22)$$

$$\overline{K}^{gg} = 2C_A \left[\left(\frac{1}{1-x} \log \frac{1-x}{x} \right)_+ + \left(\frac{1-x}{x} - 1 + x(1-x) \right) \log((1-x)/x) \right] - \delta(1-x) \left[(f \right. \quad (9.23)$$

$\langle SM \text{ physics: public} \rangle + \equiv$
`public :: kbarqg`

$\langle SM \text{ physics: procedures} \rangle + \equiv$
`function kbarqg (x) result (kbarqgx)`
`real(kind=default), intent(in) :: x`
`real(kind=default) :: kbarqgx`
`kbarqgx = pqg(x) * log((one-x)/x) + CF * x`
`end function kbarqg`

```

⟨SM physics: public⟩+≡
  public :: kbargq

⟨SM physics: procedures⟩+≡
  function kbargq (x) result (kbargqx)
    real(kind=default), intent(in) :: x
    real(kind=default) :: kbargqx
    kbargqx = pgq(x) * log((one-x)/x) + two * TR * x * (one - x)
  end function kbargq

⟨SM physics: public⟩+≡
  public :: kbarqq

⟨SM physics: procedures⟩+≡
  function kbarqq (x,eps) result (kbarqqx)
    real(kind=default), intent(in) :: x, eps
    real(kind=default) :: kbarqqx
    kbarqqx = CF*(log_plus_distr(x,eps) - (one+x) * log((one-x)/x) + (one - &
      x) - (five - pi**2) * delta(x,eps))
  end function kbarqq

⟨SM physics: public⟩+≡
  public :: kbargg

⟨SM physics: procedures⟩+≡

```

9.5 QCD Coupling

We provide various distinct implementations of the QCD coupling. In this module, we define an abstract data type and three implementations: fixed, running with $\alpha_s(M_Z)$ as input, and running with Λ_{QCD} as input. We use the functions defined above in the module `sm_physics` but provide a common interface. Later modules may define additional implementations.

```
<sm_qcd.f90>≡  
<File header>  
  
module sm_qcd  
  
  <Use kinds>  
  use io_units  
  use format_defs, only: FMT_12  
  use unit_tests  
  use diagnostics  
  use md5  
  use physics_defs  
  use sm_physics  
  
  <Standard module head>  
  
  <SM qcd: public>  
  
  <SM qcd: types>  
  
  <SM qcd: interfaces>  
  
  contains  
  
  <SM qcd: procedures>  
  
  <SM qcd: tests>  
  
end module sm_qcd
```

9.5.1 Coupling: Abstract Data Type

This is the abstract version of the QCD coupling implementation.

```
<SM qcd: public>≡  
  public :: alpha_qcd_t  
  
<SM qcd: types>≡  
  type, abstract :: alpha_qcd_t  
  contains  
    <SM qcd: alpha qcd: TBP>  
  end type alpha_qcd_t
```

There must be an output routine.

```
<SM qcd: alpha qcd: TBP>≡  
  procedure (alpha_qcd_write), deferred :: write
```

```

⟨SM qcd: interfaces⟩≡
  abstract interface
    subroutine alpha_qcd_write (object, unit)
      import
      class(alpha_qcd_t), intent(in) :: object
      integer, intent(in), optional :: unit
    end subroutine alpha_qcd_write
  end interface

```

This method computes the running coupling, given a certain scale. All parameters (reference value, order of the approximation, etc.) must be set before calling this.

```

⟨SM qcd: alpha qcd: TBP⟩+≡
  procedure (alpha_qcd_get), deferred :: get

⟨SM qcd: interfaces⟩+≡
  abstract interface
    function alpha_qcd_get (alpha_qcd, scale) result (alpha)
      import
      class(alpha_qcd_t), intent(in) :: alpha_qcd
      real(default), intent(in) :: scale
      real(default) :: alpha
    end function alpha_qcd_get
  end interface

```

9.5.2 Fixed Coupling

In this version, the α_s value is fixed, the `scale` argument of the `get` method is ignored. There is only one parameter, the value. By default, this is the value at M_Z .

```

⟨SM qcd: public⟩+≡
  public :: alpha_qcd_fixed_t

⟨SM qcd: types⟩+≡
  type, extends (alpha_qcd_t) :: alpha_qcd_fixed_t
    real(default) :: val = ALPHA_QCD_MZ_REF
  contains
    ⟨SM qcd: alpha qcd fixed: TBP⟩
  end type alpha_qcd_fixed_t

```

Output.

```

⟨SM qcd: alpha qcd fixed: TBP⟩≡
  procedure :: write => alpha_qcd_fixed_write

⟨SM qcd: procedures⟩≡
  subroutine alpha_qcd_fixed_write (object, unit)
    class(alpha_qcd_fixed_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(3x,A)") "QCD parameters (fixed coupling):"
    write (u, "(5x,A," // FMT_12 // ")") "alpha = ", object%val
  end subroutine alpha_qcd_fixed_write

```

```
end subroutine alpha_qcd_fixed_write
```

Calculation: the scale is ignored in this case.

```
<SM qcd: alpha qcd fixed: TBP>+≡
  procedure :: get => alpha_qcd_fixed_get

<SM qcd: procedures>+≡
  function alpha_qcd_fixed_get (alpha_qcd, scale) result (alpha)
    class(alpha_qcd_fixed_t), intent(in) :: alpha_qcd
    real(default), intent(in) :: scale
    real(default) :: alpha
    alpha = alpha_qcd%val
  end function alpha_qcd_fixed_get
```

9.5.3 Running Coupling

In this version, the α_s value runs relative to the value at a given reference scale. There are two parameters: the value of this scale (default: M_Z), the value of α_s at this scale, and the number of effective flavors. Furthermore, we have the order of the approximation.

```
<SM qcd: public>+≡
  public :: alpha_qcd_from_scale_t

<SM qcd: types>+≡
  type, extends (alpha_qcd_t) :: alpha_qcd_from_scale_t
    real(default) :: mu_ref = MZ_REF
    real(default) :: ref = ALPHA_QCD_MZ_REF
    integer :: order = 0
    integer :: nf = 5
  contains
    <SM qcd: alpha qcd from scale: TBP>
  end type alpha_qcd_from_scale_t
```

Output.

```
<SM qcd: alpha qcd from scale: TBP>≡
  procedure :: write => alpha_qcd_from_scale_write

<SM qcd: procedures>+≡
  subroutine alpha_qcd_from_scale_write (object, unit)
    class(alpha_qcd_from_scale_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(3x,A)") "QCD parameters (running coupling):"
    write (u, "(5x,A," // FMT_12 // ")") "Scale mu = ", object%mu_ref
    write (u, "(5x,A," // FMT_12 // ")") "alpha(mu) = ", object%ref
    write (u, "(5x,A,I0)") "LL order = ", object%order
    write (u, "(5x,A,I0)") "N(flav) = ", object%nf
  end subroutine alpha_qcd_from_scale_write
```

Calculation: here, we call the function for running α_s that was defined in `sm_physics` above. The function does not take into account thresholds, so the number of flavors should be the correct one for the chosen scale. Normally, this should be the Z boson mass.

```

⟨SM qcd: alpha qcd from scale: TBP⟩+≡
  procedure :: get => alpha_qcd_from_scale_get

⟨SM qcd: procedures⟩+≡
  function alpha_qcd_from_scale_get (alpha_qcd, scale) result (alpha)
    class(alpha_qcd_from_scale_t), intent(in) :: alpha_qcd
    real(default), intent(in) :: scale
    real(default) :: alpha
    alpha = running_as (scale, &
      alpha_qcd%ref, alpha_qcd%mu_ref, alpha_qcd%order, &
      real (alpha_qcd%nf, kind=default))
  end function alpha_qcd_from_scale_get

```

9.5.4 Running Coupling, determined by Λ_{QCD}

In this version, the input are the value Λ_{QCD} and the order of the approximation.

```

⟨SM qcd: public⟩+≡
  public :: alpha_qcd_from_lambda_t

⟨SM qcd: types⟩+≡
  type, extends (alpha_qcd_t) :: alpha_qcd_from_lambda_t
    real(default) :: lambda = LAMBDA_QCD_REF
    integer :: order = 0
    integer :: nf = 5
  contains
    ⟨SM qcd: alpha qcd from lambda: TBP⟩
  end type alpha_qcd_from_lambda_t

```

Output.

```

⟨SM qcd: alpha qcd from lambda: TBP⟩≡
  procedure :: write => alpha_qcd_from_lambda_write

⟨SM qcd: procedures⟩+≡
  subroutine alpha_qcd_from_lambda_write (object, unit)
    class(alpha_qcd_from_lambda_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(3x,A)") "QCD parameters (Lambda_QCD as input):"
    write (u, "(5x,A," // FMT_12 // ")") "Lambda_QCD = ", object%lambda
    write (u, "(5x,A,I0)") "LL order = ", object%order
    write (u, "(5x,A,I0)") "N(flv) = ", object%nf
  end subroutine alpha_qcd_from_lambda_write

```

Calculation: here, we call the second function for running α_s that was defined in `sm_physics` above. The Λ value should be the one that is appropriate for the chosen number of effective flavors. Again, thresholds are not incorporated.

```

⟨SM qcd: alpha qcd from lambda: TBP⟩+≡
  procedure :: get => alpha_qcd_from_lambda_get

```

```

⟨SM qcd: procedures⟩+≡
function alpha_qcd_from_lambda_get (alpha_qcd, scale) result (alpha)
  class(alpha_qcd_from_lambda_t), intent(in) :: alpha_qcd
  real(default), intent(in) :: scale
  real(default) :: alpha
  alpha = running_as_lam (real (alpha_qcd%nf, kind=default), scale, &
    alpha_qcd%lambda, alpha_qcd%order)
end function alpha_qcd_from_lambda_get

```

9.5.5 Wrapper type

We could get along with a polymorphic QCD type, but a monomorphic wrapper type with a polymorphic component is easier to handle and probably safer (w.r.t. compiler bugs). However, we keep the object transparent, so we can set the type-specific parameters directly (by a `dispatch` routine).

```

⟨SM qcd: public⟩+≡
  public :: qcd_t
⟨SM qcd: types⟩+≡
  type :: qcd_t
    class(alpha_qcd_t), allocatable :: alpha
    character(32) :: md5sum = ""
  contains
    ⟨SM qcd: qcd: TBP⟩
  end type qcd_t

```

Output. We first print the polymorphic `alpha` which contains a headline, then any extra components.

```

⟨SM qcd: qcd: TBP⟩≡
  procedure :: write => qcd_write
⟨SM qcd: procedures⟩+≡
  subroutine qcd_write (qcd, unit, show_md5sum)
    class(qcd_t), intent(in) :: qcd
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: show_md5sum
    logical :: show_md5
    integer :: u
    u = given_output_unit (unit)
    show_md5 = .true.; if (present (show_md5sum)) show_md5 = show_md5sum
    if (allocated (qcd%alpha)) then
      call qcd%alpha%write (u)
    else
      write (u, "(3x,A)") "QCD parameters (coupling undefined)"
    end if
    if (show_md5 .and. qcd%md5sum /= "") &
      write (u, "(5x,A,A,A)") "md5sum = '", qcd%md5sum, "'"
  end subroutine qcd_write

```

Compute a MD5 sum for the `alpha_s` setup. This is done by writing them to a temporary file, using a standard format.

```

⟨SM qcd: qcd: TBP⟩+≡

```

```

    procedure :: compute_alphas_md5sum => qcd_compute_alphas_md5sum
<SM qcd: procedures>+≡
    subroutine qcd_compute_alphas_md5sum (qcd)
        class(qcd_t), intent(inout) :: qcd
        integer :: unit
        if (allocated (qcd%alpha)) then
            unit = free_unit ()
            open (unit, status="scratch", action="readwrite")
            call qcd%alpha%write (unit)
            rewind (unit)
            qcd%md5sum = md5sum (unit)
            close (unit)
        end if
    end subroutine qcd_compute_alphas_md5sum

```

Retrieve the MD5 sum of the qcd setup.

```

<SM qcd: qcd: TBP>+≡
    procedure :: get_md5sum => qcd_get_md5sum
<SM qcd: procedures>+≡
    function qcd_get_md5sum (qcd) result (md5sum)
        character(32) :: md5sum
        class(qcd_t), intent(inout) :: qcd
        md5sum = qcd%md5sum
    end function qcd_get_md5sum

```

9.5.6 Unit tests

```

<SM qcd: public>+≡
    public :: sm_qcd_test
<SM qcd: tests>≡
    subroutine sm_qcd_test (u, results)

Chapter 10

Quantum Field Theory Concepts

The objects and methods defined here implement concepts and data for the underlying quantum field theory that we use for computing matrix elements and processes.

model_data Fields and coupling parameters, operators as vertex structures, for a specific model.

helicities Types and methods for spin density matrices.

colors Dealing with colored particles, using the color-flow representation.

flavors PDG codes and particle properties, depends on the model.

quantum_states Quantum numbers and density matrices for entangled particle systems.

10.1 Model Data

These data represent a specific Lagrangian in numeric terms. That is, we have the fields with their quantum numbers, the masses, widths and couplings as numerical values, and the vertices as arrays of fields.

We do not store the relations between coupling parameters. They should be represented by expressions for evaluation, implemented as Sindarin objects in a distinct data structure. Neither do we need the algebraic structure of vertices. The field content of vertices is required for the sole purpose of setting up phase space.

10.1.1 Physics Parameters

Couplings, masses, and widths are physics parameters. Each parameter has a unique name (used, essentially, for diagnostics output and debugging) and a value. The value may be a real or a complex number, so we provide to

implementations of an abstract type.

```

<Model data: public>≡
    public :: modelpar_data_t

<Model data: types>≡
    type, abstract :: modelpar_data_t
        private
            type(string_t) :: name
        contains
            <Model data: par data: TBP>
        end type modelpar_data_t

    type, extends (modelpar_data_t) :: modelpar_real_t
        private
            real(default) :: value
        contains
            <Model data: par real: TBP>
        end type modelpar_real_t

    type, extends (modelpar_data_t) :: modelpar_complex_t
        private
            complex(default) :: value
        contains
            <Model data: par complex: TBP>
        end type modelpar_complex_t

```

Output for diagnostics. Non-advancing.

```

<Model data: par data: TBP>≡
    procedure :: write => par_write

<Model data: procedures>≡
    subroutine par_write (par, unit)
        class(modelpar_data_t), intent(in) :: par
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit)
        write (u, "(1x,A,1x,A)", advance="no") char (par%name), "= "
        select type (par)
            class is (modelpar_real_t)
                write (u, "(" // FMT_19 // ")", advance="no") par%value
            class is (modelpar_complex_t)
                write (u, "(" // FMT_19 // ",1x,'+',1x," // FMT_19 // ",1x,'I')", &
                    advance="no") par%value
        end select
    end subroutine par_write

```

Pretty-printed on separate line, with fixed line length

```

<Model data: par data: TBP>+≡
    procedure :: show => par_show

<Model data: procedures>+≡
    subroutine par_show (par, l, u)
        class(modelpar_data_t), intent(in) :: par
        integer, intent(in) :: l, u

```

```

character(len=1) :: buffer
buffer = par%name
select type (par)
class is (modelpar_real_t)
    write (u, "(4x,A,1x,'=',1x," // FMT_19 // ")") buffer, par%value
class is (modelpar_complex_t)
    write (u, "(4x,A,1x,'=',1x," // FMT_19 // ",1x,'+',1x," &
        // FMT_19 // ",1x,'I')") buffer, par%value
end select
end subroutine par_show

```

Initialize with name and value. The type depends on the argument type. If the type does not match, the value is converted following Fortran rules.

<Model data: par data: TBP>+≡

```

generic :: init => modelpar_data_init_real, modelpar_data_init_complex
procedure, private :: modelpar_data_init_real
procedure, private :: modelpar_data_init_complex

```

<Model data: procedures>+≡

```

pure subroutine modelpar_data_init_real (par, name, value)
    class(modelpar_data_t), intent(out) :: par
    type(string_t), intent(in) :: name
    real(default), intent(in) :: value
    par%name = name
    par = value
end subroutine modelpar_data_init_real

pure subroutine modelpar_data_init_complex (par, name, value)
    class(modelpar_data_t), intent(out) :: par
    type(string_t), intent(in) :: name
    complex(default), intent(in) :: value
    par%name = name
    par = value
end subroutine modelpar_data_init_complex

```

Modify the value. We assume that the parameter has been initialized. The type (real or complex) must not be changed, and the name is also fixed.

<Model data: par data: TBP>+≡

```

generic :: assignment(=) => modelpar_data_set_real, modelpar_data_set_complex
procedure, private :: modelpar_data_set_real
procedure, private :: modelpar_data_set_complex

```

<Model data: procedures>+≡

    class is (modelpar_real_t)
      par%value = value
    class is (modelpar_complex_t)
      par%value = value
  end select
end subroutine modelpar_data_set_complex

```

Return the parameter name.

```

⟨Model data: par data: TBP⟩+≡
  procedure :: get_name => modelpar_data_get_name

⟨Model data: procedures⟩+≡
  function modelpar_data_get_name (par) result (name)
    class(modelpar_data_t), intent(in) :: par
    type(string_t) :: name
    name = par%name
  end function modelpar_data_get_name

```

Return the value. In case of a type mismatch, follow Fortran conventions.

```

⟨Model data: par data: TBP⟩+≡
  procedure :: get_real => modelpar_data_get_real
  procedure :: get_complex => modelpar_data_get_complex

⟨Model data: procedures⟩+≡
  elemental function modelpar_data_get_real (par) result (value)
    class(modelpar_data_t), intent(in), target :: par
    real(default) :: value
    select type (par)
      class is (modelpar_real_t)
        value = par%value
      class is (modelpar_complex_t)
        value = par%value
    end select
  end function modelpar_data_get_real

  elemental function modelpar_data_get_complex (par) result (value)
    class(modelpar_data_t), intent(in), target :: par
    complex(default) :: value
    select type (par)
      class is (modelpar_real_t)
        value = par%value
      class is (modelpar_complex_t)
        value = par%value
    end select
  end function modelpar_data_get_complex

```

Return a pointer to the value. This makes sense only for matching types.

```

⟨Model data: par data: TBP⟩+≡
  procedure :: get_real_ptr => modelpar_data_get_real_ptr
  procedure :: get_complex_ptr => modelpar_data_get_complex_ptr

```

```

<Model data: procedures>+≡
function modelpar_data_get_real_ptr (par) result (ptr)
  class(modelpar_data_t), intent(in), target :: par
  real(default), pointer :: ptr
  select type (par)
  class is (modelpar_real_t)
    ptr => par%value
  class default
    ptr => null ()
  end select
end function modelpar_data_get_real_ptr

function modelpar_data_get_complex_ptr (par) result (ptr)
  class(modelpar_data_t), intent(in), target :: par
  complex(default), pointer :: ptr
  select type (par)
  class is (modelpar_complex_t)
    ptr => par%value
  class default
    ptr => null ()
  end select
end function modelpar_data_get_complex_ptr

```

10.1.2 Field Data

The field-data type holds all information that pertains to a particular field (or particle) within a particular model. Information such as spin type, particle code etc. is stored within the object itself, while mass and width are associated to parameters, otherwise assumed zero.

```

<Model data: public>+≡
  public :: field_data_t

<Model data: types>+≡
  type :: field_data_t
    private
    type(string_t) :: longname
    integer :: pdg = UNDEFINED
    logical :: visible = .true.
    logical :: parton = .false.
    logical :: gauge = .false.
    logical :: left_handed = .false.
    logical :: right_handed = .false.
    logical :: has_anti = .false.
    logical :: p_is_stable = .true.
    logical :: p_decays_isotropically = .false.
    logical :: p_decays_diagonal = .false.
    logical :: a_is_stable = .true.
    logical :: a_decays_isotropically = .false.
    logical :: a_decays_diagonal = .false.
    logical :: p_polarized = .false.
    logical :: a_polarized = .false.
    type(string_t), dimension(:), allocatable :: name, anti
    type(string_t) :: tex_name, tex_anti

```

```

integer :: spin_type = UNDEFINED
integer :: isospin_type = 1
integer :: charge_type = 1
integer :: color_type = 1

```

10.1.3 Vertex data

The vertex object contains an array of particle-data pointers, for which we need a separate type. (We could use the flavor type defined in another module.)

The program does not (yet?) make use of vertex definitions, so they are not stored here.

(Model data: types)+≡

```

type :: field_data_p
  type(field_data_t), pointer :: p => null ()
end type field_data_p

```

```

<Model data: types>+≡
  type :: vertex_t
    private
    logical :: trilinear
    integer, dimension(:), allocatable :: pdg
    type(field_data_p), dimension(:), allocatable :: prt
    contains
    <Model data: vertex: TBP>
  end type vertex_t

<Model data: vertex: TBP>≡
  procedure :: write => vertex_write

<Model data: procedures>+≡
  subroutine vertex_write (vtx, unit)
    class(vertex_t), intent(in) :: vtx
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit)
    write (u, "(3x,A)", advance="no") "vertex"
    do i = 1, size (vtx%prt)
      if (associated (vtx%prt(i)%p)) then
        write (u, "(1x,A)", advance="no") &
          '"" // char (vtx%prt(i)%p%get_name (vtx%pdg(i) < 0)) &
          // '""
      else
        write (u, "(1x,I7)", advance="no") vtx%pdg(i)
      end if
    end do
    write (u, *)
  end subroutine vertex_write

```

Initialize using PDG codes. The model is used for finding particle data pointers associated with the pdg codes.

```

<Model data: vertex: TBP>+≡
  procedure :: init => vertex_init

<Model data: procedures>+≡
  subroutine vertex_init (vtx, pdg, model)
    class(vertex_t), intent(out) :: vtx
    integer, dimension(:), intent(in) :: pdg
    type(model_data_t), intent(in), target, optional :: model
    integer :: i
    allocate (vtx%pdg (size (pdg)))
    allocate (vtx%prt (size (pdg)))
    vtx%trilinear = size (pdg) == 3
    vtx%pdg = pdg
    if (present (model)) then
      do i = 1, size (pdg)
        vtx%prt(i)%p => model%get_field_ptr (pdg(i))
      end do
    end if
  end subroutine vertex_init

```

Copy vertex: we must reassign the field-data pointer to a new model.

```

<Model data: vertex: TBP>+≡
  procedure :: copy_from => vertex_copy_from

<Model data: procedures>+≡
  subroutine vertex_copy_from (vtx, old_vtx, new_model)
    class(vertex_t), intent(out) :: vtx
    class(vertex_t), intent(in) :: old_vtx
    type(model_data_t), intent(in), target, optional :: new_model
    call vtx%init (old_vtx%pdg, new_model)
  end subroutine vertex_copy_from

```

Single-particle lookup: Given a particle code, we return matching codes if present, otherwise zero. Actually, we return the antiparticles of the matching codes, as appropriate for computing splittings.

```

<Model data: vertex: TBP>+≡
  procedure :: get_match => vertex_get_match

<Model data: procedures>+≡
  subroutine vertex_get_match (vtx, pdg1, pdg2)
    class(vertex_t), intent(in) :: vtx
    integer, intent(in) :: pdg1
    integer, dimension(:), allocatable, intent(out) :: pdg2
    integer :: i, j
    do i = 1, size (vtx%pdg)
      if (vtx%pdg(i) == pdg1) then
        allocate (pdg2 (size (vtx%pdg) - 1))
        do j = 1, i-1
          pdg2(j) = anti (j)
        end do
        do j = i, size (pdg2)
          pdg2(j) = anti (j+1)
        end do
        exit
      end if
    end do
  contains
    function anti (i) result (pdg)
      integer, intent(in) :: i
      integer :: pdg
      if (vtx%prt(i)%p%has_antiparticle ()) then
        pdg = - vtx%pdg(i)
      else
        pdg = vtx%pdg(i)
      end if
    end function anti
  end subroutine vertex_get_match

```

To access this from the outside, we create an iterator. The iterator has the sole purpose of returning the matching particles for a given array of PDG codes.

```

<Model data: public>+≡
  public :: vertex_iterator_t

```

```

<Model data: types>+≡
  type :: vertex_iterator_t
  private
    class(model_data_t), pointer :: model => null ()
    integer, dimension(:), allocatable :: pdg
    integer :: vertex_index = 0
  contains
    procedure :: init => vertex_iterator_init
    procedure :: get_next_match => vertex_iterator_get_next_match
  end type vertex_iterator_t

```

We initialize the iterator for a particular model with the `pdg` index of the particle we are looking at.

```

<Model data: procedures>+≡
  subroutine vertex_iterator_init (it, model, pdg)
    class(vertex_iterator_t), intent(out) :: it
    class(model_data_t), intent(in), target :: model
    integer, dimension(:), intent(in) :: pdg
    it%model => model
    allocate (it%pdg (size (pdg)), source = pdg)
  end subroutine vertex_iterator_init

  subroutine vertex_iterator_get_next_match (it, pdg_match)
    class(vertex_iterator_t), intent(inout) :: it
    integer, dimension(:), allocatable, intent(out) :: pdg_match
    integer :: i, j
    do i = it%vertex_index + 1, size (it%model%vtx)
      do j = 1, size (it%pdg)
        call vertex_get_match (it%model%vtx(i), it%pdg(j), pdg_match)
        if (allocated (pdg_match)) then
          it%vertex_index = i
          return
        end if
      end do
    end do
    it%vertex_index = 0
  end subroutine vertex_iterator_get_next_match

```

10.1.4 Vertex lookup table

The vertex lookup table is a hash table: given two particle codes, we check which codes are allowed for the third one.

The size of the hash table should be large enough that collisions are rare. We first select a size based on the number of vertices (multiplied by six because all permutations count), with some margin, and then choose the smallest integer power of two larger than this.

```

<Model data: parameters>≡
  integer, parameter :: VERTEX_TABLE_SCALE_FACTOR = 60

<Model data: procedures>+≡
  function vertex_table_size (n_vtx) result (n)
    integer(i32) :: n

```

```

integer, intent(in) :: n_vtx
integer :: i, s
s = VERTEX_TABLE_SCALE_FACTOR * n_vtx
n = 1
do i = 1, 31
  n = ishft (n, 1)
  s = ishft (s,-1)
  if (s == 0) exit
end do
end function vertex_table_size

```

The specific hash function takes two particle codes (arbitrary integers) and returns a 32-bit integer. It makes use of the universal function `hash` which operates on a byte array.

```

<Model data: procedures>+≡
function hash2 (pdg1, pdg2)
  integer(i32) :: hash2
  integer, intent(in) :: pdg1, pdg2
  integer(i8), dimension(1) :: mold
  hash2 = hash (transfer ([pdg1, pdg2], mold))
end function hash2

```

Each entry in the vertex table stores the two particle codes and an array of possibilities for the third code.

```

<Model data: types>+≡
type :: vertex_table_entry_t
  private
  integer :: pdg1 = 0, pdg2 = 0
  integer :: n = 0
  integer, dimension(:), allocatable :: pdg3
end type vertex_table_entry_t

```

The vertex table:

```

<Model data: types>+≡
type :: vertex_table_t
  type(vertex_table_entry_t), dimension(:), allocatable :: entry
  integer :: n_collisions = 0
  integer(i32) :: mask
  contains
  <Model data: vertex table: TBP>
end type vertex_table_t

```

Output.

```

<Model data: vertex table: TBP>≡
procedure :: write => vertex_table_write

<Model data: procedures>+≡
subroutine vertex_table_write (vt, unit)
  class(vertex_table_t), intent(in) :: vt
  integer, intent(in), optional :: unit
  integer :: u, i
  character(9) :: size_pdg3

```

```

u = given_output_unit (unit)
write (u, "(A)") "vertex hash table:"
write (u, "(A,I7)") " size = ", size (vt%entry)
write (u, "(A,I7)") " used = ", count (vt%entry%  
n /= 0)
write (u, "(A,I7)") " coll = ", vt%n_collisions
do i = lbound (vt%entry, 1), ubound (vt%entry, 1)
  if (vt%entry(i)%  
n /= 0) then
    write (size_pdg3, "(I7)") size (vt%entry(i)%pdg3)
    write (u, "(A,1x,I7,1x,A,2(1x,I7),A," // &
      size_pdg3 // "(1x,I7))") &
      " ", i, ":", vt%entry(i)%pdg1, &
      vt%entry(i)%pdg2, "->", vt%entry(i)%pdg3
  end if
end do
end subroutine vertex_table_write

```

Initializing the vertex table: This is done in two passes. First, we scan all permutations for all vertices and count the number of entries in each bucket of the hashtable. Then, the buckets are allocated accordingly and filled.

Collision resolution is done by just incrementing the hash value until an empty bucket is found. The vertex table size is fixed, since we know from the beginning the number of entries.

```

<Model data: vertex table: TBP>+≡
  procedure :: init => vertex_table_init

<Model data: procedures>+≡
  subroutine vertex_table_init (vt, prt, vtx)

10.1.5 Model Data Record

This type collects the model data as defined above.

We deliberately implement the parameter arrays as pointer arrays. We thus avoid keeping track of TARGET attributes.

```

<Model data: public>+≡
    public :: model_data_t

<Model data: types>+≡
    type :: model_data_t
    private
    type(string_t) :: name
    type(modelpar_real_t), dimension(:), pointer :: par_real => null ()
    type(modelpar_complex_t), dimension(:), pointer :: par_complex => null ()
    type(field_data_t), dimension(:), allocatable :: field
    type(vertex_t), dimension(:), allocatable :: vtx
    type(vertex_table_t) :: vt
    contains
    <Model data: model data: TBP>
end type model_data_t

```

Finalizer, deallocate pointer arrays.

```

<Model data: model data: TBP>≡
    procedure :: final => model_data_final

<Model data: procedures>+≡
    subroutine model_data_final (model)
        class(model_data_t), intent(inout) :: model
        deallocate (model%par_real)
        deallocate (model%par_complex)
    end subroutine model_data_final

```

Output. The signature matches the signature of the high-level `model_write` procedure, so some of the options don't actually apply.

```

<Model data: model data: TBP>+≡
    procedure :: write => model_data_write

```

```

<Model data: procedures>+≡

10.2 Helicities

This module defines types and tools for dealing with helicity information.

```
(helicities.f90)≡  
  ⟨File header⟩
```

```
  module helicities  
  
    use io_units  
  
    ⟨Standard module head⟩  
  
    ⟨Helicities: public⟩  
  
    ⟨Helicities: types⟩  
  
    ⟨Helicities: interfaces⟩  
  
    contains  
  
    ⟨Helicities: procedures⟩  
  
  end module helicities
```

10.2.1 Helicity types

Helicities may be defined or undefined, corresponding to a polarized or unpolarized state. Each helicity is actually a pair of helicities, corresponding to an entry in the spin density matrix. Obviously, diagonal entries are distinguished. In addition, we have a ghost flag that would apply to FP ghosts in particular.

```
⟨Helicities: public⟩≡  
  public :: helicity_t  
  
⟨Helicities: types⟩≡  
  type :: helicity_t  
    private  
    logical :: defined = .false.  
    integer :: h1, h2  
    logical :: ghost = .false.  
  end type helicity_t
```

Initializers:

```
⟨Helicities: public⟩+≡  
  public :: helicity_init  
  
⟨Helicities: interfaces⟩≡  
  interface helicity_init  
    module procedure helicity_init0, helicity_init0g  
    module procedure helicity_init1, helicity_init1g  
    module procedure helicity_init2, helicity_init2g  
  end interface
```

```

<Helicities: procedures>+≡
  elemental subroutine helicity_init0 (hel)
    type(helicity_t), intent(out) :: hel
  end subroutine helicity_init0

  elemental subroutine helicity_init0g (hel, ghost)
    type(helicity_t), intent(out) :: hel
    logical, intent(in) :: ghost
    hel%ghost = ghost
  end subroutine helicity_init0g

  elemental subroutine helicity_init1 (hel, h)
    type(helicity_t), intent(out) :: hel
    integer, intent(in) :: h
    hel%defined = .true.
    hel%h1 = h
    hel%h2 = h
  end subroutine helicity_init1

  elemental subroutine helicity_init1g (hel, h, ghost)
    type(helicity_t), intent(out) :: hel
    integer, intent(in) :: h
    logical, intent(in) :: ghost
    call helicity_init1 (hel, h)
    hel%ghost = ghost
  end subroutine helicity_init1g

  elemental subroutine helicity_init2 (hel, h2, h1)
    type(helicity_t), intent(out) :: hel
    integer, intent(in) :: h1, h2
    hel%defined = .true.
    hel%h2 = h2
    hel%h1 = h1
  end subroutine helicity_init2

  elemental subroutine helicity_init2g (hel, h2, h1, ghost)
    type(helicity_t), intent(out) :: hel
    integer, intent(in) :: h1, h2
    logical, intent(in) :: ghost
    call helicity_init2 (hel, h2, h1)
    hel%ghost = ghost
  end subroutine helicity_init2g

```

Set the ghost property separately:

```

<Helicities: public>+≡
  public :: helicity_set_ghost

<Helicities: procedures>+≡
  elemental subroutine helicity_set_ghost (hel, ghost)
    type(helicity_t), intent(inout) :: hel
    logical, intent(in) :: ghost
    hel%ghost = ghost
  end subroutine helicity_set_ghost

```

Undefine:

```
<Helicities: public>+≡
  public :: helicity_undefine

<Helicities: procedures>+≡
  elemental subroutine helicity_undefine (hel)
    type(helicity_t), intent(inout) :: hel
    hel%defined = .false.
    hel%ghost = .false.
  end subroutine helicity_undefine
```

Diagonalize by removing the second entry (use with care!)

```
<Helicities: public>+≡
  public :: helicity_diagonalize

<Helicities: procedures>+≡
  elemental subroutine helicity_diagonalize (hel)
    type(helicity_t), intent(inout) :: hel
    hel%h2 = hel%h1
  end subroutine helicity_diagonalize
```

Output (no linebreak). No output if undefined.

```
<Helicities: public>+≡
  public :: helicity_write

<Helicities: procedures>+≡
  subroutine helicity_write (hel, unit)
    type(helicity_t), intent(in) :: hel
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    if (hel%defined) then
      if (hel%ghost) then
        write (u, "(A)", advance="no") "h*"
      else
        write (u, "(A)", advance="no") "h("
      end if
      write (u, "(IO)", advance="no") hel%h1
      if (hel%h1 /= hel%h2) then
        write (u, "(A)", advance="no") "|"
        write (u, "(IO)", advance="no") hel%h2
      end if
      write (u, "(A)", advance="no") ")"
    else if (hel%ghost) then
      write (u, "(A)", advance="no") "h*"
    end if
  end subroutine helicity_write
```

Binary I/O. Write contents only if defined.

```
<Helicities: public>+≡
  public :: helicity_write_raw
  public :: helicity_read_raw
```

```

<Helicities: procedures>+≡
  subroutine helicity_write_raw (hel, u)
    type(helicity_t), intent(in) :: hel

    integer, intent(in) :: u
    integer, intent(out), optional :: iostat
    read (u, iostat=iostat) hel%defined
    if (hel%defined) then
      read (u, iostat=iostat) hel%h1, hel%h2
      read (u, iostat=iostat) hel%ghost
    end if
  end subroutine helicity_read_raw

```

10.2.2 Predicates

Check if the helicity is defined:

```

<Helicities: public>+≡
  public :: helicity_is_defined

<Helicities: procedures>+≡
  elemental function helicity_is_defined (hel) result (defined)
    logical :: defined
    type(helicity_t), intent(in) :: hel
    defined = hel%defined
  end function helicity_is_defined

```

Return true if the two helicities are equal or the particle is unpolarized:

```

<Helicities: public>+≡
  public :: helicity_is_diagonal

<Helicities: procedures>+≡
  elemental function helicity_is_diagonal (hel) result (diagonal)
    logical :: diagonal
    type(helicity_t), intent(in) :: hel
    if (hel%defined) then
      diagonal = hel%h1 == hel%h2
    else
      diagonal = .true.
    end if
  end function helicity_is_diagonal

```

Return the ghost flag

```

<Helicities: public>+≡
  public :: helicity_is_ghost

```

```

<Helicities: procedures>+≡
  elemental function helicity_is_ghost (hel) result (ghost)
    logical :: ghost
    type(helicity_t), intent(in) :: hel
    ghost = hel%ghost
  end function helicity_is_ghost

```

10.2.3 Accessing contents

This returns a two-element array and thus cannot be elemental. The result is unpredictable if the helicity is undefined.

```

<Helicities: public>+≡
  public :: helicity_get

<Helicities: procedures>+≡
  pure function helicity_get (hel) result (h)
    integer, dimension(2) :: h
    type(helicity_t), intent(in) :: hel
    h(1) = hel%h2
    h(2) = hel%h1
  end function helicity_get

```

10.2.4 Comparisons

When comparing helicities, if either one is undefined, they are considered to match. In other words, an unpolarized particle matches any polarization. In the `dmatch` variant, it matches only diagonal helicity.

The ghost flag is ignored when matching, but matters when testing for equality.

```

<Helicities: public>+≡
  public :: operator(.match.)
  public :: operator(.dmatch.)
  public :: operator(==)
  public :: operator(/=)

<Helicities: interfaces>+≡
  interface operator(.match.)
    module procedure helicity_match
  end interface
  interface operator(.dmatch.)
    module procedure helicity_match_diagonal
  end interface
  interface operator(==)
    module procedure helicity_eq
  end interface
  interface operator(/=)
    module procedure helicity_neq
  end interface

```

```

<Helicities: procedures>+=
  elemental function helicity_match (hel1, hel2) result (eq)
    logical :: eq
    type(helicity_t), intent(in) :: hel1, hel2
    if (hel1%defined .and. hel2%defined) then
      eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
    else
      eq = .true.
    end if
  end function helicity_match

  elemental function helicity_match_diagonal (hel1, hel2) result (eq)
    logical :: eq
    type(helicity_t), intent(in) :: hel1, hel2
    if (hel1%defined .and. hel2%defined) then
      eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
    else if (hel1%defined) then
      eq = hel1%h1 == hel1%h2
    else if (hel2%defined) then
      eq = hel2%h1 == hel2%h2
    else
      eq = .true.
    end if
  end function helicity_match_diagonal

<Helicities: procedures>+=
  elemental function helicity_eq (hel1, hel2) result (eq)
    logical :: eq
    type(helicity_t), intent(in) :: hel1, hel2
    if (hel1%defined .and. hel2%defined) then
      eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2) &
        .and. (hel1%ghost .eqv. hel2%ghost)
    else if (.not. hel1%defined .and. .not. hel2%defined) then
      eq = hel1%ghost .eqv. hel2%ghost
    else
      eq = .false.
    end if
  end function helicity_eq

<Helicities: procedures>+=
  elemental function helicity_neq (hel1, hel2) result (neq)
    logical :: neq
    type(helicity_t), intent(in) :: hel1, hel2
    if (hel1%defined .and. hel2%defined) then
      neq = (hel1%h1 /= hel2%h1) .or. (hel1%h2 /= hel2%h2) &
        .or. (hel1%ghost .neqv. hel2%ghost)
    else if (.not. hel1%defined .and. .not. hel2%defined) then
      neq = hel1%ghost .neqv. hel2%ghost
    else
      neq = .true.
    end if
  end function helicity_neq

```

10.2.5 Tools

Merge two helicity objects by taking the first entry from the first and the second entry from the second argument. Makes sense only if the input helicities were defined and diagonal. The handling of ghost flags is not well-defined; one should verify beforehand that they match.

```
<Helicities: public>+≡
    public :: operator(.merge.)

<Helicities: interfaces>+≡
    interface operator(.merge.)
        module procedure merge_helicities
    end interface

<Helicities: procedures>+≡
    elemental function merge_helicities (hel1, hel2) result (hel)
        type(helicity_t) :: hel
        type(helicity_t), intent(in) :: hel1, hel2
        if (helicity_is_defined (hel1) .and. helicity_is_defined (hel2)) then
            call helicity_init2g (hel, hel2%h1, hel1%h1, hel1%ghost)
        else if (helicity_is_defined (hel1)) then
            hel = hel1
        else if (helicity_is_defined (hel2)) then
            hel = hel2
        end if
    end function merge_helicities
```

10.3 Colors

This module defines a type and tools for dealing with color information.

Each particle can have zero or more (in practice, usually not more than two) color indices. Color indices are positive; flow direction can be determined from the particle nature.

While parton shower matrix elements are diagonal in color, some special applications (e.g., subtractions for NLO matrix elements) require non-diagonal color matrices.

```
<colors.f90>≡  
  <File header>  
  
  module colors  
  
    <Use kinds>  
    use io_units  
    use unit_tests  
    use diagnostics  
  
    <Standard module head>  
  
    <Colors: public>  
  
    <Colors: types>  
  
    <Colors: interfaces>  
  
    contains  
  
    <Colors: procedures>  
  
    <Colors: tests>  
  
  end module colors
```

10.3.1 The color type

A particle may have an arbitrary number of color indices (in practice, from zero to two, but more are possible). This object acts as a container.

The fact that color comes as an array prohibits elemental procedures in some places. (May add interfaces and multi versions where necessary.)

The color may be undefined; this corresponds to unallocated arrays.

NOTE: Due to a compiler bug in nagfor 5.2, we do not use allocatable but fixed-size arrays with dimension 2. Only nonzero entries count. This may be more efficient anyway, but gives up some flexibility. However, the squaring algorithm currently works only for singlets, (anti)triplets and octets anyway, so two components are enough.

```
<Colors: public>≡  
  public :: color_t  
  
<Colors: types>≡  
  type :: color_t
```

```

    private
    integer, dimension(2) :: c1 = 0, c2 = 0
    logical :: ghost = .false.
end type color_t

```

Initializers:

```

<Colors: public>+≡
    public :: color_init

<Colors: interfaces>≡
    interface color_init
        module procedure color_init_undefined, color_init_undefined_ghost
        module procedure color_init_array, color_init_array_ghost
        module procedure color_init_arrays, color_init_arrays_ghost
    end interface

```

Undefined color: array remains unallocated

```

<Colors: procedures>≡
    pure subroutine color_init_undefined (col)
        type(color_t), intent(out) :: col
    end subroutine color_init_undefined

    pure subroutine color_init_undefined_ghost (col, ghost)
        type(color_t), intent(out) :: col
        logical, intent(in) :: ghost
        col%ghost = ghost
    end subroutine color_init_undefined_ghost

```

This defines color from an arbitrary length color array, suitable for any representation. We may have two color arrays (non-diagonal matrix elements). This cannot be elemental. The third version assigns an array of colors, using a two-dimensional array as input.

```

<Colors: procedures>+≡
    pure subroutine color_init_array (col, c1)
        type(color_t), intent(out) :: col
        integer, dimension(:), intent(in) :: c1
        col%c1 = pack (c1, c1 /= 0, [0,0])
        col%c2 = col%c1
    end subroutine color_init_array

    pure subroutine color_init_array_ghost (col, c1, ghost)
        type(color_t), intent(out) :: col
        integer, dimension(:), intent(in) :: c1
        logical, intent(in) :: ghost
        call color_init_array (col, c1)
        col%ghost = ghost
    end subroutine color_init_array_ghost

    pure subroutine color_init_arrays (col, c1, c2)
        type(color_t), intent(out) :: col
        integer, dimension(:), intent(in) :: c1, c2
        if (size (c1) == size (c2)) then

```

```

        col%c1 = pack (c1, c1 /= 0, [0,0])
        col%c2 = pack (c2, c2 /= 0, [0,0])
    else if (size (c1) /= 0) then
        col%c1 = pack (c1, c1 /= 0, [0,0])
        col%c2 = col%c1
    else if (size (c2) /= 0) then
        col%c1 = pack (c2, c2 /= 0, [0,0])
        col%c2 = col%c1
    end if
end subroutine color_init_arrays

pure subroutine color_init_arrays_ghost (col, c1, c2, ghost)
    type(color_t), intent(out) :: col
    integer, dimension(:), intent(in) :: c1, c2
    logical, intent(in) :: ghost
    call color_init_arrays (col, c1, c2)
    col%ghost = ghost
end subroutine color_init_arrays_ghost

```

This version is restricted to singlets, triplets, antitriplets, and octets: The input contains the color and anticolor index, each of the may be zero.

```

<Colors: public>+≡
    public :: color_init_col_acl

<Colors: procedures>+≡
    elemental subroutine color_init_col_acl (col, col_in, acl_in)
        type(color_t), intent(out) :: col
        integer, intent(in) :: col_in, acl_in
        integer, dimension(0) :: null_array
        select case (col_in)
        case (0)
            select case (acl_in)
            case (0)
                call color_init_array (col, null_array)
            case default
                call color_init_array (col, [-acl_in])
            end select
        case default
            select case (acl_in)
            case (0)
                call color_init_array (col, [col_in])
            case default
                call color_init_array (col, [col_in, -acl_in])
            end select
        end select
    end subroutine color_init_col_acl

```

This version is used for the external interface. We convert a fixed-size array of colors (for each particle) to the internal form by packing only the nonzero entries.

```

<Colors: public>+≡
    public :: color_init_from_array

```

```

<Colors: interfaces>+≡
  interface color_init_from_array
    module procedure color_init_from_array1, color_init_from_array1g
    module procedure color_init_from_array2, color_init_from_array2g
  end interface

```

```

<Colors: procedures>+≡
  pure subroutine color_init_from_array1 (col, c1)
    type(color_t), intent(out) :: col
    integer, dimension(:), intent(in) :: c1
    logical, dimension(size(c1)) :: mask
    mask = c1 /= 0
    col%c1 = pack (c1, mask, col%c1)
    col%c2 = col%c1
  end subroutine color_init_from_array1

  pure subroutine color_init_from_array1g (col, c1, ghost)
    type(color_t), intent(out) :: col
    integer, dimension(:), intent(in) :: c1
    logical, intent(in) :: ghost
    call color_init_from_array1 (col, c1)
    col%ghost = ghost
  end subroutine color_init_from_array1g

  pure subroutine color_init_from_array2 (col, c1)
    integer, dimension(:, :), intent(in) :: c1
    type(color_t), dimension(size(c1,2)), intent(out) :: col
    integer :: i
    do i = 1, size (c1,2)
      call color_init_from_array1 (col(i), c1(:,i))
    end do
  end subroutine color_init_from_array2

  pure subroutine color_init_from_array2g (col, c1, ghost)
    integer, dimension(:, :), intent(in) :: c1
    type(color_t), dimension(size(c1,2)), intent(out) :: col
    logical, intent(in), dimension(:) :: ghost
    call color_init_from_array2 (col, c1)
    col%ghost = ghost
  end subroutine color_init_from_array2g

```

Set the ghost property

```

<Colors: public>+≡
  public :: color_set_ghost

<Colors: procedures>+≡
  elemental subroutine color_set_ghost (col, ghost)
    type(color_t), intent(inout) :: col
    logical, intent(in) :: ghost
    col%ghost = ghost
  end subroutine color_set_ghost

```

Undefine the color state:

```

<Colors: public>+≡
    public :: color_undefine

<Colors: procedures>+≡
    elemental subroutine color_undefine (col, undefine_ghost)
        type(color_t), intent(inout) :: col
        logical, intent(in), optional :: undefine_ghost
        col%c1 = 0
        col%c2 = 0
        if (present (undefine_ghost)) then
            if (undefine_ghost) col%ghost = .false.
        else
            col%ghost = .false.
        end if
    end subroutine color_undefine

```

Output. As dense as possible, no linebreak. If color is undefined, no output.

```

<Colors: public>+≡
    public :: color_write

<Colors: interfaces>+≡
    interface color_write
        module procedure color_write_single
        module procedure color_write_array
    end interface

<Colors: procedures>+≡
    subroutine color_write_single (col, unit)
        type(color_t), intent(in) :: col
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit); if (u < 0) return
        if (color_is_defined (col)) then
            write (u, "(A)", advance="no") "c("
            if (col%c1(1) /= 0) write (u, "(I0)", advance="no") col%c1(1)
            if (any (col%c1 /= 0)) write (u, "(1x)", advance="no")
            if (col%c1(2) /= 0) write (u, "(I0)", advance="no") col%c1(2)
            if (.not. color_is_diagonal (col)) then
                write (u, "(A)", advance="no") "|"
                if (col%c2(1) /= 0) write (u, "(I0)", advance="no") col%c2(1)
                if (any (col%c2 /= 0)) write (u, "(1x)", advance="no")
                if (col%c2(2) /= 0) write (u, "(I0)", advance="no") col%c2(2)
            end if
            write (u, "(A)", advance="no") ")"
        else if (col%ghost) then
            write (u, "(A)", advance="no") "c*"
        end if
    end subroutine color_write_single

    subroutine color_write_array (col, unit)
        type(color_t), dimension(:), intent(in) :: col
        integer, intent(in), optional :: unit
        integer :: u
        integer :: i

```

```

u = given_output_unit (unit); if (u < 0) return
write (u, "(A)", advance="no") "["
do i = 1, size (col)
    if (i > 1) write (u, "(1x)", advance="no")
    call color_write_single (col(i), u)
end do
write (u, "(A)", advance="no") "]"
end subroutine color_write_array

```

Binary I/O. For allocatable colors, this would have to be modified.

<Colors: public>+≡

```

public :: color_write_raw
public :: color_read_raw

```

<Colors: procedures>+≡

```

subroutine color_write_raw (col, u)
    type(color_t), intent(in) :: col
    integer, intent(in) :: u
    logical :: defined
    defined = color_is_defined (col) .or. color_is_ghost (col)
    write (u) defined
    if (defined) then
        write (u) col%c1, col%c2
        write (u) col%ghost
    end if
end subroutine color_write_raw

subroutine color_read_raw (col, u, iostat)
    type(color_t), intent(out) :: col
    integer, intent(in) :: u
    integer, intent(out), optional :: iostat
    logical :: defined
    read (u, iostat=iostat) defined
    if (defined) then
        read (u, iostat=iostat) col%c1, col%c2
        read (u, iostat=iostat) col%ghost
    end if
end subroutine color_read_raw

```

10.3.2 Predicates

Return the definition status

<Colors: public>+≡

```

public :: color_is_defined

```

<Colors: procedures>+≡

```

elemental function color_is_defined (col) result (defined)
    logical :: defined
    type(color_t), intent(in) :: col
    defined = any (col%c1 /= 0)
end function color_is_defined

```

Diagonal color objects have only one array allocated:

```
<Colors: public>+≡
    public :: color_is_diagonal

<Colors: procedures>+≡
    elemental function color_is_diagonal (col) result (diagonal)
        logical :: diagonal
        type(color_t), intent(in) :: col
        if (color_is_defined (col)) then
            diagonal = all (col%c1 == col%c2)
        else
            diagonal = .true.
        end if
    end function color_is_diagonal
```

Return the ghost flag

```
<Colors: public>+≡
    public :: color_is_ghost

<Colors: procedures>+≡
    elemental function color_is_ghost (col) result (ghost)
        logical :: ghost
        type(color_t), intent(in) :: col
        ghost = col%ghost
    end function color_is_ghost
```

The ghost parity: true if the color-ghost flag is set.

```
<Colors: interfaces>+≡
    interface color_ghost_parity
        module procedure color_ghost_parity0
        module procedure color_ghost_parity1
    end interface

<Colors: procedures>+≡
    pure function color_ghost_parity0 (col) result (parity)
        type(color_t), intent(in) :: col
        logical :: parity
        parity = color_is_ghost (col)
    end function color_ghost_parity0

    pure function color_ghost_parity1 (col) result (parity)
        type(color_t), dimension(:), intent(in) :: col
        logical :: parity
        logical, dimension(size(col)) :: p
        integer :: i
        forall (i = 1:size(col))
            p(i) = color_ghost_parity0 (col(i))
        end forall
        parity = mod (count (p), 2) == 1
    end function color_ghost_parity1
```

10.3.3 Accessing contents

Return the number of color indices. We assume that it is identical for both arrays.

```
(Colors: procedures)+≡  
  elemental function color_number (col) result (n)  
    integer :: n  
    type(color_t), intent(in) :: col  
    n = count (col%c1 /= 0)  
  end function color_number
```

Return the (first) color/anticolor entry (assuming that color is diagonal). The result is a positive color index.

```
(Colors: public)+≡  
  public :: color_get_col  
  public :: color_get_acl  
  
(Colors: procedures)+≡  
  elemental function color_get_col (col) result (c)  
    integer :: c  
    type(color_t), intent(in) :: col  
    integer :: i  
    do i = 1, size (col%c1)  
      if (col%c1(i) > 0) then  
        c = col%c1(i)  
        return  
      end if  
    end do  
    c = 0  
  end function color_get_col  
  
  elemental function color_get_acl (col) result (c)  
    integer :: c  
    type(color_t), intent(in) :: col  
    integer :: i  
    do i = 1, size (col%c1)  
      if (col%c1(i) < 0) then  
        c = - col%c1(i)  
        return  
      end if  
    end do  
    c = 0  
  end function color_get_acl
```

Return the color index with highest absolute value

```
(Colors: public)+≡  
  public :: color_get_max_value  
  
(Colors: interfaces)+≡  
  interface color_get_max_value  
    module procedure color_get_max_value0  
    module procedure color_get_max_value1  
    module procedure color_get_max_value2  
  end interface
```

```

<Colors: procedures>+≡
    elemental function color_get_max_value0 (col) result (cmax)
        integer :: cmax
        type(color_t), intent(in) :: col
        cmax = maxval (abs (col%c1))
    end function color_get_max_value0

    pure function color_get_max_value1 (col) result (cmax)
        integer :: cmax
        type(color_t), dimension(:), intent(in) :: col

```

Given a color array, pairwise contract the color lines in all possible ways and return the resulting array of arrays. The input color array must be diagonal, and each color should occur exactly twice, once as color and once as anticolor.

Gluon entries with equal color and anticolor are explicitly excluded.

This algorithm is generic, but for long arrays it is neither efficient, nor does it avoid duplicates. It is intended for small arrays, in particular for the state matrix of a structure-function pair.

  end function compute_color_factor

```

We have a pair of color index arrays which corresponds to a squared matrix element. We want to determine the number of color loops in this square matrix element. So we first copy the colors (stored in a single color array with a pair of color lists in each entry) to a temporary where the color indices are shifted by some offset. We then recursively follow each loop, starting at the first color that has the offset, resetting the first color index to the loop index and each further index to zero as we go. We check that (a) each color index occurs twice within the left (right) color array, (b) the loops are closed, so we always come back to a line which has the loop index.

In order for the algorithm to work we have to conjugate the colors of initial state particles (one for decays, two for scatterings) into their corresponding

anticolors of outgoing particles.

10.3.7 The Madgraph color model

This section describes the method for matrix element and color flow calculation within Madgraph.

For each Feynman diagram, the colorless amplitude for a specified helicity and momentum configuration (in- and out- combined) is computed:

$$A_d(p, h) \quad (10.1)$$

Inserting color, the squared matrix element for definite helicity and momentum is

$$M^2(p, h) = \sum_{dd'} A_d(p, h) C_{dd'} A_{d'}^*(p, h) \quad (10.2)$$

where $C_{dd'}$ describes the color interference of the two diagrams A_d and $A_{d'}$, which is independent of momentum and helicity and can be calculated for each Feynman diagram pair by reducing it to the corresponding color graph. Obviously, one could combine all diagrams with identical color structure, such that the index d runs only over different color graphs. For colorless diagrams all elements of $C_{dd'}$ are equal to unity.

The hermitian matrix $C_{dd'}$ is diagonalized once and for all, such that it can be written in the form

$$C_{dd'} = \sum_{\lambda} c_d^{\lambda} \lambda c_{d'}^{\lambda*}, \quad (10.3)$$

where the eigenvectors c_d are normalized,

$$\sum_d |c_d^{\lambda}|^2 = 1, \quad (10.4)$$

and the λ values are the corresponding eigenvalues. In the colorless case, this means $c_d = 1/\sqrt{N_d}$ for all diagrams (N_d = number of diagrams), and $\lambda = N_d$ is the only nonzero eigenvalue.

Consequently, the squared matrix element for definite helicity and momentum can also be written as

$$M^2(p, h) = \sum_{\lambda} A_{\lambda}(p, h) \lambda A_{\lambda}^*(p, h) \quad (10.5)$$

with

$$A_\lambda(p, h) = \sum_d c_d^\lambda A_d(p, h). \quad (10.6)$$

For generic spin density matrices, this is easily generalized to

$$M^2(p, h, h') = \sum_\lambda A_\lambda(p, h) \lambda A_\lambda(p, h')^* \quad (10.7)$$

To determine the color flow probabilities of a given momentum-helicity configuration, the color flow amplitudes are calculated as

$$a_f(p, h) = \sum_d \beta_d^f A_d(p, h), \quad (10.8)$$

where the coefficients β_d^f describe the amplitude for a given Feynman diagram (or color graph) d to correspond to a definite color flow f . They are computed from $C_{dd'}$ by transforming this matrix into the color flow basis and neglecting all off-diagonal elements. Again, these coefficients do not depend on momentum or helicity and can therefore be calculated in advance. This gives the color flow transition matrix

$$F^f(p, h, h') = a_f(p, h) a_f^*(p, h') \quad (10.9)$$

which is assumed diagonal in color flow space and is separate from the color-summed transition matrix M^2 . They are, however, equivalent (up to a factor) to leading order in $1/N_c$, and using the color flow transition matrix is appropriate for matching to hadronization.

Note that the color flow transition matrix is not normalized at this stage. To make use of it, we have to fold it with the in-state density matrix to get a pseudo density matrix

$$\hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h'_{\text{out}}) = \sum_{h_{\text{in}} h'_{\text{in}}} F^f(p, h, h') \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}) \quad (10.10)$$

which gets a meaning only after contracted with projections on the outgoing helicity states k_{out} , given as linear combinations of helicity states with the unitary coefficient matrix $c(k_{\text{out}}, h_{\text{out}})$. Then the probability of finding color flow f when the helicity state k_{out} is measured is given by

$$P^f(p, k_{\text{out}}) = Q^f(p, k_{\text{out}}) / \sum_f Q^f(p, k_{\text{out}}) \quad (10.11)$$

where

$$Q^f(p, k_{\text{out}}) = \sum_{h_{\text{out}} h'_{\text{out}}} c(k_{\text{out}}, h_{\text{out}}) \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h'_{\text{out}}) c^*(k_{\text{out}}, h'_{\text{out}}) \quad (10.12)$$

However, if we can assume that the out-state helicity basis is the canonical one, we can throw away the off diagonal elements in the color flow density matrix and normalize the ones on the diagonal to obtain

$$P^f(p, h_{\text{out}}) = \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h_{\text{out}}) / \sum_f \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h_{\text{out}}) \quad (10.13)$$

Finally, the color-summed out-state density matrix is computed by the scattering formula

$$\rho_{\text{out}}(p, h_{\text{out}}, h'_{\text{out}}) = \sum_{h_{\text{in}} h'_{\text{in}}} M^2(p, h, h') \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}) \quad (10.14)$$

$$= \sum_{h_{\text{in}} h'_{\text{in}} \lambda} A_{\lambda}(p, h) \lambda A_{\lambda}(p, h')^* \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}), \quad (10.15)$$

The trace of ρ_{out} is the squared matrix element, summed over all internal degrees of freedom. To get the squared matrix element for a definite helicity k_{out} and color flow f , one has to project the density matrix onto the given helicity state and multiply with $P^f(p, k_{\text{out}})$.

For diagonal helicities the out-state density reduces to

$$\rho_{\text{out}}(p, h_{\text{out}}) = \sum_{h_{\text{in}} \lambda} \lambda |A_{\lambda}(p, h)|^2 \rho_{\text{in}}(p, h_{\text{in}}). \quad (10.16)$$

Since no basis transformation is involved, we can use the normalized color flow probability $P^f(p, h_{\text{out}})$ and express the result as

$$\rho_{\text{out}}^f(p, h_{\text{out}}) = \rho_{\text{out}}(p, h_{\text{out}}) P^f(p, h_{\text{out}}) \quad (10.17)$$

$$= \sum_{h_{\text{in}} \lambda} \frac{|a^f(p, h)|^2}{\sum_f |a^f(p, h)|^2} \lambda |A_{\lambda}(p, h)|^2 \rho_{\text{in}}(p, h_{\text{in}}). \quad (10.18)$$

From these considerations, the following calculation strategy can be derived:

- Before the first event is generated, the color interference matrix $C_{dd'}$ is computed and diagonalized, so the eigenvectors c_d^{λ} , eigenvalues λ and color flow coefficients β_d^f are obtained. In practice, these calculations are done when the matrix element code is generated, and the results are hardcoded in the matrix element subroutine as **DATA** statements.
- For each event, one loops over helicities once and stores the matrices $A_{\lambda}(p, h)$ and $a^f(p, h)$. The allowed color flows, helicity combinations and eigenvalues are each labeled by integer indices, so one has to store complex matrices of dimension $N_{\lambda} \times N_h$ and $N_f \times N_h$, respectively.
- The further strategy depends on the requested information.
 1. If colorless diagonal helicity amplitudes are required, the eigenvalues $A_{\lambda}(p, h)$ are squared, summed with weight λ , and the result contracted with the in-state probability vector $\rho_{\text{in}}(p, h_{\text{in}})$. The result is a probability vector $\rho_{\text{out}}(p, h_{\text{out}})$.
 2. For colored diagonal helicity amplitudes, the color coefficients $a^f(p, h)$ are also squared and used as weights to obtain the color-flow probability vector $\rho_{\text{out}}^f(p, h_{\text{out}})$.
 3. For colorless non-diagonal helicity amplitudes, we contract the tensor product of $A_{\lambda}(p, h)$ with $A_{\lambda}(p, h')$, weighted with λ , with the correlated in-state density matrix, to obtain a correlated out-state density matrix.

4. In the general (colored, non-diagonal) case, we do the same as in the colorless case, but return the un-normalized color flow density matrix $\hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h'_{\text{out}})$ in addition. When the relevant helicity basis is known, the latter can be used by the caller program to determine flow probabilities. (In reality, we assume the canonical basis and reduce the correlated out-state density to its diagonal immediately.)

10.4 Flavors: Particle properties

This module contains a type for holding the flavor code, and all functions that depend on the model, i.e., that determine particle properties.

The PDG code is packed in a special **flavor** type. (This prohibits meaningless operations, and it allows for a different implementation, e.g., some non-PDG scheme internally, if appropriate at some point.) In addition, the flavor object holds a pointer to a **particle_data** object which is centrally stored (as part of a physics model). In this way, all particle data can be accessed using just the **flv** object without having to carry them around.

The pointer component imposes a technical restriction: Assignment of flavor objects cannot be used, directly or indirectly, in pure, and thus in elemental procedures.

10.4.1 The flavor type

The flavor type is an integer representing the PDG code, or undefined (zero). Negative codes represent ant flavors.

For full generality, and analogy with helicity and color, we allow for non-diagonal flavor indices in density matrices. This is probably academic; an obscure application is the definition of proper isospin states.

Further properties of the given flavor can be retrieved via the particle-data pointer, if it is associated.

```

<Flavors: public>≡
    public :: flavor_t

<Flavors: types>≡
    type :: flavor_t
    private
    integer :: f = UNDEFINED
    type(field_data_t), pointer :: field_data => null ()
end type flavor_t

```

Initializer form. If the model is assigned, the procedure is impure, therefore we have to define a separate array version.

```

<Flavors: public>+≡
    public :: flavor_init

<Flavors: interfaces>≡
    interface flavor_init

!       pdg = aval
!       allocate (flv (size (pdg)))
!       call flavor_init (flv, pdg, model)
!   end subroutine flavor_init_aval_model

```

Undefine the flavor state:

```

<Flavors: public>+≡
public :: flavor_undefine

<Flavors: procedures>+≡
elemental subroutine flavor_undefine (flv)
type(flavor_t), intent(inout) :: flv
flv%f = UNDEFINED
flv%field_data => null ()
end subroutine flavor_undefine

```

Output: dense, no linebreak

```

<Flavors: public>+≡
    public :: flavor_write

<Flavors: procedures>+≡
    subroutine flavor_write (flv, unit)
        type(flavor_t), intent(in) :: flv
        integer, intent(in), optional :: unit
        integer :: u
        u = given_output_unit (unit); if (u < 0) return
        if (associated (flv%field_data)) then
            write (u, "(A)", advance="no") "f("
        else
            write (u, "(A)", advance="no") "p("
        end if
        write (u, "(I0)", advance="no") flv%f
        write (u, "(A)", advance="no") ")"
    end subroutine flavor_write

```

Binary I/O. Currently, the model information is not written/read, so after reading the particle-data pointer is empty.

```

<Flavors: public>+≡
    public :: flavor_write_raw
    public :: flavor_read_raw

<Flavors: procedures>+≡
    subroutine flavor_write_raw (flv, u)
        type(flavor_t), intent(in) :: flv
        integer, intent(in) :: u
        write (u) flv%f
    end subroutine flavor_write_raw

    subroutine flavor_read_raw (flv, u, iostat)
        type(flavor_t), intent(out) :: flv
        integer, intent(in) :: u
        integer, intent(out), optional :: iostat
        read (u, iostat=iostat) flv%f
    end subroutine flavor_read_raw

```

Assignment

Default assignment of flavor objects is possible, but cannot be used in pure procedures, because a pointer assignment is involved.

Assign the particle pointer separately. This cannot be elemental, so we define a scalar and an array version explicitly. We refer to an array of flavors, not an array of models.

```

<Flavors: public>+≡
    public :: flavor_set_model

<Flavors: interfaces>+≡
    interface flavor_set_model
        module procedure flavor_set_model_single
        module procedure flavor_set_model_array
    end interface

```

```

        module procedure flavor_set_model_array2
    end interface
<Flavors: procedures>+≡
    subroutine flavor_set_model_single (flv, model)
        type(flavor_t), intent(inout) :: flv

        end do
    end subroutine flavor_set_model_array2

```

Predicates

Return the definition status

```

<Flavors: public>+≡
    public :: flavor_is_defined

<Flavors: procedures>+≡
    elemental function flavor_is_defined (flv) result (defined)
        logical :: defined
        type(flavor_t), intent(in) :: flv
        defined = flv%f /= UNDEFINED
    end function flavor_is_defined

```

Check for valid flavor (including undefined):

```

<Flavors: public>+≡
    public :: flavor_is_valid

<Flavors: procedures>+≡
    elemental function flavor_is_valid (flv) result (valid)
        logical :: valid

```

```

        type(flavor_t), intent(in) :: flv
        valid = flv%f /= INVALID
    end function flavor_is_valid

```

Return true if the particle-data pointer is associated. (Debugging aid)

```

<Flavors: public>+≡
    public :: flavor_is_associated

<Flavors: procedures>+≡
    elemental function flavor_is_associated (flv) result (flag)
        logical :: flag
        type(flavor_t), intent(in) :: flv
        flag = associated (flv%field_data)
    end function flavor_is_associated

```

Accessing contents

With the exception of the PDG code, all particle properties are accessible only via the `field_data` pointer. If this is unassigned, some access function will crash.

Return the flavor as an integer

```

<Flavors: public>+≡
    public :: flavor_get_pdg

<Flavors: procedures>+≡
    elemental function flavor_get_pdg (flv) result (f)
        integer :: f
        type(flavor_t), intent(in) :: flv
        f = flv%f
    end function flavor_get_pdg

```

Return the flavor of the antiparticle

```

<Flavors: public>+≡
    public :: flavor_get_pdg_anti

<Flavors: procedures>+≡
    elemental function flavor_get_pdg_anti (flv) result (f)
        integer :: f
        type(flavor_t), intent(in) :: flv
        if (associated (flv%field_data)) then
            if (flv%field_data%has_antiparticle ()) then
                f = -flv%f
            else
                f = flv%f
            end if
        else
            f = 0
        end if
    end function flavor_get_pdg_anti

```

Absolute value:

```
(Flavors: public)+≡  
    public :: flavor_get_pdg_abs  
  
(Flavors: procedures)+≡  
    elemental function flavor_get_pdg_abs (flv) result (f)

Tools

Merge two flavor indices. This works only if both are equal or either one is undefined, because we have no off-diagonal flavor entries. Otherwise, generate an invalid flavor.

We cannot use elemental procedures because of the pointer component.

```

<Flavors: public>+≡
  public :: operator(.merge.)

<Flavors: interfaces>+≡
  interface operator(.merge.)
    module procedure merge_flavors0
    module procedure merge_flavors1
  end interface

```

```
end interface
```

(Flavors: procedures)+≡

```
function merge_flavors0 (flv1, flv2) result (flv)
  type(flavor_t) :: flv
  type(flavor_t), intent(in) :: flv1, flv2
  if (flavor_is_defined (flv1) .and. flavor_is_defined (flv2)) then
    if (flv1 == flv2) then
      flv = flv1
    else
      flv%f = INVALID
    end if
  else if (flavor_is_defined (flv1)) then
    flv = flv1
  else if (flavor_is_defined (flv2)) then
    flv = flv2
  end if
end function merge_flavors0

  type(flavor_t), dimension(:), intent(in) :: flv1, flv2
  type(flavor_t), dimension(size(flv1)) :: flv
  integer :: i
  do i = 1, size (flv1)
    flv(i) = flv1(i) .merge. flv2(i)
  end do
end function merge_flavors1
```

Generate consecutive color indices for a given flavor. The indices are counted starting with the stored value of *c*, so new indices are created each time this (impure) function is called. The counter can be reset by the optional argument *c_seed* if desired. The optional flag **reverse** is used only for octets. If set, the color and anticolor entries of the octet particle are exchanged.

(Flavors: public)+≡

```
public :: color_from_flavor
```

10.5.3 Accessing contents

Color and helicity can be done by elemental functions. Flavor needs explicit specifics because of the pointer assignment.

```
<Quantum numbers: public>+≡
    public :: quantum_numbers_get_flavor
    public :: quantum_numbers_get_color
    public :: quantum_numbers_get_helicity

<Quantum numbers: interfaces>+≡
    interface quantum_numbers_get_flavor
        module procedure quantum_numbers_get_flavor0
        module procedure quantum_numbers_get_flavor1
    end interface

<Quantum numbers: procedures>+≡
    function quantum_numbers_get_flavor0 (qn) result (flv)
        type(flavor_t) :: flv
        type(quantum_numbers_t), intent(in) :: qn
        flv = qn%f
    end function quantum_numbers_get_flavor0

    function quantum_numbers_get_flavor1 (qn) result (flv)
        type(quantum_numbers_t), dimension(:), intent(in) :: qn
        type(flavor_t), dimension(size(qn)) :: flv
        integer :: i
        do i = 1, size (qn)
            flv(i) = qn(i)%f
        end do
    end function quantum_numbers_get_flavor1

    elemental function quantum_numbers_get_color (qn) result (col)
        type(color_t) :: col
        type(quantum_numbers_t), intent(in) :: qn
        col = qn%c
    end function quantum_numbers_get_color

    elemental function quantum_numbers_get_helicity (qn) result (hel)
        type(helicity_t) :: hel
        type(quantum_numbers_t), intent(in) :: qn
        hel = qn%h
    end function quantum_numbers_get_helicity

<Quantum numbers: public>+≡
    public :: quantum_numbers_set_flavor
    public :: quantum_numbers_set_color
    public :: quantum_numbers_set_helicity

<Quantum numbers: interfaces>+≡
    interface quantum_numbers_set_flavor
        module procedure quantum_numbers_set_flavor0
        module procedure quantum_numbers_set_flavor1
    end interface
```

```

<Quantum numbers: procedures>+≡
  subroutine quantum_numbers_set_flavor0 (qn, flv)
    type(quantum_numbers_t), intent(inout) :: qn
    type(flavor_t), intent(in) :: flv
    qn%f = flv
  end subroutine quantum_numbers_set_flavor0

    type(quantum_numbers_t), dimension(:), intent(inout) :: qn
    type(flavor_t), dimension(:), intent(in) :: flv
    integer :: i
    do i = 1, size (flv)
      qn(i)%f = flv(i)
    end do
  end subroutine quantum_numbers_set_flavor1

  elemental subroutine quantum_numbers_set_color (qn, col)
    type(quantum_numbers_t), intent(inout) :: qn
    type(color_t), intent(in) :: col
    qn%c = col
  end subroutine quantum_numbers_set_color

  elemental subroutine quantum_numbers_set_helicity (qn, hel)
    type(quantum_numbers_t), intent(inout) :: qn
    type(helicity_t), intent(in) :: hel
    qn%h = hel
  end subroutine quantum_numbers_set_helicity

```

This just resets the ghost property of the color/helicity part:

```

<Quantum numbers: public>+≡
  public :: quantum_numbers_set_color_ghost
  public :: quantum_numbers_set_helicity_ghost

<Quantum numbers: procedures>+≡
  elemental subroutine quantum_numbers_set_color_ghost (qn, ghost)
    type(quantum_numbers_t), intent(inout) :: qn
    logical, intent(in) :: ghost
    call color_set_ghost (qn%c, ghost)
  end subroutine quantum_numbers_set_color_ghost

  elemental subroutine quantum_numbers_set_helicity_ghost (qn, ghost)
    type(quantum_numbers_t), intent(inout) :: qn
    logical, intent(in) :: ghost
    call helicity_set_ghost (qn%h, ghost)
  end subroutine quantum_numbers_set_helicity_ghost

```

Assign a model to the flavor part of quantum numbers.

```

<Quantum numbers: public>+≡
  public :: quantum_numbers_set_model

<Quantum numbers: interfaces>+≡
  interface quantum_numbers_set_model
    module procedure quantum_numbers_set_model_single
    module procedure quantum_numbers_set_model_array
  end interface

```

```
end interface
```

```
<Quantum numbers: procedures>+≡
  subroutine quantum_numbers_set_model_single (qn, model)
    type(quantum_numbers_t), intent(inout) :: qn
    class(model_data_t), intent(in), target :: model
    call flavor_set_model (qn%f, model)
  end subroutine quantum_numbers_set_model_single

  subroutine quantum_numbers_set_model_array (qn, model)
    type(quantum_numbers_t), dimension(:), intent(inout) :: qn
    class(model_data_t), intent(in), target :: model
    call flavor_set_model (qn%f, model)
  end subroutine quantum_numbers_set_model_array
```

This is a convenience function: return the color type for the flavor (array).

```
<Quantum numbers: public>+≡
  public :: quantum_numbers_get_color_type

<Quantum numbers: procedures>+≡
  elemental function quantum_numbers_get_color_type (qn) result (color_type)
    integer :: color_type
    type(quantum_numbers_t), intent(in) :: qn
    color_type = flavor_get_color_type (qn%f)
  end function quantum_numbers_get_color_type
```

10.5.4 Predicates

Check if the flavor index is valid (including UNDEFINED).

```
<Quantum numbers: public>+≡
  public :: quantum_numbers_are_valid

<Quantum numbers: procedures>+≡
  elemental function quantum_numbers_are_valid (qn) result (valid)
    logical :: valid
    type(quantum_numbers_t), intent(in) :: qn
    valid = flavor_is_valid (qn%f)
  end function quantum_numbers_are_valid
```

Check if the flavor part has its particle-data pointer associated (debugging aid).

```
<Quantum numbers: public>+≡
  public :: quantum_numbers_are_associated

<Quantum numbers: procedures>+≡
  elemental function quantum_numbers_are_associated (qn) result (flag)
    logical :: flag
    type(quantum_numbers_t), intent(in) :: qn
    flag = flavor_is_associated (qn%f)
  end function quantum_numbers_are_associated
```

Check if the helicity and color quantum numbers are diagonal. (Unpolarized/colorless also counts as diagonal.) Flavor is diagonal by definition.

```

<Quantum numbers: public>+≡
    public :: quantum_numbers_are_diagonal

<Quantum numbers: procedures>+≡
    elemental function quantum_numbers_are_diagonal (qn) result (diagonal)
        logical :: diagonal
        type(quantum_numbers_t), intent(in) :: qn
        diagonal = helicity_is_diagonal (qn%h) .and. color_is_diagonal (qn%c)
    end function quantum_numbers_are_diagonal

```

Check if the color and/or helicity part has the ghost property.

```

<Quantum numbers: public>+≡
    public :: quantum_numbers_is_color_ghost
    public :: quantum_numbers_is_helicity_ghost

<Quantum numbers: procedures>+≡
    elemental function quantum_numbers_is_color_ghost (qn) result (ghost)
        logical :: ghost
        type(quantum_numbers_t), intent(in) :: qn
        ghost = color_is_ghost (qn%c)
    end function quantum_numbers_is_color_ghost

    elemental function quantum_numbers_is_helicity_ghost (qn) result (ghost)

    (qn1%c /= qn2%c) .or. &
    (qn1%h /= qn2%h)
end function quantum_numbers_neq

```

Two sets of quantum numbers are compatible if the individual quantum numbers are compatible, depending on the mask. Flavor has to match, regardless of the flavor mask.

If the color flag is set, color is compatible if the ghost property is identical. If the color flag is unset, color has to be identical. I.e., if the flag is set, the color amplitudes can interfere. If it is not set, they must be identical, and there must be no ghost. The latter property is used for expanding physical color flows.

Helicity is compatible if the mask is unset, otherwise it has to match. This determines if two amplitudes can be multiplied (no mask) or traced (mask).

```

<Quantum numbers: public>+≡
    public :: quantum_numbers_are_compatible

<Quantum numbers: procedures>+≡
    elemental function quantum_numbers_are_compatible (qn1, qn2, mask) &
        result (flag)
        logical :: flag
        type(quantum_numbers_t), intent(in) :: qn1, qn2
        type(quantum_numbers_mask_t), intent(in) :: mask
        if (mask%h .or. mask%hd) then
            flag = (qn1%f .match. qn2%f) .and. (qn1%h .match. qn2%h)
        else
            flag = (qn1%f .match. qn2%f)
        end if
        if (mask%c) then
            flag = flag .and. (color_is_ghost (qn1%c) .eqv. color_is_ghost (qn2%c))
        else
            flag = flag .and. &
                .not. (color_is_ghost (qn1%c) .or. color_is_ghost (qn2%c)) .and. &
                (qn1%c == qn2%c)
        end if
    end function quantum_numbers_are_compatible

```

This is the analog for a single quantum-number set. We just check for color ghosts; they are excluded if the color mask is unset (color-flow expansion).

```

<Quantum numbers: public>+≡
    public :: quantum_numbers_are_physical

<Quantum numbers: procedures>+≡
    elemental function quantum_numbers_are_physical (qn, mask) result (flag)
        logical :: flag
        type(quantum_numbers_t), intent(in) :: qn
        type(quantum_numbers_mask_t), intent(in) :: mask
        if (mask%c) then
            flag = .true.
        else
            flag = .not. color_is_ghost (qn%c)
        end if
    end function quantum_numbers_are_physical

```

10.5.6 Operations

Inherited from the color component: reassign color indices in canonical order.

```
<Quantum numbers: public>+≡
    public :: quantum_numbers_canonicalize_color

<Quantum numbers: procedures>+≡
    subroutine quantum_numbers_canonicalize_color (qn)
        type(quantum_numbers_t), dimension(:), intent(inout) :: qn
        call color_canonicalize (qn%c)
    end subroutine quantum_numbers_canonicalize_color
```

Inherited from the color component: make a color map for two matching quantum-number arrays.

```
<Quantum numbers: public>+≡
    public :: quantum_numbers_set_color_map

<Quantum numbers: procedures>+≡
    subroutine quantum_numbers_set_color_map (map, qn1, qn2)

        qn3%h = qn1%h .merge. qn2%h
    end function merge_quantum_numbers1

```

10.5.7 The quantum number mask

The quantum numbers mask is true for quantum numbers that should be ignored or summed over. The three mandatory entries correspond to flavor, color, and helicity, respectively.

There is an additional entry `cg`: If false, the color-ghosts property should be kept even if color is ignored. This is relevant only if `c` is set, otherwise it is always false.

The flag `hd` tells that only diagonal entries in helicity should be kept. If `h` is set, `hd` is irrelevant and will be kept `.false`.

```

<Quantum numbers: public>+≡
  public :: quantum_numbers_mask_t

<Quantum numbers: types>+≡
  type :: quantum_numbers_mask_t
  private
  logical :: f = .false.
  logical :: c = .false.
  logical :: cg = .false.
  logical :: h = .false.
  logical :: hd = .false.
end type quantum_numbers_mask_t

```

Define a quantum number mask: Constructor form

```

<Quantum numbers: public>+≡
  public :: new_quantum_numbers_mask

<Quantum numbers: procedures>+≡
  elemental function new_quantum_numbers_mask &

      if (mask(i)%hd) write (u, "('d')", advance="no")
    end do
    write (u, "(A)", advance="no") "]"
  end subroutine quantum_numbers_mask_write_array
```

10.5.8 Setting mask components

```
<Quantum numbers: public>+≡
  public :: quantum_numbers_mask_set_flavor
  public :: quantum_numbers_mask_set_color
  public :: quantum_numbers_mask_set_helicity

<Quantum numbers: procedures>+≡
  elemental subroutine quantum_numbers_mask_set_flavor (mask, mask_f)
    type(quantum_numbers_mask_t), intent(inout) :: mask
```

```

        logical, intent(in) :: mask_f
        mask%f = mask_f
    end subroutine quantum_numbers_mask_set_flavor

    elemental subroutine quantum_numbers_mask_set_color (mask, mask_c, mask_cg)
        type(quantum_numbers_mask_t), intent(inout) :: mask
        logical, intent(in) :: mask_c
        logical, intent(in), optional :: mask_cg
        mask%c = mask_c
        if (present (mask_cg)) then
            if (mask%c) mask%cg = mask_cg
        else
            mask%cg = mask_c
        end if
    end subroutine quantum_numbers_mask_set_color

    elemental subroutine quantum_numbers_mask_set_helicity (mask, mask_h, mask_hd)
        type(quantum_numbers_mask_t), intent(inout) :: mask
        logical, intent(in) :: mask_h
        logical, intent(in), optional :: mask_hd
        mask%h = mask_h
        if (present (mask_hd)) then
            if (.not. mask%h) mask%hd = mask_hd
        end if
    end subroutine quantum_numbers_mask_set_helicity

```

The following routines assign part of a mask, depending on the flags given.

```

<Quantum numbers: public>+≡
    public :: quantum_numbers_mask_assign

<Quantum numbers: procedures>+≡
    elemental subroutine quantum_numbers_mask_assign &
        (mask, mask_in, flavor, color, helicity)
        type(quantum_numbers_mask_t), intent(inout) :: mask
        type(quantum_numbers_mask_t), intent(in) :: mask_in
        logical, intent(in), optional :: flavor, color, helicity
        if (present (flavor)) then
            if (flavor) then
                mask%f = mask_in%f
            end if
        end if
        if (present (color)) then
            if (color) then
                mask%c = mask_in%c
                mask%cg = mask_in%cg
            end if
        end if
        if (present (helicity)) then
            if (helicity) then
                mask%h = mask_in%h
                mask%hd = mask_in%hd
            end if
        end if
    end subroutine quantum_numbers_mask_assign

```

10.5.9 Mask predicates

Return true if either one of the entries is set:

```
<Quantum numbers: public>+≡
    public :: any

<Quantum numbers: interfaces>+≡
    interface any
        module procedure quantum_numbers_mask_any
    end interface

<Quantum numbers: procedures>+≡
    function quantum_numbers_mask_any (mask) result (match)
        logical :: match
        type(quantum_numbers_mask_t), intent(in) :: mask
        match = mask%f .or. mask%c .or. mask%h .or. mask%hd
    end function quantum_numbers_mask_any
```

10.5.10 Operators

The OR operation is applied to all components.

```
<Quantum numbers: public>+≡
    public :: operator(.or.)

<Quantum numbers: interfaces>+≡
    interface operator(.or.)
        module procedure quantum_numbers_mask_or
    end interface

<Quantum numbers: procedures>+≡
    elemental function quantum_numbers_mask_or (mask1, mask2) result (mask)
        type(quantum_numbers_mask_t) :: mask
        type(quantum_numbers_mask_t), intent(in) :: mask1, mask2
        mask%f = mask1%f .or. mask2%f
        mask%c = mask1%c .or. mask2%c
        if (mask%c) mask%cg = mask1%cg .or. mask2%cg
        mask%h = mask1%h .or. mask2%h
        if (.not. mask%h) mask%hd = mask1%hd .or. mask2%hd
    end function quantum_numbers_mask_or
```

10.5.11 Mask comparisons

Return true if the two masks are equivalent / differ:

```
<Quantum numbers: public>+≡
    public :: operator(.eqv.)
    public :: operator(.neqv.)
```

```

<Quantum numbers: interfaces>+≡
  interface operator(.eqv.)
    module procedure quantum_numbers_mask_eqv
  end interface
  interface operator(.neqv.)
    module procedure quantum_numbers_mask_neqv
  end interface

<Quantum numbers: procedures>+≡
  elemental function quantum_numbers_mask_eqv (mask1, mask2) result (eqv)
    logical :: eqv
    type(quantum_numbers_mask_t), intent(in) :: mask1, mask2
    eqv = (mask1%f .eqv. mask2%f) .and. &
          (mask1%c .eqv. mask2%c) .and. &
          (mask1%cg .eqv. mask2%cg) .and. &
          (mask1%h .eqv. mask2%h) .and. &
          (mask1%hd .eqv. mask2%hd)
  end function quantum_numbers_mask_eqv

  elemental function quantum_numbers_mask_neqv (mask1, mask2) result (neqv)
    logical :: neqv
    type(quantum_numbers_mask_t), intent(in) :: mask1, mask2
    neqv = (mask1%f .neqv. mask2%f) .or. &
          (mask1%c .neqv. mask2%c) .or. &
          (mask1%cg .neqv. mask2%cg) .or. &
          (mask1%h .neqv. mask2%h) .or. &
          (mask1%hd .neqv. mask2%hd)
  end function quantum_numbers_mask_neqv

```

10.5.12 Apply a mask

Applying a mask to the quantum number object means undefining those entries where the mask is set. The others remain unaffected.

The `hd` mask has the special property that it “diagonalizes” helicity, i.e., the second helicity entry is dropped and the result is a diagonal helicity quantum number.

```

<Quantum numbers: public>+≡
  public :: quantum_numbers_undefine
  public :: quantum_numbers_undefined

<Quantum numbers: interfaces>+≡
  interface quantum_numbers_undefined
    module procedure quantum_numbers_undefined0
    module procedure quantum_numbers_undefined1
    module procedure quantum_numbers_undefined11
  end interface

<Quantum numbers: procedures>+≡
  elemental subroutine quantum_numbers_undefine (qn, mask)
    type(quantum_numbers_t), intent(inout) :: qn
    type(quantum_numbers_mask_t), intent(in) :: mask
    if (mask%f) call flavor_undefine (qn%f)
    if (mask%c) call color_undefine (qn%c, undefine_ghost=mask%cg)

```

```

    if (mask%h) then
        call helicity_undefine (qn%h)
    else if (mask%hd) then
        if (.not. helicity_is_diagonal (qn%h)) then
            call helicity_diagonalize (qn%h)
        end if
    end if
end if
end subroutine quantum_numbers_undefine

function quantum_numbers_undefined0 (qn, mask) result (qn_new)
    type(quantum_numbers_t), intent(in) :: qn
    type(quantum_numbers_mask_t), intent(in) :: mask
    type(quantum_numbers_t) :: qn_new
    qn_new = qn
    call quantum_numbers_undefine (qn_new, mask)
end function quantum_numbers_undefined0

function quantum_numbers_undefined1 (qn, mask) result (qn_new)
    type(quantum_numbers_t), dimension(:), intent(in) :: qn
    type(quantum_numbers_mask_t), intent(in) :: mask
    type(quantum_numbers_t), dimension(size(qn)) :: qn_new
    qn_new = qn
    call quantum_numbers_undefine (qn_new, mask)
end function quantum_numbers_undefined1

function quantum_numbers_undefined11 (qn, mask) result (qn_new)
    type(quantum_numbers_t), dimension(:), intent(in) :: qn
    type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
    type(quantum_numbers_t), dimension(size(qn)) :: qn_new
    qn_new = qn
    call quantum_numbers_undefine (qn_new, mask)
end function quantum_numbers_undefined11

```

Return true if the input quantum number set has entries that would be removed by the applied mask, e.g., if polarization is defined but `mask%h` is set:

```

<Quantum numbers: public>+≡
    public :: quantum_numbers_are_redundant

<Quantum numbers: procedures>+≡
    elemental function quantum_numbers_are_redundant (qn, mask) &
        result (redundant)
        logical :: redundant
        type(quantum_numbers_t), intent(in) :: qn
        type(quantum_numbers_mask_t), intent(in) :: mask
        redundant = .false.
        if (mask%f) then
            redundant = flavor_is_defined (qn%f)
        end if
        if (mask%c) then
            redundant = color_is_defined (qn%c)
        end if
        if (mask%h) then
            redundant = helicity_is_defined (qn%h)
        else if (mask%hd) then

```

```

        redundant = .not. helicity_is_diagonal (qn%h)
    end if
end function quantum_numbers_are_redundant

```

Return true if the helicity flag is set or the diagonal-helicity flag is set.

```

<Quantum numbers: public>+≡
    public :: quantum_numbers_mask_diagonal_helicity

<Quantum numbers: procedures>+≡
    elemental function quantum_numbers_mask_diagonal_helicity (mask) &
        result (flag)
        logical :: flag
        type(quantum_numbers_mask_t), intent(in) :: mask
        flag = mask%h .or. mask%hd
    end function quantum_numbers_mask_diagonal_helicity

```

Chapter 11

Transition Matrices and Evaluation

The modules in this chapter implement transition matrices and calculations. The functionality is broken down in three modules

state_matrices represent state and transition density matrices built from particle quantum numbers (helicity, color, flavor)

interactions extend state matrices with the record of particle momenta. They also distinguish in- and out-particles and store parent-child relations.

evaluators These objects extend interaction objects by the information how to calculate matrix elements from products and squares of other interactions. They implement the methods to actually compute those matrix elements.

11.1 State matrices

This module deals with the internal state of a particle system, i.e., with its density matrix in flavor, color, and helicity space.

```
<state_matrices.f90>≡  
<File header>  
  
module state_matrices  
  
  <Use kinds>  
  use io_units  
  use format_utils, only: pac_fmt  
  use format_defs, only: FMT_17, FMT_19  
  use unit_tests  
  use diagnostics  
  use flavors  
  use colors  
  use helicities  
  use quantum_numbers  
  
  <Standard module head>  
  
  <State matrices: public>  
  
  <State matrices: parameters>  
  
  <State matrices: types>  
  
  <State matrices: interfaces>  
  
  contains  
  
  <State matrices: procedures>  
  
  <State matrices: tests>  
  
end module state_matrices
```

11.1.1 Nodes of the quantum state trie

A quantum state object represents an unnormalized density matrix, i.e., an array of possibilities for flavor, color, and helicity indices with associated complex values. Physically, the trace of this matrix is the summed squared matrix element for an interaction, and the matrix elements divided by this value correspond to the flavor-color-helicity density matrix. (Flavor and color are diagonal.)

We store density matrices as tries, that is, as trees where each branching represents the possible quantum numbers of a particle. The first branching is the first particle in the system. A leaf (the node corresponding to the last particle) contains the value of the matrix element.

Each node contains a flavor, color, and helicity entry. Note that each of those entries may be actually undefined, so we can also represent, e.g., unpolarized particles.

The value is meaningful only for leaves, which have no child nodes. There is a pointer to the parent node which allows for following the trie downwards from a leaf, it is null for a root node. The child nodes are implemented as a list, so there is a pointer to the first and last child, and each node also has a **next** pointer to the next sibling.

The root node does not correspond to a particle, only its children do. The quantum numbers of the root node are irrelevant and will not be set. However, we use a common type for the three classes (root, branch, leaf); they may easily be distinguished by the association status of parent and child.

Node type

The node is linked in all directions: the parent, the first and last in the list of children, and the previous and next sibling. This allows us for adding and removing nodes and whole branches anywhere in the trie. (Circular links are not allowed, however.). The node holds its associated set of quantum numbers. The integer index, which is set only for leaf nodes, is the index of the corresponding matrix element value within the state matrix.

Temporarily, matrix-element values may be stored within a leaf node. This is used during state-matrix factorization. When the state matrix is **frozen**, these values are transferred to the matrix-element array within the host state matrix.

```

<State matrices: types>≡
  type :: node_t
  private
  type(quantum_numbers_t) :: qn
  type(node_t), pointer :: parent => null ()
  type(node_t), pointer :: child_first => null ()
  type(node_t), pointer :: child_last => null ()
  type(node_t), pointer :: next => null ()
  type(node_t), pointer :: previous => null ()
  integer :: me_index = 0
  integer, dimension(:), allocatable :: me_count
  complex(default) :: me = 0
end type node_t

```

Operations on nodes

Recursively deallocate all children of the current node. This includes any values associated with the children.

```

<State matrices: procedures>≡
  pure recursive subroutine node_delete_offspring (node)
  type(node_t), pointer :: node
  type(node_t), pointer :: child
  child => node%child_first
  do while (associated (child))
    node%child_first => node%child_first%next
    call node_delete_offspring (child)
    deallocate (child)
    child => node%child_first
  end do

```

```

        node%child_last => null ()
    end subroutine node_delete_offspring

```

Remove a node including its offspring. Adjust the pointers of parent and siblings, if necessary.

(State matrices: procedures)+≡

```

    pure subroutine node_delete (node)
        type(node_t), pointer :: node
        call node_delete_offspring (node)
        if (associated (node%previous)) then
            node%previous%next => node%next
        else if (associated (node%parent)) then
            node%parent%child_first => node%next
        end if
        if (associated (node%next)) then
            node%next%previous => node%previous
        else if (associated (node%parent)) then
            node%parent%child_last => node%previous

```

```

        end if
    end subroutine node_read_raw_rec

```

11.1.2 State matrix

Definition

The quantum state object is a container that keeps and hides the root node. For direct accessibility of values, they are stored in a separate array. The leaf nodes of the quantum-number tree point to those values, once the state matrix is finalized.

The `norm` component is redefined if a common factor is extracted from all nodes.

```

<State matrices: public>≡
    public :: state_matrix_t

<State matrices: types>+≡
    type :: state_matrix_t
    private
        type(node_t), pointer :: root => null ()
        integer :: depth = 0
        integer :: n_matrix_elements = 0
        logical :: leaf_nodes_store_values = .false.
        integer :: n_counters = 0
        complex(default), dimension(:), allocatable :: me
        real(default) :: norm = 1
    end type state_matrix_t

```

This initializer allocates the root node but does not fill anything. We declare whether values are stored within the nodes during state-matrix construction, and how many counters should be maintained (default: none).

```

<State matrices: public>+≡
    public :: state_matrix_init

<State matrices: procedures>+≡
    elemental subroutine state_matrix_init (state, store_values, n_counters)
        type(state_matrix_t), intent(out) :: state
        logical, intent(in), optional :: store_values
        integer, intent(in), optional :: n_counters
        allocate (state%root)
        if (present (store_values)) &
            state%leaf_nodes_store_values = store_values
        if (present (n_counters)) state%n_counters = n_counters
    end subroutine state_matrix_init

```

This recursively deletes all children of the root node, restoring the initial state. The matrix element array is not finalized, since it does not contain physical entries, just pointers.

```

<State matrices: public>+≡
    public :: state_matrix_final

```

```

<State matrices: procedures>+≡
  elemental subroutine state_matrix_final (state)
    type(state_matrix_t), intent(inout) :: state
    if (allocated (state%me)) deallocate (state%me)
    if (associated (state%root)) call node_delete (state%root)
    state%depth = 0
    state%n_matrix_elements = 0
  end subroutine state_matrix_final

```

Output: Present the tree as a nested list with appropriate indentation.

```

<State matrices: public>+≡
  public :: state_matrix_write

<State matrices: procedures>+≡
  subroutine state_matrix_write (state, unit, write_value_list, &
    verbose, testflag)

      call node_read_raw_rec (state%root, u, iostat=iostat)
      call state_matrix_freeze (state)
    end if
  end subroutine state_matrix_read_raw

```

Properties of the quantum state

A state is defined if its root is allocated:

```

<State matrices: public>+≡
  public :: state_matrix_is_defined

<State matrices: procedures>+≡
  elemental function state_matrix_is_defined (state) result (defined)
    logical :: defined
    type(state_matrix_t), intent(in) :: state
    defined = associated (state%root)
  end function state_matrix_is_defined

```

A state is empty if its depth is zero:

```

<State matrices: public>+≡
  public :: state_matrix_is_empty

```

```

<State matrices: procedures>+≡
  elemental function state_matrix_is_empty (state) result (flag)
    logical :: flag
    type(state_matrix_t), intent(in) :: state
    flag = state%depth == 0
  end function state_matrix_is_empty

```

Return the number of matrix-element values.

```

<State matrices: public>+≡
  public :: state_matrix_get_n_matrix_elements

<State matrices: procedures>+≡
  function state_matrix_get_n_matrix_elements (state) result (n)
    integer :: n
    type(state_matrix_t), intent(in) :: state
    n = state%n_matrix_elements
  end function state_matrix_get_n_matrix_elements

```

Return the number of leaves. This can be larger than the number of independent matrix elements.

```

<State matrices: public>+≡
  public :: state_matrix_get_n_leaves

<State matrices: procedures>+≡
  function state_matrix_get_n_leaves (state) result (n)
    integer :: n
    type(state_matrix_t), intent(in) :: state
    type(state_iterator_t) :: it
    n = 0
    call state_iterator_init (it, state)
    do while (state_iterator_is_valid (it))
      n = n + 1
      call state_iterator_advance (it)
    end do
  end function state_matrix_get_n_leaves

```

Return the depth:

```

<State matrices: public>+≡
  public :: state_matrix_get_depth

<State matrices: procedures>+≡
  function state_matrix_get_depth (state) result (depth)
    integer :: depth
    type(state_matrix_t), intent(in) :: state
    depth = state%depth
  end function state_matrix_get_depth

```

Return the norm:

```

<State matrices: public>+≡
  public :: state_matrix_get_norm

```

```

<State matrices: procedures>+≡
function state_matrix_get_norm (state) result (norm)
  real(default) :: norm
  type(state_matrix_t), intent(in) :: state
  norm = state%norm
end function state_matrix_get_norm

```

Retrieving contents

Return the quantum number array, using an index. We have to scan the state matrix since there is no shortcut.

```

<State matrices: public>+≡
public :: state_matrix_get_quantum_numbers

<State matrices: procedures>+≡
function state_matrix_get_quantum_numbers (state, i) result (qn)
  type(state_matrix_t), intent(in), target :: state
  integer, intent(in) :: i
  type(quantum_numbers_t), dimension(state%depth) :: qn
  type(state_iterator_t) :: it
  integer :: k
  k = 0
  call state_iterator_init (it, state)
  do while (state_iterator_is_valid (it))
    k = k + 1
    if (k == i) then
      qn = state_iterator_get_quantum_numbers (it)
      return
    end if
    call state_iterator_advance (it)
  end do
end function state_matrix_get_quantum_numbers

```

Return a single matrix element using its index. Works only if the shortcut array is allocated.

```

<State matrices: public>+≡
public :: state_matrix_get_matrix_element

<State matrices: procedures>+≡
function state_matrix_get_matrix_element (state, i) result (me)
  complex(default) :: me
  type(state_matrix_t), intent(in) :: state
  integer, intent(in) :: i
  if (allocated (state%me)) then
    me = state%me(i)
  else
    me = 0
  end if
end function state_matrix_get_matrix_element

```

Return the color index with maximum absolute value that is present within the state matrix.

```

<State matrices: public>+≡
    public :: state_matrix_get_max_color_value

<State matrices: procedures>+≡
    function state_matrix_get_max_color_value (state) result (cmax)
        integer :: cmax
        type(state_matrix_t), intent(in) :: state
        if (associated (state%root)) then
            cmax = node_get_max_color_value (state%root)
        else
            cmax = 0
        end if
    contains
        recursive function node_get_max_color_value (node) result (cmax)
            integer :: cmax
            type(node_t), intent(in), target :: node
            type(node_t), pointer :: current
            cmax = quantum_numbers_get_max_color_value (node%qn)
            current => node%child_first
            do while (associated (current))
                cmax = max (cmax, node_get_max_color_value (current))
                current => current%next
            end do
        end function node_get_max_color_value
    end function state_matrix_get_max_color_value

```

Building the quantum state

The procedure generates a branch associated to the input array of quantum numbers. If the branch exists already, it is used.

Optionally, we set the matrix-element index, a value (which may be added to the previous one), and increment one of the possible counters. We may also return the matrix element index of the current node.

```

<State matrices: public>+≡
    public :: state_matrix_add_state

<State matrices: procedures>+≡
    subroutine state_matrix_add_state &
        (state, qn, index, value, sum_values, counter_index, me_index)
        type(state_matrix_t), intent(inout) :: state
        type(quantum_numbers_t), dimension(:), intent(in) :: qn
        integer, intent(in), optional :: index
        complex(default), intent(in), optional :: value
        logical, intent(in), optional :: sum_values
        integer, intent(in), optional :: counter_index
        integer, intent(out), optional :: me_index
        logical :: set_index, get_index, add
        set_index = present (index)
        get_index = present (me_index)

                end if
            end if
        case (2:)
            call node_make_branch (child, qn(2:))
        end select
    end subroutine node_make_branch
end subroutine state_matrix_add_state

```

Remove irrelevant flavor/color/helicity labels and the corresponding branchings. The masks indicate which particles are affected; the masks length should coincide with the depth of the trie (without the root node). Recursively scan the whole tree, starting from the leaf nodes and working up to the root node. If a mask entry is set for the current tree level, scan the children there. For each child within that level make a new empty branch where the masked quantum number is undefined. Then recursively combine all following children with matching quantum number into this new node and move on.

```

<State matrices: public>+≡
    public :: state_matrix_collapse

<State matrices: procedures>+≡
    subroutine state_matrix_collapse (state, mask)
        type(state_matrix_t), intent(inout) :: state
        type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
        type(state_matrix_t) :: red_state
        if (state_matrix_is_defined (state)) then
            call state_matrix_reduce (state, mask, red_state)
            call state_matrix_final (state)
            state = red_state
        end if
    end subroutine state_matrix_collapse

```

Transform the given state matrix into a reduced state matrix where some quantum numbers are removed, as indicated by the mask. The procedure creates a new state matrix, so the old one can be deleted after this if it is no longer used.

```

<State matrices: public>+≡
    public :: state_matrix_reduce

<State matrices: procedures>+≡
    subroutine state_matrix_reduce (state, mask, red_state)

        call state_iterator_init (it, state)
        do while (state_iterator_is_valid (it))
            qn = state_iterator_get_quantum_numbers (it)
            call quantum_numbers_undefine (qn, mask)
            call state_matrix_add_state (red_state, qn)
            call state_iterator_advance (it)
        end do
    end subroutine state_matrix_reduce

```

This subroutine sets up the matrix-element array. The leaf nodes acquire the index values that point to the appropriate matrix-element entry.

We recursively scan the trie. Once we arrive at a leaf node, the index is increased and associated to that node. Finally, we allocate the matrix-element array with the appropriate size.

If matrix element values are temporarily stored within the leaf nodes, we scan the state again and transfer them to the matrix-element array.

```

<State matrices: public>+≡
    public :: state_matrix_freeze

<State matrices: interfaces>≡
    interface state_matrix_freeze
        module procedure state_matrix_freeze1
        module procedure state_matrix_freeze2
    end interface

<State matrices: procedures>+≡
    subroutine state_matrix_freeze1 (state)
        type(state_matrix_t), intent(inout), target :: state
        type(state_iterator_t) :: it
        if (associated (state%root)) then
            if (allocated (state%me)) deallocate (state%me)
            allocate (state%me (state%n_matrix_elements))
            state%me = 0
        end if
        if (state%leaf_nodes_store_values) then
            call state_iterator_init (it, state)
            do while (state_iterator_is_valid (it))
                state%me(state_iterator_get_me_index (it)) &
                    = state_iterator_get_matrix_element (it)
                call state_iterator_advance (it)
            end do
            state%leaf_nodes_store_values = .false.
        end if
    end subroutine state_matrix_freeze1

    subroutine state_matrix_freeze2 (state)
        type(state_matrix_t), dimension(:), intent(inout), target :: state
        integer :: i
        do i = 1, size (state)
            call state_matrix_freeze1 (state(i))
        end do
    end subroutine state_matrix_freeze2

```

Direct access to the value array

Several methods for setting a value directly are summarized in this generic:

```

<State matrices: public>+≡
    public :: state_matrix_set_matrix_element

<State matrices: interfaces>+≡
    interface state_matrix_set_matrix_element
        module procedure state_matrix_set_matrix_element_qn
        module procedure state_matrix_set_matrix_element_all
        module procedure state_matrix_set_matrix_element_array
        module procedure state_matrix_set_matrix_element_single
        module procedure state_matrix_set_matrix_element_clone
    end interface

```

Set a value that corresponds to a quantum number array:

```

<State matrices: procedures>+≡
subroutine state_matrix_set_matrix_element_qn (state, qn, value)
  type(state_matrix_t), intent(inout) :: state
  type(quantum_numbers_t), dimension(:), intent(in) :: qn
  complex(default), intent(in) :: value
  type(state_iterator_t) :: it
  if (.not. allocated (it%state%me)) then
    allocate (it%state%me (size(qn)))
  end if
  call state_iterator_init (it, state)
  do while (state_iterator_is_valid (it))
    if (all (qn == state_iterator_get_quantum_numbers (it))) then
      call state_iterator_set_matrix_element (it, value)
      return
    end if
    call state_iterator_advance (it)
  end do
end subroutine state_matrix_set_matrix_element_qn

```

Set all matrix elements to a single value

```

<State matrices: procedures>+≡
subroutine state_matrix_set_matrix_element_all (state, value)
  type(state_matrix_t), intent(inout) :: state
  complex(default), intent(in) :: value
  if (.not. allocated (state%me)) then
    allocate (state%me (state%n_matrix_elements))
  end if
  state%me = value
end subroutine state_matrix_set_matrix_element_all

```

Set the matrix-element array directly.

```

<State matrices: procedures>+≡
subroutine state_matrix_set_matrix_element_array (state, value)
  type(state_matrix_t), intent(inout) :: state
  complex(default), dimension(:), intent(in) :: value
  if (.not. allocated (state%me)) then
    allocate (state%me (size (value)))
  end if
  state%me = value
end subroutine state_matrix_set_matrix_element_array

pure subroutine state_matrix_set_matrix_element_single (state, i, value)
  type(state_matrix_t), intent(inout) :: state
  integer, intent(in) :: i
  complex(default), intent(in) :: value
  if (.not. allocated (state%me)) then
    allocate (state%me (state%n_matrix_elements))
  end if
  state%me(i) = value
end subroutine state_matrix_set_matrix_element_single

```

Clone the matrix elements from another (matching) state matrix.

```

<State matrices: procedures>+≡
  subroutine state_matrix_set_matrix_element_clone (state, state1)
    type(state_matrix_t), intent(inout) :: state
    type(state_matrix_t), intent(in) :: state1
    if (.not. allocated (state1%me)) return
    if (.not. allocated (state%me)) allocate (state%me (size (state1%me)))
    state%me = state1%me
  end subroutine state_matrix_set_matrix_element_clone

```

Add a value to a matrix element

```

<State matrices: public>+≡
  public :: state_matrix_add_to_matrix_element

<State matrices: procedures>+≡
  subroutine state_matrix_add_to_matrix_element (state, i, value)
    type(state_matrix_t), intent(inout) :: state
    integer, intent(in) :: i
    complex(default), intent(in) :: value
    state%me(i) = state%me(i) + value
  end subroutine state_matrix_add_to_matrix_element

```

11.1.3 State iterators

Accessing the quantum state from outside is best done using a specialized iterator, i.e., a pointer to a particular branch of the quantum state trie. Technically, the iterator contains a pointer to a leaf node, but via parent pointers it allows to access the whole branch where the leaf is attached. For quick access, we also keep the branch depth (which is assumed to be universal for a quantum state).

```

<State matrices: public>+≡
  public :: state_iterator_t

<State matrices: types>+≡
  type :: state_iterator_t
    private
    integer :: depth = 0
    type(state_matrix_t), pointer :: state => null ()
    type(node_t), pointer :: node => null ()
  end type state_iterator_t

```

The initializer: Point at the first branch. Note that this cannot be pure, thus not be elemental, because the iterator can be used to manipulate data in the state matrix.

```

<State matrices: public>+≡
  public :: state_iterator_init

<State matrices: procedures>+≡
  subroutine state_iterator_init (it, state)
    type(state_iterator_t), intent(out) :: it
    type(state_matrix_t), intent(in), target :: state
    it%state => state
    it%depth = state%depth
  end subroutine state_iterator_init

```

```

if (state_matrix_is_defined (state)) then
  it%node => state%root
  do while (associated (it%node%child_first))
    it%node => it%node%child_first
  end do
else
  it%node => null ()
end if
end subroutine state_iterator_init

```

Go forward. Recursively programmed: if the next node does not exist, go back to the parent node and look at its successor (if present), etc.

There is a possible pitfall in the implementation: If the dummy pointer argument to the `find_next` routine is used directly, we still get the correct result for the iterator, but calling the recursion on `node%parent` means that we manipulate a parent pointer in the original state in addition to the iterator. Making a local copy of the pointer avoids this. Using pointer intent would be helpful, but we do not yet rely on this F2003 feature.

```

<State matrices: public>+≡
  public :: state_iterator_advance

<State matrices: procedures>+≡
  subroutine state_iterator_advance (it)
    type(state_iterator_t), intent(inout) :: it
    call find_next (it%node)
  contains
    recursive subroutine find_next (node_in)
      type(node_t), intent(in), target :: node_in
      type(node_t), pointer :: node
      node => node_in
      if (associated (node%next)) then
        node => node%next
        do while (associated (node%child_first))
          node => node%child_first
        end do
        it%node => node
      else if (associated (node%parent)) then
        call find_next (node%parent)
      else
        it%node => null ()
      end if
    end subroutine find_next
  end subroutine state_iterator_advance

```

If all has been scanned, the iterator is at an undefined state. Check for this:

```

<State matrices: public>+≡
  public :: state_iterator_is_valid

<State matrices: procedures>+≡
  function state_iterator_is_valid (it) result (defined)
    logical :: defined
    type(state_iterator_t), intent(in) :: it
    defined = associated (it%node)
  end function

```

```
end function state_iterator_is_valid
```

Return the matrix-element index that corresponds to the current node

```
<State matrices: public>+≡
public :: state_iterator_get_me_index

<State matrices: procedures>+≡
function state_iterator_get_me_index (it) result (n)
    integer :: n
    type(state_iterator_t), intent(in) :: it
    n = it%node%me_index
end function state_iterator_get_me_index
```

Return the number of times this quantum-number state has been added (noting that it is physically inserted only the first time). Note that for each state, there is an array of counters.

```
<State matrices: public>+≡
public :: state_iterator_get_me_count

<State matrices: procedures>+≡
function state_iterator_get_me_count (it) result (n)
    integer, dimension(:), allocatable :: n
    type(state_iterator_t), intent(in) :: it
    if (allocated (it%node%me_count)) then
        allocate (n (size (it%node%me_count)))
        n = it%node%me_count
    else
        allocate (n (0))
    end if
end function state_iterator_get_me_count
```

Use the iterator to retrieve quantum-number information:

```
<State matrices: public>+≡
public :: state_iterator_get_quantum_numbers
public :: state_iterator_get_flavor
public :: state_iterator_get_color
public :: state_iterator_get_helicity

<State matrices: interfaces>+≡
interface state_iterator_get_quantum_numbers
    module procedure state_iterator_get_qn_multi
    module procedure state_iterator_get_qn_slice
    module procedure state_iterator_get_qn_range
    module procedure state_iterator_get_qn_single
end interface

interface state_iterator_get_flavor
    module procedure state_iterator_get_flv_multi
    module procedure state_iterator_get_flv_slice
    module procedure state_iterator_get_flv_range
    module procedure state_iterator_get_flv_single
end interface
```

```

interface state_iterator_get_color
  module procedure state_iterator_get_col_multi
  module procedure state_iterator_get_col_slice
  module procedure state_iterator_get_col_range
  module procedure state_iterator_get_col_single
end interface

interface state_iterator_get_helicity
  module procedure state_iterator_get_hel_multi
  module procedure state_iterator_get_hel_slice
  module procedure state_iterator_get_hel_range
  module procedure state_iterator_get_hel_single
end interface

```

These versions return the whole quantum number array

(State matrices: procedures)+≡

```

function state_iterator_get_qn_multi (it) result (qn)
  type(state_iterator_t), intent(in) :: it
  type(quantum_numbers_t), dimension(it%depth) :: qn
  type(node_t), pointer :: node

      n = n + 1
      tmp(n) = state_iterator_get_me_index (it)
    end if
    call state_iterator_advance (it)
  end do
  allocate (i(n))
  if (n > 0) i = tmp(:n)
end subroutine state_matrix_get_diagonal_entries

```

Normalize all matrix elements, i.e., multiply by a common factor. Assuming that the factor is nonzero, of course.

```

<State matrices: public>+≡
public :: state_matrix_renormalize

<State matrices: procedures>+≡
subroutine state_matrix_renormalize (state, factor)
  type(state_matrix_t), intent(inout) :: state
  complex(default), intent(in) :: factor

```

```

state%me = state%me * factor
end subroutine state_matrix_renormalize

```

Renormalize the state matrix by its trace, if nonzero. The renormalization is reflected in the state-matrix norm.

```

<State matrices: public>+≡
public :: state_matrix_normalize_by_trace

<State matrices: procedures>+≡
subroutine state_matrix_normalize_by_trace (state)
  type(state_matrix_t), intent(inout) :: state
  real(default) :: trace
  trace = state_matrix_trace (state)
  if (trace /= 0) then
    state%me = state%me / trace
    state%norm = state%norm * trace
  end if
end subroutine state_matrix_normalize_by_trace

```

Analogous, but renormalize by maximal (absolute) value.

```

<State matrices: public>+≡
public :: state_matrix_normalize_by_max

<State matrices: procedures>+≡
subroutine state_matrix_normalize_by_max (state)
  type(state_matrix_t), intent(inout) :: state
  real(default) :: m
  m = maxval (abs (state%me))
  if (m /= 0) then
    state%me = state%me / m
    state%norm = state%norm * m
  end if
end subroutine state_matrix_normalize_by_max

```

Explicitly set the norm of a state matrix.

```

<State matrices: public>+≡
public :: state_matrix_set_norm

<State matrices: procedures>+≡
subroutine state_matrix_set_norm (state, norm)
  type(state_matrix_t), intent(inout) :: state
  real(default), intent(in) :: norm
  state%norm = norm
end subroutine state_matrix_set_norm

```

Return the sum of all matrix element values.

```

<State matrices: public>+≡
public :: state_matrix_sum

<State matrices: procedures>+≡
function state_matrix_sum (state) result (value)
  complex(default) :: value
  type(state_matrix_t), intent(in) :: state

```

```

        value = sum (state%me)
    end function state_matrix_sum

```

Return the trace of a state matrix, i.e., the sum over all diagonal values. If `qn_in` is provided, only branches that match this quantum-numbers array are considered.

```

<State matrices: public>+≡
    public :: state_matrix_trace

<State matrices: procedures>+≡
    function state_matrix_trace (state, qn_in) result (trace)
        complex(default) :: trace
        type(state_matrix_t), intent(in), target :: state
        type(quantum_numbers_t), dimension(:), intent(in), optional :: qn_in
        type(quantum_numbers_t), dimension(:), allocatable :: qn

```

This procedure merges two state matrices of equal depth. For each quantum number (flavor, color, helicity), we take the entry from the first argument where defined, otherwise the second one. (If both are defined, we get an off-diagonal matrix.) The resulting trie combines the information of the input tries in all possible ways. Note that values are ignored, all values in the result are zero.

Multiply matrix elements from two state matrices. Choose the elements as given by the integer index arrays, multiply them and store the sum of products

in the indicated matrix element. The suffixes mean: c=conjugate first factor; f=include weighting factor.

Note that the `dot_product` intrinsic function conjugates its first complex argument. This is intended for the c suffix case, but must be reverted for the plain-product case.

We provide analogous subroutines for just summing over state matrix entries. The `evaluate_sum` variant includes the state-matrix norm in the evaluation, the `evaluate_me_sum` takes into account just the matrix elements proper.

```

11.1.5 Factorization

In physical events, the state matrix is factorized into single-particle state matrices. This is essentially a measurement.

In a simulation, we select one particular branch of the state matrix with a probability that is determined by the matrix elements at the leaves. (This makes sense only if the state matrix represents a squared amplitude.) The selection is based on a (random) value x between 0 and one that is provided as the third argument.

For flavor and color, we select a unique value for each particle. For polarization, we have three options (modes). Option 1 is to drop helicity information altogether and sum over all diagonal helicities. Option 2 is to select a unique diagonal helicity in the same way as flavor and color. Option 3 is, for each particle, to trace over all remaining helicities in order to obtain an array of independent single-particle helicity matrices.

Only branches that match the given quantum-number array `qn_in`, if present, are considered. For this array, color is ignored.

If the optional `correlated_state` is provided, it is assigned the correlated density matrix for the selected flavor-color branch, so multi-particle spin correlations remain available even if they are dropped in the single-particle density matrices.

The algorithm is as follows: First, we determine the normalization by summing over all diagonal matrix elements. In a second scan, we select one of the diagonal matrix elements by a cumulative comparison with the normalized random number. In the corresponding quantum number array, we undefine the

helicity entries. Then, we scan the third time. For each branch that matches the selected quantum number array (i.e., definite flavor and color, arbitrary helicity), we determine its contribution to any of the single-particle state matrices. The matrix-element value is added if all other quantum numbers are diagonal, while the helicity of the chosen particle may be arbitrary; this helicity determines the branch in the single-particle state.

As a result, flavor and color quantum numbers are selected with the correct probability. Within this subset of states, each single-particle state matrix results from tracing over all other particles. Note that the single-particle state matrices are not normalized.

The flag `ok` is set to false if the matrix element sum is zero, so factorization is not possible. This can happen if an event did not pass cuts.

11.2 Interactions

This module defines the `interaction_t` type. It is an extension of the `state_matrix_t` type.

The state matrix is a representation of a multi-particle density matrix. It implements all possible flavor, color, and quantum-number assignments of the entries in a generic density matrix, and it can hold a complex matrix element for each entry. (Note that this matrix can hold non-diagonal entries in color and helicity space.) The `interaction_t` object associates this with a list of momenta, such that the whole object represents a multi-particle state.

The `interaction_t` holds information about which particles are incoming, virtual (i.e., kept for the records), or outgoing. Each particle can be associated to a source within another interaction. This allows us to automatically fill those interaction momenta which have been computed or defined elsewhere. It also contains internal parent-child relations and flags for (virtual) particles which are to be treated as resonances.

A quantum-number mask array summarizes, for each particle within the interaction, the treatment of flavor, color, or helicity (expose or ignore). A list of locks states which particles are bound to have an identical quantum-number mask. This is useful when the mask is changed at one place.

```

```

11.2.1 External interaction links

Each particle in an interaction can have a link to a corresponding particle in another interaction. This allows to fetch the momenta of incoming or virtual particles from the interaction where they are defined. The link object consists of a pointer to the interaction and an index.

```

<Interactions: types>≡
    type :: external_link_t
    private
        type(interaction_t), pointer :: int => null ()
        integer :: i
    end type external_link_t

```

Set an external link.

```

<Interactions: procedures>≡
    subroutine external_link_set (link, int, i)
        type(external_link_t), intent(out) :: link
        type(interaction_t), target, intent(in) :: int
        integer, intent(in) :: i
        if (i /= 0) then
            link%int => int
            link%i = i
        end if
    end subroutine external_link_set

```

Reassign an external link to a new interaction (which should be an image of the original target).

```

<Interactions: procedures>+≡
    subroutine external_link_reassign (link, int_src, int_target)
        type(external_link_t), intent(inout) :: link
        type(interaction_t), intent(in) :: int_src
        type(interaction_t), intent(in), target :: int_target
        if (associated (link%int)) then

```

```

        if (link%int%tag == int_src%tag) link%int => int_target
    end if
end subroutine external_link_reassign

```

Return true if the link is set

```

<Interactions: procedures>+≡
function external_link_is_set (link) result (flag)
    logical :: flag
    type(external_link_t), intent(in) :: link
    flag = associated (link%int)
end function external_link_is_set

```

Return the interaction pointer.

```

<Interactions: public>≡
public :: external_link_get_ptr

<Interactions: procedures>+≡
function external_link_get_ptr (link) result (int)
    type(interaction_t), pointer :: int
    type(external_link_t), intent(in) :: link
    int => link%int
end function external_link_get_ptr

```

Return the index within that interaction

```

<Interactions: public>+≡
public :: external_link_get_index

<Interactions: procedures>+≡
function external_link_get_index (link) result (i)
    integer :: i
    type(external_link_t), intent(in) :: link
    i = link%i
end function external_link_get_index

```

Return a pointer to the momentum of the corresponding particle. If there is no association, return a null pointer.

```

<Interactions: procedures>+≡
function external_link_get_momentum_ptr (link) result (p)
    type(vector4_t), pointer :: p
    type(external_link_t), intent(in) :: link
    if (associated (link%int)) then
        p => link%int%p(link%i)
    else
        p => null ()
    end if
end function external_link_get_momentum_ptr

```

11.2.2 Internal relations

In addition to the external links, particles within the interaction have parent-child relations. Here, more than one link is possible, and we set up an array.

```

<Interactions: types>+≡

```

```

type :: internal_link_list_t
  private
  integer :: length = 0
  integer, dimension(:), allocatable :: link
contains
  <Interactions: internal link list: TBP>
end type internal_link_list_t

```

Output, non-advancing.

```

<Interactions: internal link list: TBP>≡
  procedure :: write => internal_link_list_write

<Interactions: procedures>+≡
  subroutine internal_link_list_write (object, unit)
    class(internal_link_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit)
    do i = 1, object%length
      write (u, "(1x,I0)", advance="no") object%link(i)
    end do
  end subroutine internal_link_list_write

```

Append an item. Start with an array size of 2 and double the size if necessary.

```

<Interactions: internal link list: TBP>+≡
  procedure :: append => internal_link_list_append

<Interactions: procedures>+≡
  subroutine internal_link_list_append (link_list, link)
    class(internal_link_list_t), intent(inout) :: link_list
    integer, intent(in) :: link
    integer :: l
    integer, dimension(:), allocatable :: tmp
    l = link_list%length
    if (allocated (link_list%link)) then
      if (l == size (link_list%link)) then
        allocate (tmp (2 * l))
        tmp(:l) = link_list%link
        call move_alloc (from = tmp, to = link_list%link)
      end if
    else
      allocate (link_list%link (2))
    end if
    l = l + 1
    link_list%link(l) = link
    link_list%length = l
  end subroutine internal_link_list_append

```

Return true if the link list is nonempty:

```

<Interactions: internal link list: TBP>+≡
  procedure :: has_entries => internal_link_list_has_entries

```

```

<Interactions: procedures>+≡
function internal_link_list_has_entries (link_list) result (flag)
  class(internal_link_list_t), intent(in) :: link_list
  logical :: flag
  flag = link_list%length > 0
end function internal_link_list_has_entries

```

Return the list length

```

<Interactions: internal link list: TBP>+≡
  procedure :: get_length => internal_link_list_get_length

<Interactions: procedures>+≡
function internal_link_list_get_length (link_list) result (length)
  class(internal_link_list_t), intent(in) :: link_list
  integer :: length
  length = link_list%length
end function internal_link_list_get_length

```

Return an entry.

```

<Interactions: internal link list: TBP>+≡
  procedure :: get_link => internal_link_list_get_link

<Interactions: procedures>+≡
function internal_link_list_get_link (link_list, i) result (link)
  class(internal_link_list_t), intent(in) :: link_list
  integer, intent(in) :: i
  integer :: link
  if (i <= link_list%length) then
    link = link_list%link(i)
  else
    call msg_bug ("Internal link list: out of bounds")
  end if
end function internal_link_list_get_link

```

11.2.3 The interaction type

An interaction is an entangled system of particles. Thus, the interaction object consists of two parts: the subevent, and the quantum state which technically is a trie. The subnode levels beyond the trie root node are in correspondence to the subevent, so both should be traversed in parallel.

The subevent is implemented as an allocatable array of four-momenta. The first **n_in** particles are incoming, **n_vir** particles in-between can be kept for bookkeeping, and the last **n_out** particles are outgoing.

Distinct interactions are linked by their particles: for each particle, we have the possibility of links to corresponding particles in other interactions. Furthermore, for bookkeeping purposes we have a self-link array **relations** where the parent-child relations are kept, and a flag array **resonant** which is set for an intermediate resonance.

Each momentum is associated with masks for flavor, color, and helicity. If a mask entry is set, the associated quantum number is to be ignored for that particle. If any mask has changed, the flag **update** is set.

We can have particle pairs locked together. If this is the case, the corresponding mask entries are bound to be equal. This is useful for particles that go through the interaction.

The interaction tag serves bookkeeping purposes. In particular, it identifies links in printout.

```

<Interactions: public>+=
    public :: interaction_t

<Interactions: types>+=
    type :: interaction_t
        private
            integer :: tag = 0
            type(state_matrix_t) :: state_matrix
            integer :: n_in = 0
            integer :: n_vir = 0
            integer :: n_out = 0
            integer :: n_tot = 0
            logical, dimension(:), allocatable :: p_is_known
            type(vector4_t), dimension(:), allocatable :: p
            type(external_link_t), dimension(:), allocatable :: source
            type(internal_link_list_t), dimension(:), allocatable :: parents
            type(internal_link_list_t), dimension(:), allocatable :: children
            logical, dimension(:), allocatable :: resonant
            type(quantum_numbers_mask_t), dimension(:), allocatable :: mask
            integer, dimension(:), allocatable :: hel_lock
            logical :: update_state_matrix = .false.
            logical :: update_values = .false.
        end type interaction_t

```

Initialize the particle array with a fixed size. The first `n_in` particles are incoming, the rest outgoing. Masks are optional. There is also an optional tag. The interaction still needs fixing the values, but that is to be done after all branches have been added.

Interaction tags are assigned consecutively, using a `saved` variable local to this procedure. If desired, we can provide a seed for the interaction tags. Such a seed should be positive. The default seed is one. `tag=0` indicates an empty interaction.

If `set_relations` is set and true, we establish parent-child relations for all incoming and outgoing particles. Virtual particles are skipped; this option is normally used only for interactions without virtual particles.

```

<Interactions: public>+=
    public :: interaction_init

<Interactions: procedures>+=
    subroutine interaction_init &
        (int, n_in, n_vir, n_out, &
         tag, resonant, mask, hel_lock, set_relations, store_values)
    type(interaction_t), intent(out) :: int
    integer, intent(in) :: n_in, n_vir, n_out
    integer, intent(in), optional :: tag

    int_out%update_values = int_in%update_values
end subroutine interaction_assign

```

11.2.4 Methods inherited from the state matrix member

Until F2003 is standard, we cannot implement inheritance directly. Therefore, we need wrappers for “inherited” methods.

Make a new branch in the state matrix if it does not yet exist. This is not just a wrapper but it introduces the interaction mask: where a quantum number is masked, it is not transferred but set undefined. After this, the value array has to be updated.

```

<Interactions: public>+≡
    public :: interaction_add_state

<Interactions: procedures>+≡
    subroutine interaction_add_state &
        (int, qn, index, value, sum_values, counter_index, me_index)
        type(interaction_t), intent(inout) :: int
        type(quantum_numbers_t), dimension(:), intent(in) :: qn
        integer, intent(in), optional :: index
        complex(default), intent(in), optional :: value
        logical, intent(in), optional :: sum_values
        integer, intent(in), optional :: counter_index
        integer, intent(out), optional :: me_index
        type(quantum_numbers_t), dimension(size(qn)) :: qn_tmp
        qn_tmp = qn
        call quantum_numbers_undefine (qn_tmp, int%mask)
        call state_matrix_add_state &
            (int%state_matrix, qn_tmp, index, value, sum_values, &

```

```

        counter_index, me_index)
    int%update_values = .true.
end subroutine interaction_add_state

```

Freeze the quantum state: First collapse the quantum state, i.e., remove quantum numbers if any mask has changed, then fix the array of value pointers.

```

<Interactions: public>+≡
    public :: interaction_freeze

<Interactions: procedures>+≡
    subroutine interaction_freeze (int)
        type(interaction_t), intent(inout) :: int
        if (int%update_state_matrix) then
            call state_matrix_collapse (int%state_matrix, int%mask)
            int%update_state_matrix = .false.
            int%update_values = .true.
        end if
        if (int%update_values) then
            call state_matrix_freeze (int%state_matrix)
            int%update_values = .false.
        end if
    end subroutine interaction_freeze

```

Return true if the state matrix is empty.

```

<Interactions: public>+≡
    public :: interaction_is_empty

<Interactions: procedures>+≡
    function interaction_is_empty (int) result (flag)
        logical :: flag
        type(interaction_t), intent(in) :: int
        flag = state_matrix_is_empty (int%state_matrix)
    end function interaction_is_empty

```

Get the number of values stored in the state matrix:

```

<Interactions: public>+≡
    public :: interaction_get_n_matrix_elements

<Interactions: procedures>+≡
    function interaction_get_n_matrix_elements (int) result (n)
        integer :: n
        type(interaction_t), intent(in) :: int
        n = state_matrix_get_n_matrix_elements (int%state_matrix)
    end function interaction_get_n_matrix_elements

```

Get the norm of the state matrix (if the norm has been taken out, otherwise this would be unity).

```

<Interactions: public>+≡
    public :: interaction_get_norm

```

```

<Interactions: procedures>+≡
function interaction_get_norm (int) result (norm)
  real(default) :: norm
  type(interaction_t), intent(in) :: int
  norm = state_matrix_get_norm (int%state_matrix)
end function interaction_get_norm

```

Get the quantum number array that corresponds to a given index.

```

<Interactions: public>+≡
public :: interaction_get_quantum_numbers

<Interactions: procedures>+≡
function interaction_get_quantum_numbers (int, i) result (qn)
  type(quantum_numbers_t), dimension(:), allocatable :: qn
  type(interaction_t), intent(in), target :: int
  integer, intent(in) :: i
  allocate (qn (state_matrix_get_depth (int%state_matrix)))
  qn = state_matrix_get_quantum_numbers (int%state_matrix, i)
end function interaction_get_quantum_numbers

```

Get the matrix element that corresponds to a set of quantum numbers, a given index, or return the whole array.

```

<Interactions: public>+≡
public :: interaction_get_matrix_element

<Interactions: procedures>+≡
function interaction_get_matrix_element (int, i) result (me)
  complex(default) :: me
  type(interaction_t), intent(in) :: int
  integer, intent(in) :: i
  me = state_matrix_get_matrix_element (int%state_matrix, i)
end function interaction_get_matrix_element

```

Set the complex value(s) stored in the quantum state.

```

<Interactions: public>+≡
public :: interaction_set_matrix_element

<Interactions: interfaces>+≡
interface interaction_set_matrix_element
  module procedure interaction_set_matrix_element_qn
  module procedure interaction_set_matrix_element_all
  module procedure interaction_set_matrix_element_array
  module procedure interaction_set_matrix_element_single
  module procedure interaction_set_matrix_element_clone
end interface

```

Indirect access via the quantum number array:

```

<Interactions: procedures>+≡
subroutine interaction_set_matrix_element_qn (int, qn, val)
  type(interaction_t), intent(inout) :: int
  type(quantum_numbers_t), dimension(:), intent(in) :: qn
  complex(default), intent(in) :: val
  call state_matrix_set_matrix_element (int%state_matrix, qn, val)
end subroutine interaction_set_matrix_element_qn

```

Set all entries of the matrix-element array to a given value.

```

<Interactions: procedures>+≡
  subroutine interaction_set_matrix_element_all (int, value)
    type(interaction_t), intent(inout) :: int
    complex(default), intent(in) :: value
    call state_matrix_set_matrix_element (int%state_matrix, value)
  end subroutine interaction_set_matrix_element_all

```

Set the matrix-element array directly.

```

<Interactions: procedures>+≡
  subroutine interaction_set_matrix_element_array (int, value)
    type(interaction_t), intent(inout) :: int
    complex(default), dimension(:), intent(in) :: value
    call state_matrix_set_matrix_element (int%state_matrix, value)
  end subroutine interaction_set_matrix_element_array

  pure subroutine interaction_set_matrix_element_single (int, i, value)
    type(interaction_t), intent(inout) :: int
    integer, intent(in) :: i
    complex(default), intent(in) :: value
    call state_matrix_set_matrix_element (int%state_matrix, i, value)
  end subroutine interaction_set_matrix_element_single

```

Clone from another (matching) interaction.

```

<Interactions: procedures>+≡
  subroutine interaction_set_matrix_element_clone (int, int1)
    type(interaction_t), intent(inout) :: int
    type(interaction_t), intent(in) :: int1
    call state_matrix_set_matrix_element (int%state_matrix, int1%state_matrix)
  end subroutine interaction_set_matrix_element_clone

```

Get the indices of any diagonal matrix elements.

```

<Interactions: public>+≡
  public :: interaction_get_diagonal_entries

<Interactions: procedures>+≡
  subroutine interaction_get_diagonal_entries (int, i)
    type(interaction_t), intent(in) :: int
    integer, dimension(:), allocatable, intent(out) :: i
    call state_matrix_get_diagonal_entries (int%state_matrix, i)
  end subroutine interaction_get_diagonal_entries

```

Renormalize the state matrix by its trace, if nonzero. The renormalization is reflected in the state-matrix norm.

```

<Interactions: public>+≡
  public :: interaction_normalize_by_trace

<Interactions: procedures>+≡
  subroutine interaction_normalize_by_trace (int)
    type(interaction_t), intent(inout) :: int
    call state_matrix_normalize_by_trace (int%state_matrix)
  end subroutine interaction_normalize_by_trace

```

Analogous, but renormalize by maximal (absolute) value.

```

<Interactions: public>+≡
    public :: interaction_normalize_by_max

<Interactions: procedures>+≡
    subroutine interaction_normalize_by_max (int)
        type(interaction_t), intent(inout) :: int
        call state_matrix_normalize_by_max (int%state_matrix)
    end subroutine interaction_normalize_by_max

```

Explicitly set the norm value (of the state matrix).

```

<Interactions: public>+≡
    public :: interaction_set_norm

<Interactions: procedures>+≡
    subroutine interaction_set_norm (int, norm)
        type(interaction_t), intent(inout) :: int
        real(default), intent(in) :: norm
        call state_matrix_set_norm (int%state_matrix, norm)
    end subroutine interaction_set_norm

```

Return the maximum absolute value of color indices.

```

<Interactions: public>+≡
    public :: interaction_get_max_color_value

<Interactions: procedures>+≡
    function interaction_get_max_color_value (int) result (cmax)
        integer :: cmax
        type(interaction_t), intent(in) :: int
        cmax = state_matrix_get_max_color_value (int%state_matrix)
    end function interaction_get_max_color_value

```

Factorize the state matrix into single-particle state matrices, the branch selection depending on a (random) value between 0 and 1; optionally also return a correlated state matrix.

```

<Interactions: public>+≡
    public :: interaction_factorize

<Interactions: procedures>+≡
    subroutine interaction_factorize &
        (int, mode, x, ok, single_state, correlated_state, qn_in)
        type(interaction_t), intent(in), target :: int
        integer, intent(in) :: mode
        real(default), intent(in) :: x
        logical, intent(out) :: ok
        type(state_matrix_t), &
            dimension(:), allocatable, intent(out) :: single_state
        type(state_matrix_t), intent(out), optional :: correlated_state
        type(quantum_numbers_t), dimension(:), intent(in), optional :: qn_in
        call state_matrix_factorize &
            (int%state_matrix, mode, x, ok, single_state, correlated_state, qn_in)
    end subroutine interaction_factorize

```

Sum all matrix element values

```

<Interactions: public>+=
  public :: interaction_sum

<Interactions: procedures>+=
  function interaction_sum (int) result (value)
    complex(default) :: value
    type(interaction_t), intent(in) :: int
    value = state_matrix_sum (int%state_matrix)
  end function interaction_sum

```

Append new states which are color-contracted versions of the existing states. The matrix element index of each color contraction coincides with the index of its origin, so no new matrix elements are generated. After this operation, no **freeze** must be performed anymore.

```

<Interactions: public>+=
  public :: interaction_add_color_contractions

<Interactions: procedures>+=
  subroutine interaction_add_color_contractions (int)
    type(interaction_t), intent(inout) :: int
    call state_matrix_add_color_contractions (int%state_matrix)
  end subroutine interaction_add_color_contractions

```

Multiply matrix elements from two interactions. Choose the elements as given by the integer index arrays, multiply them and store the sum of products in the indicated matrix element. The suffixes mean: c=conjugate first factor; f=include weighting factor.

```

<Interactions: public>+=
  public :: interaction_evaluate_product

```

11.2.7 Handling Linked interactions

Store relations between corresponding particles within one interaction. The first particle is the parent, the second one the child. Links are established in both directions.

These relations have no effect on the propagation of momenta etc., they are rather used for mother-daughter relations in event output.

```

<Interactions: public>+≡
    public :: interaction_relate

<Interactions: procedures>+≡
    subroutine interaction_relate (int, i1, i2)
        type(interaction_t), intent(inout), target :: int
        integer, intent(in) :: i1, i2
        if (i1 /= 0 .and. i2 /= 0) then
            call int%children(i1)%append (i2)
            call int%parents(i2)%append (i1)
        end if
    end subroutine interaction_relate

```

Transfer internal parent-child relations defined within interaction `int1` to a new interaction `int` where the particle indices are mapped to. Some particles in `int1` may have no image in `int`. In that case, a child entry maps to zero, and we skip this relation.

Also transfer resonance flags.

```

<Interactions: public>+≡
    public :: interaction_transfer_relations

<Interactions: procedures>+≡
    subroutine interaction_transfer_relations (int1, int2, map)
        type(interaction_t), intent(in) :: int1
        type(interaction_t), intent(inout), target :: int2
        integer, dimension(:), intent(in) :: map
        integer :: i, j, k
        do i = 1, size (map)
            do j = 1, int1%parents(i)%get_length ()
                k = int1%parents(i)%get_link (j)
                call interaction_relate (int2, map(k), map(i))
            end do
        end do
    end subroutine interaction_transfer_relations

```

```

        end do
        if (map(i) /= 0) then
            int2%resonant(map(i)) = int1%resonant(i)
        end if
    end do
end subroutine interaction_transfer_relations

```

Make up internal parent-child relations for the particle(s) that are connected to a new interaction `int`.

If `resonant` is defined and true, the connections are marked as resonant in the result interaction

```

<Interactions: public>+=
    public :: interaction_relate_connections

<Interactions: procedures>+=
    subroutine interaction_relate_connections &
        (int, int_in, connection_index, &

        integer, intent(out) :: i1
        type(external_link_t) :: link
        link = interaction_get_ultimate_source (int, i)
        int1 => external_link_get_ptr (link)
        i1 = external_link_get_index (link)
    end subroutine interaction_find_source

```

```
end subroutine interaction_find_source
```

Follow source links recursively to return the ultimate source of a particle.

(Interactions: procedures)+≡

```
function interaction_get_ultimate_source (int, i) result (link)
  type(external_link_t) :: link
  type(interaction_t), intent(in) :: int
  integer, intent(in) :: i
  type(interaction_t), pointer :: int_src
  integer :: i_src
  link = int%source(i)
  if (external_link_is_set (link)) then
    do
      int_src => external_link_get_ptr (link)
      i_src = external_link_get_index (link)
      if (external_link_is_set (int_src%source(i_src))) then
        link = int_src%source(i_src)
      else
        exit
      end if
    end do
  end if
end function interaction_get_ultimate_source
```

Update mask entries by merging them with corresponding masks in interactions linked to the current one. The mask determines quantum numbers which are summed over.

Note that both the mask of the current interaction and the mask of the linked interaction are updated (side effect!). This ensures that both agree for the linked particle.

(Interactions: public)+≡

```
public :: interaction_exchange_mask
```

(Interactions: procedures)+≡

```
subroutine interaction_exchange_mask (int)
  type(interaction_t), intent(inout) :: int
  integer :: i, index_link
  type(interaction_t), pointer :: int_link
  do i = 1, int%n_tot
    if (external_link_is_set (int%source(i))) then
      int_link => external_link_get_ptr (int%source(i))
      index_link = external_link_get_index (int%source(i))
      call interaction_merge_mask_entry &
        (int, i, int_link%mask(index_link))
      call interaction_merge_mask_entry &
        (int_link, index_link, int%mask(i))
    end if
  end do
  call interaction_freeze (int)
end subroutine interaction_exchange_mask
```

Copy momenta from interactions linked to the current one.

(Interactions: public)+≡

```

public :: interaction_receive_momenta
<Interactions: procedures>+=
subroutine interaction_receive_momenta (int)
  type(interaction_t), intent(inout) :: int
  integer :: i, index_link
  type(interaction_t), pointer :: int_link
  do i = 1, int%n_tot
    if (external_link_is_set (int%source(i))) then
      int_link => external_link_get_ptr (int%source(i))
      index_link = external_link_get_index (int%source(i))
      call interaction_set_momentum (int, int_link%p(index_link), i)
    end if
  end do
end subroutine interaction_receive_momenta

```

The inverse operation: Copy momenta back to the interactions linked to the current one.

```

<Interactions: public>+=
public :: interaction_send_momenta
<Interactions: procedures>+=
subroutine interaction_send_momenta (int)
  type(interaction_t), intent(in) :: int
  integer :: i, index_link
  type(interaction_t), pointer :: int_link
  do i = 1, int%n_tot
    if (external_link_is_set (int%source(i))) then
      int_link => external_link_get_ptr (int%source(i))
      index_link = external_link_get_index (int%source(i))
      call interaction_set_momentum (int_link, int%p(i), index_link)
    end if
  end do
end subroutine interaction_send_momenta

```

For numerical comparisons: pacify all momenta in an interaction.

```

<Interactions: public>+=
public :: interaction_pacify_momenta
<Interactions: procedures>+=
subroutine interaction_pacify_momenta (int, acc)
  type(interaction_t), intent(inout) :: int
  real(default), intent(in) :: acc
  integer :: i
  do i = 1, int%n_tot
    call pacify (int%p(i), acc)
  end do
end subroutine interaction_pacify_momenta

```

11.2.8 Recovering connections

When creating an evaluator for two interactions, we have to know by which particles they are connected. The connection indices can be determined if we

have two linked interactions. We assume that `int1` is the source and `int2` the target, so the connections of interest are stored within `int2`. A connection is found if either the source is `int1`, or the (ultimate) source of a particle within `int2` coincides with the (ultimate) source of a particle within `int1`. The result is an array of index pairs.

To make things simple, we scan the interaction twice, once for counting hits, then allocate the array, then scan again and store the connections.

The connections are scanned for `int2`, which has sources in `int1`. It may happen that the order of connections is interchanged (crossed). We require the indices in `int1` to be sorted, so we reorder both index arrays correspondingly before returning them. (After this, the indices in `int2` may be out of order.)

```

<Interactions: public>+=
  public :: find_connections

<Interactions: procedures>+=
  subroutine find_connections (int1, int2, n, connection_index)
    type(interaction_t), intent(in) :: int1, int2

11.2.9 Unit tests

```

<Interactions: public>+≡
    public :: interaction_test

<Interactions: procedures>+≡
    subroutine interaction_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <Interactions: execute tests>
    end subroutine interaction_test

```

Generate an interaction of a polarized virtual photon and a colored quark which may be either up or down. Remove the quark polarization. Generate another interaction for the quark radiating a photon and link this to the first interaction. The radiation ignores polarization; transfer this information to the first interaction to simplify it. Then, transfer the momentum to the radiating quark and perform a splitting.

11.3 Matrix element evaluation

The `evaluator_t` type is an extension of the `interaction_t` type. It represents either a density matrix as the square of a transition matrix element, or the product of two density matrices. Usually, some quantum numbers are summed over in the result.

The `interaction_t` subobject represents a multi-particle interaction with incoming, virtual, and outgoing particles and the associated (not necessarily diagonal) density matrix of quantum state. When the evaluator is initialized, this interaction is constructed from the input `interaction(s)`.

In addition, the initialization process sets up a multiplication table. For each matrix element of the result, it states which matrix elements are to be taken from the input `interaction(s)`, multiplied (optionally, with an additional weight factor) and summed over.

Eventually, to a processes we associate a chain of evaluators which are to be evaluated sequentially. The physical event and its matrix element value(s) can be extracted from the last evaluator in such a chain.

Evaluators are constructed only once (as long as this is possible) during an initialization step. Then, for each event, momenta are computed and transferred among evaluators using the links within the interaction subobject. The multiplication tables enable fast evaluation of the result without looking at quantum numbers anymore.

  use state_matrices
  use interactions

  <Standard module head>

  <Evaluators: public>

  <Evaluators: parameters>

  <Evaluators: types>

  <Evaluators: interfaces>

  contains

  <Evaluators: procedures>

  <Evaluators: tests>

end module evaluators

```

11.3.1 Array of pairings

The evaluator contains an array of `pairing_array` objects. This makes up the multiplication table.

Each pairing array contains two list of matrix element indices and a list of numerical factors. The matrix element indices correspond to the input interactions. The corresponding matrix elements are to be multiplied and optionally multiplied by a factor. The results are summed over to yield one specific matrix element of the result evaluator.

```

<Evaluators: types>≡
  type :: pairing_array_t
    integer, dimension(:), allocatable :: i1, i2
    complex(default), dimension(:), allocatable :: factor
  end type pairing_array_t

```

```

<Evaluators: procedures>≡
  elemental subroutine pairing_array_init (pa, n, has_i2, has_factor)
    type(pairing_array_t), intent(out) :: pa
    integer, intent(in) :: n
    logical, intent(in) :: has_i2, has_factor
    allocate (pa%i1 (n))
    if (has_i2) allocate (pa%i2 (n))
    if (has_factor) allocate (pa%factor (n))
  end subroutine pairing_array_init

```

11.3.2 The evaluator type

Possible variants of evaluators:

```

<Evaluators: parameters>≡
  integer, parameter :: &
    EVAL_UNDEFINED = 0, &
    EVAL_PRODUCT = 1, &
    EVAL_SQUARED_FLOWS = 2, &
    EVAL_SQUARE_WITH_COLOR_FACTORS = 3, &
    EVAL_COLOR_CONTRACTION = 4, &
    EVAL_IDENTITY = 5, &
    EVAL_QN_SUM = 6

```

The evaluator type contains the result interaction and an array of pairing lists, one for each matrix element in the result interaction.

```

<Evaluators: public>≡
  public :: evaluator_t

<Evaluators: types>+≡
  type :: evaluator_t
    private
    integer :: type = EVAL_UNDEFINED
    type(interaction_t), pointer :: int_in1 => null ()
    type(interaction_t), pointer :: int_in2 => null ()
    type(interaction_t) :: int
    type(pairing_array_t), dimension(:), allocatable :: pairing_array
  contains
    <Evaluators: evaluator: TBP>
  end type evaluator_t

```

Output.

```

11.3.3 Auxiliary structures for evaluator creation

Creating an evaluator that properly handles all quantum numbers requires some bookkeeping. In this section, we define several auxiliary types and methods that organize and simplify this task. More structures are defined within the specific initializers (as local types and internal subroutines).

These types are currently implemented in a partial object-oriented way: We define some basic methods for initialization etc. here, but the evaluator routines below do access their internals as well. This simplifies some things such as index addressing using array slices, at the expense of losing some clarity.

Index mapping

Index mapping are abundant when constructing an evaluator. To have arrays of index mappings, we define this:

```
<Evaluators: types>+≡
    type :: index_map_t
        integer, dimension(:), allocatable :: entry
    end type index_map_t

<Evaluators: procedures>+≡
    elemental subroutine index_map_init (map, n)
        type(index_map_t), intent(out) :: map
        integer, intent(in) :: n
        allocate (map%entry (n))
    end subroutine index_map_init

<Evaluators: procedures>+≡
    function index_map_exists (map) result (flag)
        logical :: flag
        type(index_map_t), intent(in) :: map
        flag = allocated (map%entry)
    end function index_map_exists

<Evaluators: interfaces>+≡
    interface size
        module procedure index_map_size
    end interface

<Evaluators: procedures>+≡
    function index_map_size (map) result (s)
        integer :: s
        type(index_map_t), intent(in) :: map
        if (allocated (map%entry)) then
            s = size (map%entry)
        else
            s = 0
        end if
    end function index_map_size

<Evaluators: interfaces>+≡
    interface assignment(=)
        module procedure index_map_assign_int
        module procedure index_map_assign_array
    end interface

<Evaluators: procedures>+≡
    elemental subroutine index_map_assign_int (map, ival)
        type(index_map_t), intent(inout) :: map
        integer, intent(in) :: ival
        map%entry = ival
    end subroutine index_map_assign_int
```

```

subroutine index_map_assign_array (map, array)
  type(index_map_t), intent(inout) :: map
  integer, dimension(:), intent(in) :: array
  map%entry = array
end subroutine index_map_assign_array

```

(Evaluators: procedures)+≡

```

elemental subroutine index_map_set_entry (map, i, ival)
  type(index_map_t), intent(inout) :: map
  integer, intent(in) :: i
  integer, intent(in) :: ival
  map%entry(i) = ival
end subroutine index_map_set_entry

```

(Evaluators: procedures)+≡

```

elemental function index_map_get_entry (map, i) result (ival)
  integer :: ival
  type(index_map_t), intent(in) :: map
  integer, intent(in) :: i
  ival = map%entry(i)
end function index_map_get_entry

```

Index mapping (two-dimensional)

This is a variant with a square matrix instead of an array.

(Evaluators: types)+≡

```

type :: index_map2_t
  integer :: s = 0
  integer, dimension(:,:), allocatable :: entry
end type index_map2_t

```

(Evaluators: procedures)+≡

```

elemental subroutine index_map2_init (map, n)
  type(index_map2_t), intent(out) :: map
  integer, intent(in) :: n
  map%s = n
  allocate (map%entry (n, n))
end subroutine index_map2_init

```

(Evaluators: procedures)+≡

```

function index_map2_exists (map) result (flag)
  logical :: flag
  type(index_map2_t), intent(in) :: map
  flag = allocated (map%entry)
end function index_map2_exists

```

(Evaluators: interfaces)+≡

```

interface size
  module procedure index_map2_size
end interface

```

```

<Evaluators: procedures>+≡
function index_map2_size (map) result (s)
  integer :: s
  type(index_map2_t), intent(in) :: map
  s = map%s
end function index_map2_size

<Evaluators: interfaces>+≡
interface assignment(=)
  module procedure index_map2_assign_int
end interface

<Evaluators: procedures>+≡
elemental subroutine index_map2_assign_int (map, ival)
  type(index_map2_t), intent(inout) :: map
  integer, intent(in) :: ival
  map%entry = ival
end subroutine index_map2_assign_int

<Evaluators: procedures>+≡
elemental subroutine index_map2_set_entry (map, i, j, ival)
  type(index_map2_t), intent(inout) :: map
  integer, intent(in) :: i, j
  integer, intent(in) :: ival
  map%entry(i,j) = ival
end subroutine index_map2_set_entry

<Evaluators: procedures>+≡
elemental function index_map2_get_entry (map, i, j) result (ival)
  integer :: ival
  type(index_map2_t), intent(in) :: map
  integer, intent(in) :: i, j
  ival = map%entry(i,j)
end function index_map2_get_entry

```

Auxiliary structures: particle mask

This is a simple container of a logical array.

```

<Evaluators: types>+≡
type :: prt_mask_t
  logical, dimension(:), allocatable :: entry
end type prt_mask_t

<Evaluators: procedures>+≡
subroutine prt_mask_init (mask, n)
  type(prt_mask_t), intent(out) :: mask
  integer, intent(in) :: n
  allocate (mask%entry (n))
end subroutine prt_mask_init

```

```

<Evaluators: interfaces>+≡
  interface size
    module procedure prt_mask_size
  end interface

<Evaluators: procedures>+≡
  function prt_mask_size (mask) result (s)
    integer :: s
    type(prt_mask_t), intent(in) :: mask
    s = size (mask%entry)
  end function prt_mask_size

```

Quantum number containers

Trivial transparent containers:

```

<Evaluators: types>+≡
  type :: qn_list_t
    type(quantum_numbers_t), dimension(:,:), allocatable :: qn
  end type qn_list_t

  type :: qn_mask_array_t
    type(quantum_numbers_mask_t), dimension(:), allocatable :: mask
  end type qn_mask_array_t

```

Auxiliary structures: connection entries

This type is used as intermediate storage when computing the product of two evaluators or the square of an evaluator. The quantum-number array **qn** corresponds to the particles common to both interactions, but irrelevant quantum numbers (color) masked out. The index arrays **index_in** determine the entries in the input interactions that contribute to this connection. **n_index** is the size of these arrays, and **count** is used while filling the entries. Finally, the quantum-number arrays **qn_in_list** are the actual entries in the input interaction that contribute. In the product case, they exclude the connected quantum numbers.

Each evaluator has its own **connection_table** which contains an array of **connection_entry** objects, but also has stuff that specifically applies to the evaluator type. Hence, we do not generalize the **connection_table_t** type.

The filling procedure **connection_entry_add_state** is specific to the various evaluator types.

```

<Evaluators: types>+≡
  type :: connection_entry_t
    type(quantum_numbers_t), dimension(:), allocatable :: qn_conn
    integer, dimension(:), allocatable :: n_index
    integer, dimension(:), allocatable :: count
    type(index_map_t), dimension(:), allocatable :: index_in
    type(qn_list_t), dimension(:), allocatable :: qn_in_list
  end type connection_entry_t

```

(Evaluators: procedures) +=

```

subroutine connection_entry_init &
  (entry, n_count, n_map, qn_conn, count, n_rest)
  type(connection_entry_t), intent(out) :: entry
  integer, intent(in) :: n_count, n_map
  type(quantum_numbers_t), dimension(:), intent(in) :: qn_conn
  integer, dimension(n_count), intent(in) :: count
  integer, dimension(n_count), intent(in) :: n_rest
  integer :: i
  allocate (entry%qn_conn (size (qn_conn)))
  allocate (entry%n_index (n_count))
  allocate (entry%count (n_count))
  allocate (entry%index_in (n_map))
  allocate (entry%qn_in_list (n_count))
  entry%qn_conn = qn_conn
  entry%n_index = count
  entry%count = 0
  if (size (entry%index_in) == size (count)) then
    call index_map_init (entry%index_in, count)
  else
    call index_map_init (entry%index_in, count(1))
  end if
  do i = 1, n_count
    allocate (entry%qn_in_list(i)%qn (n_rest(i), count(i)))
  end do
end subroutine connection_entry_init

```

(Evaluators: procedures) +=

```

subroutine connection_entry_write (entry, unit)
  type(connection_entry_t), intent(in) :: entry
  integer, intent(in), optional :: unit
  integer :: i, j
  integer :: u
  u = given_output_unit (unit)
  call quantum_numbers_write (entry%qn_conn, unit)
  write (u, *)
  do i = 1, size (entry%n_index)
    write (u, *) "Input interaction", i
    do j = 1, entry%n_index(i)
      if (size (entry%n_index) == size (entry%index_in)) then
        write (u, "(2x,I0,4x,I0,2x)", advance = "no") &
          j, index_map_get_entry (entry%index_in(i), j)
      else
        write (u, "(2x,I0,4x,I0,2x,I0,2x)", advance = "no") &
          j, index_map_get_entry (entry%index_in(1), j), &
          index_map_get_entry (entry%index_in(2), j)
      end if
      call quantum_numbers_write (entry%qn_in_list(i)%qn(:,j), unit)
      write (u, *)
    end do
  end do
end subroutine connection_entry_write

```

Color handling

For managing color-factor computation, we introduce this local type. The `index` is the index in the color table that corresponds to a given matrix element index in the input interaction. The `col` array stores the color assignments in rows. The `factor` array associates a complex number with each pair of arrays in the color table. The `factor_is_known` array reveals whether a given factor is known already or still has to be computed.

(Evaluators: types)+≡

```
type :: color_table_t
  integer, dimension(:), allocatable :: index
  type(color_t), dimension(:, :), allocatable :: col
  logical, dimension(:, :), allocatable :: factor_is_known
  complex(default), dimension(:, :), allocatable :: factor
end type color_table_t
```

This is the initializer. We extract the color states from the given state matrices, establish index mappings between the two states (implemented by the array `me_index`), make an array of color states, and initialize the color-factor table. The latter is two-dimensional (includes interference) and not yet filled.

(Evaluators: procedures)+≡

```
subroutine color_table_init (color_table, state, n_tot)
  type(color_table_t), intent(out) :: color_table
  type(state_matrix_t), intent(in) :: state
  integer, intent(in) :: n_tot
  type(state_iterator_t) :: it
  type(quantum_numbers_t), dimension(:), allocatable :: qn
  type(state_matrix_t) :: state_col
  integer :: index, n_col_state
  allocate (color_table%index &
    (state_matrix_get_n_matrix_elements (state)))
  color_table%index = 0
  allocate (qn (n_tot))
  call state_matrix_init (state_col)
  call state_iterator_init (it, state)
  do while (state_iterator_is_valid (it))

```

This subroutine sets color factors, based on information from the hard matrix element: the list of pairs of color-flow indices (in the basis of the matrix element code), the list of corresponding factors, and the list of mappings from the matrix element index in the input interaction to the color-flow index in the hard matrix element object.

We first determine the mapping of color-flow indices from the hard matrix element code to the current color table. The mapping could be nontrivial because the latter is derived from iterating over a state matrix, which may return states in non-canonical order. The translation table can be determined because we have, for the complete state matrix, both the mapping to the hard interaction (the input `col_index_hi`) and the mapping to the current color table (the component `color_table%index`).

Once this mapping is known, we scan the list of index pairs `color_flow_index` and translate them to valid color-table index pairs. For this pair, the color factor is set using the corresponding entry in the list `col_factor`.

end subroutine color_table_set_color_factors

```

This function returns a color factor, given two indices which point to the matrix elements of the initial state matrix. Internally, we can map them to the corresponding indices in the color table. As a side effect, we store the color factor in the color table for later lookup. (I.e., this function is impure.)

11.3.4 Creating an evaluator: Matrix multiplication

The evaluator for matrix multiplication is the most complicated variant.

The initializer takes two input interactions and constructs the result evaluator, which consists of the interaction and the multiplication table for the product (or convolution) of the two. Normally, the input interactions are connected by one or more common particles (e.g., decay, structure function convolution).

In the result interaction, quantum numbers of the connections can be summed over. This is determined by the `qn_mask_conn` argument. The `qn_mask_rest` argument is its analog for the other particles within the result interaction. (E.g., for the trace of the state matrix, all quantum numbers are summed over.) Finally, the `connections_are_resonant` argument tells whether the connecting particles should be marked as resonant in the final event record. This is useful for decays.

The algorithm consists of the following steps:

1. **find_connections:** Find the particles which are connected, i.e., common to both input interactions. Either they are directly linked, or both are linked to a common source.
2. **compute_index_bounds_and_mappings:** Compute the mappings of particle indices from the input interactions to the result interaction. There is a separate mapping for the connected particles.
3. **accumulate_connected_states:** Create an auxiliary state matrix which lists the possible quantum numbers for the connected particles. When building this matrix, count the number of times each assignment is contained in any of the input states and, for each of the input states, record the index of the matrix element within the new state matrix. For the connected particles, reassign color indices such that no color state is present twice in different color-index assignment. Note that helicity assignments of the connected state can be (and will be) off-diagonal, so no spin correlations are lost in decays.
Do this for both input interactions.
4. **allocate_connection_entries:** Allocate a table of connections. Each table row corresponds to one state in the auxiliary matrix, and to multiple states of the input interactions. It collects all states of the unconnected particles in the two input interactions that are associated with the particular state (quantum-number assignment) of the connected particles.
5. **fill_connection_table:** Fill the table of connections by scanning both input interactions. When copying states, reassign color indices for the unconnected particles such that they match between all involved particle sets (interaction 1, interaction 2, and connected particles).
6. **make_product_interaction:** Scan the table of connections we have just built. For each entry, construct all possible pairs of states of the unconnected particles and combine them with the specific connected-particle

state. This is a possible quantum-number assignment of the result interaction. Now mask all quantum numbers that should be summed over, and append this to the result state matrix. Record the matrix element index of the result. We now have the result interaction.

7. **make_pairing_array**: First allocate the pairing array with the number of entries of the result interaction. Then scan the table of connections again. For each entry, record the indices of the matrix elements which have to be multiplied and summed over in order to compute this particular matrix element. This makes up the multiplication table.
8. **record_links**: Transfer all source pointers from the input interactions to the result interaction. Do the same for the internal parent-child relations and resonance assignments. For the connected particles, make up appropriate additional parent-child relations. This allows for fetching momenta from other interactions when a new event is filled, and to reconstruct the event history when the event is analyzed.

After all this is done, for each event, we just have to evaluate the pairing arrays (multiplication tables) in order to compute the result matrix elements in their proper positions. The quantum-number assignments remain fixed from now on.

```

11.3.5 Creating an evaluator: square

The generic initializer for an evaluator that squares a matrix element. Depending on the provided mask, we select the appropriate specific initializer for either diagonal or non-diagonal helicity density matrices.

```

(Evaluators: public)+≡
    public :: evaluator_init_square

(Evaluators: procedures)+≡
    subroutine evaluator_init_square (eval, int_in, qn_mask, &
        col_flow_index, col_factor, col_index_hi, expand_color_flows, nc)
        type(evaluator_t), intent(out), target :: eval
        type(interaction_t), intent(in), target :: int_in
        type(quantum_numbers_mask_t), dimension(:), intent(in) :: qn_mask
        integer, dimension(:,:), intent(in), optional :: col_flow_index
        complex(default), dimension(:), intent(in), optional :: col_factor
        integer, dimension(:), intent(in), optional :: col_index_hi
        logical, intent(in), optional :: expand_color_flows
        integer, intent(in), optional :: nc
        if (all (quantum_numbers_mask_diagonal_helicity (qn_mask))) then
            call evaluator_init_square_diag (eval, int_in, qn_mask, &
                col_flow_index, col_factor, col_index_hi, expand_color_flows, nc)
        else
            call evaluator_init_square_nondiag (eval, int_in, qn_mask, &
                col_flow_index, col_factor, col_index_hi, expand_color_flows, nc)
        end if
    end subroutine evaluator_init_square

```

Color-summed squared matrix (diagonal helicities)

The initializer for an evaluator that squares a matrix element, including color factors. The mask must be such that off-diagonal matrix elements are excluded.

If `color_flows` is set, the evaluator keeps color-flow entries separate and drops all interfering color structures. The color factors are set to unity in this case.

There is only one input interaction. The quantum-number mask is an array, one entry for each particle, so they can be treated individually. For academic purposes, we allow for the number of colors being different from three (but 3 is the default).

The algorithm is analogous to multiplication, with a few notable differences:

1. The connected particles are known, the correspondence is one-to-one. All particles are connected, and the mapping of indices is trivial, which simplifies the following steps.

2. **accumulate_connected_states**: The matrix of connected states encompasses all particles, but color indices are removed. However, ghost states are still kept separate from physical color states. No color-index reassignment is necessary.
3. The table of connections contains single index and quantum-number arrays instead of pairs of them. They are paired with themselves in all possible ways.
4. **make_squared_interaction**: Now apply the predefined quantum-numbers mask, which usually collects all color states (physical and ghosts), and possibly a helicity sum.
5. **make_pairing_array**: For each pair of input states, compute the color factor (including a potential ghost-parity sign) and store this in the pairing array together with the matrix-element indices for multiplication.
6. **record_links**: This is again trivial due to the one-to-one correspondence.

```

end subroutine evaluator_init_square_diag

```

Color-summed squared matrix (support nodiagonal helicities)

The initializer for an evaluator that squares a matrix element, including color factors. Unless requested otherwise by the quantum-number mask, the result

contains off-diagonal matrix elements. (The input interaction must be diagonal since it represents an amplitude, not a density matrix.)

There is only one input interaction. The quantum-number mask is an array, one entry for each particle, so they can be treated individually. For academic purposes, we allow for the number of colors being different from three (but 3 is the default).

The algorithm is analogous to the previous one, with some additional complications due to the necessity to loop over two helicity indices.

```

Copy with additional contracted color states

This evaluator involves no square or multiplication, its matrix elements are just copies of the (single) input interaction. However, the state matrix of the interaction contains additional states that have color indices contracted. This is used for copies of the beam or structure-function interactions that need to match the hard interaction also in the case where its color indices coincide.

```

Auxiliary procedure for initialization

This will become a standard procedure in F2008. The result is true if the number of true values in the mask is odd. We use the function for determining

the ghost parity of a quantum-number array.

```
(Evaluators: procedures)+≡  
function parity (mask)  
  logical :: parity  
  logical, dimension(:) :: mask  
  integer :: i  
  parity = .false.  
  do i = 1, size (mask)  
    if (mask(i)) parity = .not. parity  
  end do  
end function parity
```

11.3.6 Accessing contents

Return the interaction component, as a pointer to avoid any copying.

```
(Evaluators: public)+≡  
public :: evaluator_get_int_ptr  
  
(Evaluators: procedures)+≡  
function evaluator_get_int_ptr (eval) result (int)  
  type(interaction_t), pointer :: int  
  type(enumerator_t), intent(in), target :: eval  
  int => eval%int  
end function evaluator_get_int_ptr
```

11.3.7 Inherited procedures

Return true if the state matrix within the interaction is empty.

```
(Evaluators: public)+≡  
public :: evaluator_is_empty  
  
(Evaluators: procedures)+≡  
function evaluator_is_empty (eval) result (flag)  
  logical :: flag  
  type(enumerator_t), intent(in) :: eval  
  flag = interaction_is_empty (eval%int)  
end function evaluator_is_empty
```

Return the integer tag.

```
(Evaluators: public)+≡  
public :: evaluator_get_tag  
  
(Evaluators: procedures)+≡

    end subroutine evaluator_final

```

11.3.9 Creating an evaluator: identity

The identity evaluator creates a copy of the first input evaluator; the second input is not used.

All particles link back to the input evaluator and the internal relations are copied. As evaluation does take a shortcut by cloning the matrix elements, the pairing array is not used and does not have to be set up.

```

(Evaluators: public)+≡
    public :: evaluator_init_identity

(Evaluators: interfaces)+≡
    interface evaluator_init_identity
        module procedure evaluator_init_identity_i
        module procedure evaluator_init_identity_e
    end interface

```

11.3.10 Creating an evaluator: quantum number sum

This evaluator operates on the diagonal of a density matrix and sums over the quantum numbers specified by the mask. The optional argument **drop** allows to drop a particle from the resulting density matrix. The handling of virtuals is not completely sane, especially in connection with dropping particles.

When summing over matrix element entries, we keep the separation into entries and normalization (in the corresponding evaluation routine below).

```

<Evaluators: public>+≡
public :: evaluator_init_qn_sum

<Evaluators: interfaces>+≡
interface evaluator_init_qn_sum
    module procedure evaluator_init_qn_sum_i
    module procedure evaluator_init_qn_sum_e
end interface

```

```

11.3.11 Evaluation

When the input interactions (which are pointed to in the pairings stored within the evaluator) are filled with values, we can activate the evaluator, i.e., calculate the result values which are stored in the interaction.

The evaluation of matrix elements can be done in parallel. A `forall` construct is not appropriate, however. We would need `do concurrent` here. Nevertheless, the evaluation functions are marked as `pure`.

```

<Evaluators: evaluator: TBP>+≡
  procedure :: evaluate => evaluator_evaluate

<Evaluators: procedures>+≡

```

11.3.12 Unit tests

Test: Create two interactions. The interactions are twofold connected. The first connection has a helicity index that is kept, the second connection has a helicity index that is summed over. Concatenate the interactions in an evaluator, which thus contains a result interaction. Fill the input interactions with values, activate the evaluator and print the result.

```

Chapter 12

Sindarin Built-In Types

Here, we define a couple of types and objects which are useful both internally for WHIZARD, and visible to the user, so they correspond to Sindarin types.

particle_specifiers Expressions for particles and particle alternatives, involving particle names.

pdg_arrays Integer (PDG) codes for particles. Useful for particle aliases (e.g., 'quark' for u, d, s etc.).

jets Define (pseudo)jets as objects. Functional only if the **fastjet** library is linked. (This may change in the future.)

subevents Particle collections built from event records, for use in analysis and other Sindarin expressions

analysis Observables, histograms, and plots.

12.1 Particle Specifiers

In this module we introduce a type for specifying a particle or particle alternative. In addition to the particle specifiers (strings separated by colons), the type contains an optional flag **polarized** and a string **decay**. If the **polarized** flag is set, particle polarization information should be kept when generating events for this process. If the **decay** string is set, it is the ID of a decay process which should be applied to this particle when generating events.

In input/output form, the **polarized** flag is indicated by an asterisk (*) in brackets, and the **decay** is indicated by its ID in brackets.

The **read** and **write** procedures in this module are not type-bound but generic procedures which handle scalar and array arguments.

```
(particle_specifiers.f90)≡  
  <File header>  
  
  module particle_specifiers  
  
    <Use strings>  
    use io_units  
    use unit_tests  
    use diagnostics  
  
    <Standard module head>  
  
    <Particle specifiers: public>  
  
    <Particle specifiers: types>  
  
    <Particle specifiers: interfaces>  
  
    contains  
  
    <Particle specifiers: procedures>  
  
    <Particle specifiers: tests>  
  
  end module particle_specifiers
```

12.1.1 Base type

This is an abstract type which can hold a single particle or an expression.

```
<Particle specifiers: types>≡  
  type, abstract :: prt_spec_expr_t  
  contains  
    <Particle specifiers: prt spec expr: TBP>  
  end type prt_spec_expr_t
```

Output, as a string.

```
<Particle specifiers: prt spec expr: TBP>≡  
  procedure (prt_spec_expr_to_string), deferred :: to_string
```

```

<Particle specifiers: interfaces>≡
  abstract interface
    function prt_spec_expr_to_string (object) result (string)
      import
      class(prt_spec_expr_t), intent(in) :: object
      type(string_t) :: string
    end function prt_spec_expr_to_string
  end interface

```

Call an `expand` method for all enclosed subexpressions (before handling the current expression).

```

<Particle specifiers: prt spec expr: TBP>+≡
  procedure (prt_spec_expr_expand_sub), deferred :: expand_sub

<Particle specifiers: interfaces>+≡
  abstract interface
    subroutine prt_spec_expr_expand_sub (object)
      import
      class(prt_spec_expr_t), intent(inout) :: object
    end subroutine prt_spec_expr_expand_sub
  end interface

```

12.1.2 Wrapper type

This wrapper can hold a particle expression of any kind. We need it so we can make variadic arrays.

```

<Particle specifiers: public>≡
  public :: prt_expr_t

<Particle specifiers: types>+≡
  type :: prt_expr_t
    class(prt_spec_expr_t), allocatable :: x
    contains
    <Particle specifiers: prt expr: TBP>
  end type prt_expr_t

```

Output as a string: delegate.

```

<Particle specifiers: prt expr: TBP>≡
  procedure :: to_string => prt_expr_to_string

<Particle specifiers: procedures>≡
  recursive function prt_expr_to_string (object) result (string)
    class(prt_expr_t), intent(in) :: object
    type(string_t) :: string
    if (allocated (object%x)) then
      string = object%x%to_string ()
    else
      string = ""
    end if
  end function prt_expr_to_string

```

Allocate the expression as a particle specifier and copy the value.

```

(Particle specifiers: prt expr: TBP)+≡
  procedure :: init_spec => prt_expr_init_spec

(Particle specifiers: procedures)+≡
  subroutine prt_expr_init_spec (object, spec)
    class(prt_expr_t), intent(out) :: object
    type(prt_spec_t), intent(in) :: spec
    allocate (prt_spec_t :: object%x)
    select type (x => object%x)
      type is (prt_spec_t)
        x = spec
    end select
  end subroutine prt_expr_init_spec

```

Allocate as a list/sum and allocate for a given length

```

(Particle specifiers: prt expr: TBP)+≡
  procedure :: init_list => prt_expr_init_list
  procedure :: init_sum => prt_expr_init_sum

(Particle specifiers: procedures)+≡
  subroutine prt_expr_init_list (object, n)
    class(prt_expr_t), intent(out) :: object
    integer, intent(in) :: n
    allocate (prt_spec_list_t :: object%x)
    select type (x => object%x)
      type is (prt_spec_list_t)
        allocate (x%expr (n))
    end select
  end subroutine prt_expr_init_list

  subroutine prt_expr_init_sum (object, n)
    class(prt_expr_t), intent(out) :: object
    integer, intent(in) :: n
    allocate (prt_spec_sum_t :: object%x)
    select type (x => object%x)
      type is (prt_spec_sum_t)
        allocate (x%expr (n))
    end select
  end subroutine prt_expr_init_sum

```

Return the number of terms. This is unity, except if the expression is a sum.

```

(Particle specifiers: prt expr: TBP)+≡
  procedure :: get_n_terms => prt_expr_get_n_terms

(Particle specifiers: procedures)+≡
  function prt_expr_get_n_terms (object) result (n)
    class(prt_expr_t), intent(in) :: object
    integer :: n
    if (allocated (object%x)) then
      select type (x => object%x)
        type is (prt_spec_sum_t)
          n = size (x%expr)
      class default
    end if
  end function prt_expr_get_n_terms

```

```

        n = 1
    end select
else
    n = 0
end if
end function prt_expr_get_n_terms

```

Transform one of the terms, as returned by the previous method, to an array of particle specifiers. The array has more than one entry if the selected term is a list. This makes sense only if the expression has been completely expanded, so the list contains only atoms.

```

⟨Particle specifiers: prt_expr: TBP⟩+≡
    procedure :: term_to_array => prt_expr_term_to_array

⟨Particle specifiers: procedures⟩+≡
    recursive subroutine prt_expr_term_to_array (object, array, i)
        class(prt_expr_t), intent(in) :: object
        type(prt_spec_t), dimension(:), intent(inout), allocatable :: array
        integer, intent(in) :: i
        integer :: j
        if (allocated (array)) deallocate (array)
        select type (x => object%x)
        type is (prt_spec_t)
            allocate (array (1))
            array(1) = x
        type is (prt_spec_list_t)
            allocate (array (size (x%expr)))
            do j = 1, size (array)
                select type (y => x%expr(j)%x)
                type is (prt_spec_t)
                    array(j) = y
                end select
            end do
        type is (prt_spec_sum_t)

        end select
    end subroutine prt_expr_term_to_array

```

12.1.3 The atomic type

The trivial case is a single particle, including optional decay and polarization attributes.

Definition

The particle is unstable if the `decay` array is allocated. The `polarized` flag and decays may not be set simultaneously.

```

⟨Particle specifiers: public⟩+≡
    public :: prt_spec_t

```

```

<Particle specifiers: types>+≡
  type, extends (prt_spec_expr_t) :: prt_spec_t
  private
    type(string_t) :: name
    logical :: polarized = .false.
    type(string_t), dimension(:), allocatable :: decay
  contains
    <Particle specifiers: prt spec: TBP>
  end type prt_spec_t

```

I/O

Output. Old-style subroutines.

```

<Particle specifiers: public>+≡
  public :: prt_spec_write

<Particle specifiers: interfaces>+≡
  interface prt_spec_write
    module procedure prt_spec_write1
    module procedure prt_spec_write2
  end interface prt_spec_write

<Particle specifiers: procedures>+≡
  subroutine prt_spec_write1 (object, unit, advance)
    type(prt_spec_t), intent(in) :: object
    integer, intent(in), optional :: unit
    character(len=*), intent(in), optional :: advance
    character(3) :: adv
    integer :: u
    u = given_output_unit (unit)
    adv = "yes"; if (present (advance)) adv = advance
    write (u, "(A)", advance = adv) char (object%to_string ())
  end subroutine prt_spec_write1

```

Write an array as a list of particle specifiers.

```

<Particle specifiers: procedures>+≡
  subroutine prt_spec_write2 (prt_spec, unit, advance)
    type(prt_spec_t), dimension(:), intent(in) :: prt_spec
    integer, intent(in), optional :: unit
    character(len=*), intent(in), optional :: advance
    character(3) :: adv
    integer :: u, i
    u = given_output_unit (unit)
    adv = "yes"; if (present (advance)) adv = advance
    do i = 1, size (prt_spec)
      if (i > 1) write (u, "(A)", advance="no") " ", "
      call prt_spec_write (prt_spec(i), u, advance="no")
    end do
    write (u, "(A)", advance = adv)
  end subroutine prt_spec_write2

```

Read. Input may be string or array of strings.

```
<Particle specifiers: public>+≡
  public :: prt_spec_read
```

```
<Particle specifiers: interfaces>+≡
  interface prt_spec_read
    module procedure prt_spec_read1
    module procedure prt_spec_read2
  end interface prt_spec_read
```

Read a single particle specifier

```
<Particle specifiers: procedures>+≡
  pure subroutine prt_spec_read1 (prt_spec, string)
    type(prt_spec_t), intent(out) :: prt_spec

```

Miscellaneous

There is nothing to expand here:

```

<Particle specifiers: prt spec: TBP>+≡
  procedure :: expand_sub => prt_spec_expand_sub

<Particle specifiers: procedures>+≡
  subroutine prt_spec_expand_sub (object)
    class(prt_spec_t), intent(inout) :: object
  end subroutine prt_spec_expand_sub

```

12.1.4 List

A list of particle specifiers, indicating, e.g., the final state of a process.

```

(Particle specifiers: public)+≡
    public :: prt_spec_list_t

(Particle specifiers: types)+≡
    type, extends (prt_spec_expr_t) :: prt_spec_list_t
        type(prt_expr_t), dimension(:), allocatable :: expr
        contains
        (Particle specifiers: prt spec list: TBP)
    end type prt_spec_list_t

```

Output: Concatenate the components. Insert brackets if the component is also a list. The components of the `expr` array, if any, should all be filled.

```

(Particle specifiers: prt spec list: TBP)≡
    procedure :: to_string => prt_spec_list_to_string

  else
    ii(k) = 1
  end if
end do INCR_INDEX
end do
end select
end if
end select
if (allocated (new_object)) call move_alloc (from = new_object, to = object)
end subroutine distribute_prt_spec_list

```

Apply `expand` to all components of the list.

```

<Particle specifiers: prt spec list: TBP>+≡
  procedure :: expand_sub => prt_spec_list_expand_sub
<Particle specifiers: procedures>+≡
  recursive subroutine prt_spec_list_expand_sub (object)
    class(prt_spec_list_t), intent(inout) :: object
    integer :: i
    if (allocated (object%expr)) then
      do i = 1, size (object%expr)
        call object%expr(i)%expand ()
      end do
    end if
  end subroutine prt_spec_list_expand_sub

```

12.1.5 Sum

A sum of particle specifiers, indicating, e.g., a sum of final states.

```

<Particle specifiers: public>+≡
  public :: prt_spec_sum_t
<Particle specifiers: types>+≡
  type, extends (prt_spec_expr_t) :: prt_spec_sum_t
    type(prt_expr_t), dimension(:), allocatable :: expr
  contains
    <Particle specifiers: prt spec sum: TBP>
  end type prt_spec_sum_t

```

Output: Concatenate the components. Insert brackets if the component is a list or also a sum. The components of the `expr` array, if any, should all be filled.

```

<Particle specifiers: prt spec sum: TBP>≡
  procedure :: to_string => prt_spec_sum_to_string

```

(Particle specifiers: procedures)+≡

```

recursive function prt_spec_sum_to_string (object) result (string)
  class(prt_spec_sum_t), intent(in) :: object
  type(string_t) :: string
  integer :: i
  string = ""
  if (allocated (object%expr)) then
    do i = 1, size (object%expr)
      if (i > 1) string = string // " + "
      select type (x => object%expr(i)%x)
        type is (prt_spec_list_t)
          string = string // "(" // x%to_string () // ")"
        type is (prt_spec_sum_t)
          string = string // "(" // x%to_string () // ")"
        class default
          string = string // x%to_string ()
      end select
    end do
  end if
end function prt_spec_sum_to_string

```

Flatten: if there is a subexpression which is also a sum, include the components as direct members of the current sum.

This is identical to `prt_spec_list_flatten` above, except for the type.

(Particle specifiers: prt_spec_sum: TBP)+≡

```

procedure :: flatten => prt_spec_sum_flatten

```

(Particle specifiers: procedures)+≡

```

subroutine prt_spec_sum_flatten (object)
  class(prt_spec_sum_t), intent(inout) :: object
  type(prt_expr_t), dimension(:), allocatable :: tmp_expr
  integer :: i, n_flat, i_flat
  n_flat = 0
  do i = 1, size (object%expr)
    select type (y => object%expr(i)%x)
      type is (prt_spec_sum_t)
        n_flat = n_flat + size (y%expr)
      class default
        n_flat = n_flat + 1
    end select
  end do
  if (n_flat > size (object%expr)) then
    allocate (tmp_expr (n_flat))
    i_flat = 0
    do i = 1, size (object%expr)
      select type (y => object%expr(i)%x)
        type is (prt_spec_sum_t)
          tmp_expr (i_flat + 1 : i_flat + size (y%expr)) = y%expr
          i_flat = i_flat + size (y%expr)
        class default
          tmp_expr (i_flat + 1) = object%expr(i)
          i_flat = i_flat + 1
      end select
    end do
  end do

```

```

end if
if (allocated (tmp_expr)) &
    call move_alloc (from = tmp_expr, to = object%expr)
end subroutine prt_spec_sum_flatten

```

Apply `expand` to all terms in the sum.

```

⟨Particle specifiers: prt spec sum: TBP⟩+≡
    procedure :: expand_sub => prt_spec_sum_expand_sub

⟨Particle specifiers: procedures⟩+≡
    recursive subroutine prt_spec_sum_expand_sub (object)
        class(prt_spec_sum_t), intent(inout) :: object
        integer :: i
        if (allocated (object%expr)) then
            do i = 1, size (object%expr)
                call object%expr(i)%expand ()
            end do
        end if
    end subroutine prt_spec_sum_expand_sub

```

12.1.6 Expression Expansion

The `expand` method transforms each particle specifier expression into a sum of lists, according to the rules

$$a, (b, c) \rightarrow a, b, c \quad (12.1)$$

$$a + (b + c) \rightarrow a + b + c \quad (12.2)$$

$$a, b + c \rightarrow (a, b) + (a, c) \quad (12.3)$$

Note that the precedence of comma and plus are opposite to this expansion, so the parentheses in the final expression are necessary.

We assume that subexpressions are filled, i.e., arrays are allocated.

```

⟨Particle specifiers: prt expr: TBP⟩+≡
    procedure :: expand => prt_expr_expand

⟨Particle specifiers: procedures⟩+≡
    recursive subroutine prt_expr_expand (expr)
        class(prt_expr_t), intent(inout) :: expr
        if (allocated (expr%x)) then
            call distribute_prt_spec_list (expr%x)
            call expr%x%expand_sub ()
            select type (x => expr%x)
            type is (prt_spec_list_t)
                call x%flatten ()
            type is (prt_spec_sum_t)
                call x%flatten ()
            end select
        end if
    end subroutine prt_expr_expand

```

12.1.7 Test

This is the master for calling self-test procedures.

```
<Particle specifiers: public>+≡

12.2 PDG arrays

For defining aliases, we introduce a special type which holds a set of (integer) PDG codes.

```

⟨pdg_arrays.f90⟩≡
  ⟨File header⟩

  module pdg_arrays

    use io_units
    use unit_tests
    use sorting
    use physics_defs, only: UNDEFINED

    ⟨Standard module head⟩

    ⟨PDG arrays: public⟩

    ⟨PDG arrays: types⟩

    ⟨PDG arrays: interfaces⟩

    contains

    ⟨PDG arrays: procedures⟩

    ⟨PDG arrays: tests⟩

  end module pdg_arrays

```

12.2.1 Type definition

Using an allocatable array eliminates the need for initializer and/or finalizer.

```

⟨PDG arrays: public⟩≡
  public :: pdg_array_t

⟨PDG arrays: types⟩≡
  type :: pdg_array_t
    private
    integer, dimension(:), allocatable :: pdg
  contains
    ⟨PDG arrays: pdg array: TBP⟩
  end type pdg_array_t

```

Output

```

(PDG arrays: public)+≡
    public :: pdg_array_write

(PDG arrays: pdg array: TBP)≡
    procedure :: write => pdg_array_write

(PDG arrays: procedures)≡
    subroutine pdg_array_write (aval, unit)
        class(pdg_array_t), intent(in) :: aval
        integer, intent(in), optional :: unit

end function pdg_array_match_pdg_array

```

Comparison. Here, we take the PDG arrays as-is, assuming that they are sorted.

The ordering is a bit odd: first, we look only at the absolute values of the PDG codes. If they all match, the particle comes before the antiparticle, scanning from left to right.

12.2.5 PDG array list

A PDG array list, or PDG list, is an array of PDG-array objects with some convenience methods.

```
<PDG arrays: public>+≡
  public :: pdg_list_t

<PDG arrays: types>+≡
  type :: pdg_list_t
    type(pdg_array_t), dimension(:), allocatable :: a
    contains
    <PDG arrays: pdg list: TBP>
  end type pdg_list_t
```

Output, as a comma-separated list without advancing I/O.

```
<PDG arrays: pdg list: TBP>≡
  procedure :: write => pdg_list_write

<PDG arrays: procedures>+≡
  subroutine pdg_list_write (object, unit)
    class(pdg_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u, i
    u = given_output_unit (unit)
    if (allocated (object%a)) then
      do i = 1, size (object%a)
        if (i > 1) write (u, "(A)", advance="no") ", "
        call object%a(i)%write (u)
      end do
    end if
  end subroutine pdg_list_write
```

Initialize for a certain size. The entries are initially empty PDG arrays.

```
<PDG arrays: pdg list: TBP>+≡
  generic :: init => pdg_list_init_size
  procedure, private :: pdg_list_init_size

<PDG arrays: procedures>+≡
  subroutine pdg_list_init_size (pl, n)
    class(pdg_list_t), intent(out) :: pl
    integer, intent(in) :: n
    allocate (pl%a (n))
  end subroutine pdg_list_init_size
```

Initialize with a definite array of PDG codes. That is, each entry in the list becomes a single-particle PDG array.

```
<PDG arrays: pdg list: TBP>+≡
  generic :: init => pdg_list_init_int_array
  procedure, private :: pdg_list_init_int_array
```

```

(PDG arrays: procedures)+≡

```

Compare sorted lists. The result is undefined if some entries are not allocated.

The ordering is quite complicated. First, a shorter list comes before a longer list. Comparing entry by entry, a shorter entry comes first. Next, we check the first PDG code within corresponding entries. This is compared by absolute value. If equal, particle comes before antiparticle. Finally, if all is equal, the result is false.

```

12.3 Jets

The FastJet library is linked externally, if available. The wrapper code is also in a separate directory. Here, we define WHIZARD-specific procedures and tests.

```
<jets.f90>≡  
  <File header>  
  
  module jets  
  
    <Use kinds>  
    use unit_tests  
    use fastjet !NODEP!  
  
    <Standard module head>  
  
    <Jets: public>  
  
    contains  
  
    <Jets: procedures>  
  
    <Jets: tests>  
  
  end module jets
```

12.3.1 Re-exported symbols

We use this module as a proxy for the FastJet interface, therefore we re-export some symbols.

```
<Jets: public>≡  
  public :: fastjet_available  
  public :: fastjet_init  
  public :: jet_definition_t  
  public :: pseudojet_t  
  public :: pseudojet_vector_t  
  public :: cluster_sequence_t  
  public :: assignment (=)
```

The initialization routine prints the banner.

```
<Jets: procedures>≡  
  subroutine fastjet_init ()  
    call print_banner ()  
  end subroutine fastjet_init
```

The jet algorithm codes (actually, integers)

```
<Jets: public>+≡  
  public :: kt_algorithm  
  public :: cambridge_algorithm  
  public :: antikt_algorithm  
  public :: genkt_algorithm  
  public :: cambridge_for_passive_algorithm  
  public :: genkt_for_passive_algorithm
```

```

public :: ee_kt_algorithm
public :: ee_genkt_algorithm
public :: plugin_algorithm
public :: undefined_jet_algorithm

```

12.3.2 Unit tests

```

<Jets: public>+≡
    public :: jets_test

<Jets: procedures>+≡
    subroutine jets_test (u, results)
        integer, intent(in) :: u
        type (test_results_t), intent(inout) :: results
    <Jets: execute tests>
    end subroutine jets_test

```

This test is actually the minimal example from the FastJet manual, translated to Fortran.

Note that FastJet creates pseudojet vectors, which we mirror in the `pseudojet_vector_t`, but immediately assign to pseudojet arrays. Without automatic finalization available in the compilers, we should avoid this in actual code and rather introduce intermediate variables for those objects, which we can finalize explicitly.

```

<Jets: execute tests>≡
    call test (jets_1, "jets_1", &
        "basic FastJet functionality", &
        u, results)

```

12.4 subevents

The purpose of subevents is to store the relevant part of the physical event (either partonic or hadronic), and to hold particle selections and combinations which are constructed in cut or analysis expressions.

```
<subevents.f90>≡  
  <File header>  
  
  module subevents  
  
    use, intrinsic :: iso_c_binding !NODEP!  
  
    <Use kinds>  
    use io_units  
    use format_defs, only: FMT_14, FMT_19  
    use sorting  
    use c_particles  
    use lorentz  
    use pdg_arrays  
    use jets  
  
    <Standard module head>  
  
    <Subevents: public>  
  
    <Subevents: parameters>  
  
    <Subevents: types>  
  
    <Subevents: interfaces>  
  
    contains  
  
    <Subevents: procedures>  
  
  end module subevents
```

12.4.1 Particles

For the purpose of this module, a particle has a type which can indicate a beam, incoming, outgoing, or composite particle, flavor and helicity codes (integer, undefined for composite), four-momentum and invariant mass squared. (Other particles types are used in extended event types, but also defined here.) Furthermore, each particle has an allocatable array of ancestors – particle indices which indicate the building blocks of a composite particle. For an incoming/outgoing particle, the array contains only the index of the particle itself.

For incoming particles, the momentum is inverted before storing it in the particle object.

```
<Subevents: parameters>≡  
  integer, parameter, public :: PRT_UNDEFINED = 0  
  integer, parameter, public :: PRT_BEAM = -9  
  integer, parameter, public :: PRT_INCOMING = 1
```

```

integer, parameter, public :: PRT_OUTGOING = 2
integer, parameter, public :: PRT_COMPOSITE = 3
integer, parameter, public :: PRT_VIRTUAL = 4
integer, parameter, public :: PRT_RESONANT = 5
integer, parameter, public :: PRT_BEAM_REMNANT = 9

```

The type

We initialize only the type here and mark as unpolarized. The initializers below do the rest.

```

<Subevents: public>≡
  public :: prt_t

<Subevents: types>≡
  type :: prt_t
  private
    integer :: type = PRT_UNDEFINED
    integer :: pdg

        write (u, "('|'," // FMT_19 // ") ", advance="no") prt%p2
    end select
    if (allocated (prt%src)) then
        write (u, "('|'," // FMT_19 // ") ", advance="no")
        do i = 1, size (prt%src)
            write (u, "(1x,I0)", advance="no") prt%src(i)
        end do
    end if
    write (u, "(A)" // " ")
end subroutine prt_write

```

Tools

Two particles match if their `src` arrays are the same.

```

<Subevents: interfaces>+≡
    interface operator(.match.)
        module procedure prt_match
    end interface

<Subevents: procedures>+≡
    elemental function prt_match (prt1, prt2) result (match)
        logical :: match
        type(prt_t), intent(in) :: prt1, prt2
        if (size (prt1%src) == size (prt2%src)) then
            match = all (prt1%src == prt2%src)
        else
            match = .false.
        end if
    end function prt_match

```

The combine operation makes a pseudoparticle whose momentum is the result of adding (the momenta of) the pair of input particles. We trace the particles from which a particle is built by storing a `src` array. Each particle entry in the `src` list contains a list of indices which indicates its building blocks. The indices refer to an original list of particles. Index lists are sorted, and they contain no element more than once.

We thus require that in a given pseudoparticle, each original particle occurs at most once.

The result is `intent(inout)`, so it will not be initialized when the subroutine is entered.

```

<Subevents: procedures>+≡
    subroutine prt_combine (prt, prt_in1, prt_in2, ok)
        type(prt_t), intent(inout) :: prt
        type(prt_t), intent(in) :: prt_in1, prt_in2
        logical :: ok
        integer, dimension(:), allocatable :: src
        call combine_index_lists (src, prt_in1%src, prt_in2%src)
    end subroutine prt_combine

```

```

    ok = allocated (src)
    if (ok) call prt_init_composite (prt, prt_in1%p + prt_in2%p, src)
end subroutine prt_combine

```

This variant does not produce the combined particle, it just checks whether the combination is valid (no common src entry).

```

<Subevents: public>+≡
    public :: are_disjoint

<Subevents: procedures>+≡
    function are_disjoint (prt_in1, prt_in2) result (flag)
        logical :: flag
        type(prt_t), intent(in) :: prt_in1, prt_in2
        flag = index_lists_are_disjoint (prt_in1%src, prt_in2%src)
    end function are_disjoint

```

src Lists with length > 1 are built by a combine operation which merges the lists in a sorted manner. If the result would have a duplicate entry, it is discarded, and the result is unallocated.

```

<Subevents: procedures>+≡
    subroutine combine_index_lists (res, src1, src2)
        integer, dimension(:), intent(in) :: src1, src2
        integer, dimension(:), allocatable :: res
        integer :: i1, i2, i
        allocate (res (size (src1) + size (src2)))
        if (size (src1) == 0) then
            res = src2
            return
        else if (size (src2) == 0) then
            res = src1
            return
        end if
        i1 = 1
        i2 = 1
        LOOP: do i = 1, size (res)
            if (src1(i1) < src2(i2)) then
                res(i) = src1(i1); i1 = i1 + 1
                if (i1 > size (src1)) then
                    res(i+1:) = src2(i2:)
                    exit LOOP
                end if
            else if (src1(i1) > src2(i2)) then
                res(i) = src2(i2); i2 = i2 + 1
                if (i2 > size (src2)) then
                    res(i+1:) = src1(i1:)
                    exit LOOP
                end if
            else
                deallocate (res)
                exit LOOP
            end if
        end do LOOP
    end subroutine combine_index_lists

```

This function is similar, but it does not actually merge the list, it just checks whether they are disjoint (no common `src` entry).

(Subevents: procedures)+≡

```
function index_lists_are_disjoint (src1, src2) result (flag)
  logical :: flag
  integer, dimension(:), intent(in) :: src1, src2
  integer :: i1, i2, i
  flag = .true.
  i1 = 1
  i2 = 1
  LOOP: do i = 1, size (src1) + size (src2)
    if (src1(i1) < src2(i2)) then
      i1 = i1 + 1
      if (i1 > size (src1)) then
        exit LOOP
      end if
    else if (src1(i1) > src2(i2)) then
      i2 = i2 + 1
      if (i2 > size (src2)) then
        exit LOOP
      end if
    else
      flag = .false.
      exit LOOP
    end if
  end do LOOP
end function index_lists_are_disjoint
```

12.4.2 C-compatible particle type

12.4.3 subevents

Particles are collected in subevents. This type is implemented as a dynamically allocated array, which need not be completely filled. The value `n_active` determines the number of meaningful entries.

Type definition

(Subevents: public)+≡

```
public :: subevt_t
```

(Subevents: types)+≡

```
type :: subevt_t
  private
  integer :: n_active = 0
  type(prt_t), dimension(:), allocatable :: prt
contains
  (Subevents: subevt: TBP)
end type subevt_t
```

Initialize, allocating with size zero (default) or given size. The number of contained particles is set equal to the size.

```

<Subevents: public>+≡
    public :: subevt_init

<Subevents: procedures>+≡
    subroutine subevt_init (subevt, n_active)
        type(subevt_t), intent(out) :: subevt
        integer, intent(in), optional :: n_active
        if (present (n_active)) subevt%n_active = n_active
        allocate (subevt%prt (subevt%n_active))
    end subroutine subevt_init

```

(Re-)allocate the subevent with some given size. If the size is greater than the previous one, do a real reallocation. Otherwise, just reset the recorded size. Contents are untouched, but become invalid.

```

<Subevents: public>+≡
    public :: subevt_reset

<Subevents: procedures>+≡
    subroutine subevt_reset (subevt, n_active)
        type(subevt_t), intent(inout) :: subevt
        integer, intent(in) :: n_active
        subevt%n_active = n_active
        if (subevt%n_active > size (subevt%prt)) then
            deallocate (subevt%prt)
            allocate (subevt%prt (subevt%n_active))
        end if
    end subroutine subevt_reset

```

Output. No prefix for the headline 'subevt', because this will usually be printed appending to a previous line.

```

<Subevents: public>+≡
    public :: subevt_write

<Subevents: subevt: TBP>≡
    procedure :: write => subevt_write

<Subevents: procedures>+≡
    subroutine subevt_write (object, unit, prefix)
        class(subevt_t), intent(in) :: object
        integer, intent(in), optional :: unit
        character(*), intent(in), optional :: prefix
        integer :: u, i
        u = given_output_unit (unit); if (u < 0) return
        write (u, "(1x,A)") "subevent:"
        do i = 1, object%n_active
            if (present (prefix)) write (u, "(A)", advance="no") prefix
            write (u, "(1x,I0)", advance="no") i
            call prt_write (object%prt(i), unit)
        end do
    end subroutine subevt_write

```

Defined assignment: transfer only meaningful entries. This is a deep copy (as would be default assignment).

```

<Subevents: interfaces>+=
  interface assignment(=)
    module procedure subevt_assign
  end interface

<Subevents: procedures>+=
  subroutine subevt_assign (subevt, subevt_in)
    type(subevt_t), intent(inout) :: subevt
    type(subevt_t), intent(in) :: subevt_in
    if (.not. allocated (subevt%prt)) then
      call subevt_init (subevt, subevt_in%n_active)
    else
      call subevt_reset (subevt, subevt_in%n_active)
    end if
    subevt%prt(:subevt%n_active) = subevt_in%prt(:subevt%n_active)
  end subroutine subevt_assign

```

Fill contents

Store incoming/outgoing particles which are completely defined.

Operations with subevents

The join operation joins two subevents. When appending the elements of the second list, we check for each particle whether it is already in the first list. If yes, it is discarded. The result list should be initialized already.

If a mask is present, it refers to the second subevent. Particles where the mask is not set are discarded.

```

<Subevents: public>+≡
    public :: subevt_join

            end do
            flag = .true.
        end function disjoint
    end subroutine subevt_join

```

The combine operation makes a subevent whose entries are the result of adding (the momenta of) each pair of particles in the input lists. We trace the particles from which a particles is built by storing a `src` array. Each particle entry in the `src` list contains a list of indices which indicates its building blocks. The indices

refer to an original list of particles. Index lists are sorted, and they contain no element more than once.

We thus require that in a given pseudoparticle, each original particle occurs at most once.

```

<Subevents: public>+≡
    public :: subevt_combine

<Subevents: procedures>+≡
    subroutine subevt_combine (subevt, pl1, pl2, mask12)
        type(subevt_t), intent(inout) :: subevt
        type(subevt_t), intent(in) :: pl1, pl2
        logical, dimension(:,,:), intent(in), optional :: mask12
        integer :: n1, n2, i1, i2, n, j
        logical :: ok
        n1 = pl1%n_active
        n2 = pl2%n_active
        call subevt_reset (subevt, n1 * n2)
        n = 1
        do i1 = 1, n1
            do i2 = 1, n2
                if (present (mask12)) then
                    ok = mask12(i1,i2)
                else
                    ok = .true.
                end if
                if (ok) call prt_combine &
                    (subevt%prt(n), pl1%prt(i1), pl2%prt(i2), ok)
                if (ok) then
                    CHECK_DOUBLES: do j = 1, n - 1
                        if (subevt%prt(n) .match. subevt%prt(j)) then
                            ok = .false.; exit CHECK_DOUBLES
                        end if
                    end do CHECK_DOUBLES
                    if (ok) n = n + 1
                end if
            end do
        end do
        subevt%n_active = n - 1
    end subroutine subevt_combine

```

The collect operation makes a single-entry subevent which results from combining (the momenta of) all particles in the input list. As above, the result does not contain an original particle more than once; this is checked for each particle when it is collected. Furthermore, each entry has a mask; where the mask is false, the entry is dropped.

(Thus, if the input particles are already composite, there is some chance that the result depends on the order of the input list and is not as expected. This situation should be avoided.)

```

<Subevents: public>+≡
    public :: subevt_collect

<Subevents: procedures>+≡
    subroutine subevt_collect (subevt, pl1, mask1)

```

```

type(subevt_t), intent(inout) :: subevt
type(subevt_t), intent(in) :: pl1
logical, dimension(:), intent(in) :: mask1

call subevt_reset (subevt, 1)
subevt%n_active = 0
do i = 1, pl1%n_active
  if (mask1(i)) then
    if (subevt%n_active == 0) then
      subevt%n_active = 1
      subevt%prt(1) = pl1%prt(i)
    else
      call prt_combine (prt, subevt%prt(1), pl1%prt(i), ok)
      if (ok) subevt%prt(1) = prt
    end if
  end if
end do
end subroutine subevt_collect

```

The cluster operation is similar to `collect`, but applies a jet algorithm. The result is a subevent consisting of jets and, possibly, unclustered extra particles. As above, the result does not contain an original particle more than once; this is checked for each particle when it is collected. Furthermore, each entry has a mask; where the mask is false, the entry is dropped.

The algorithm: first determine the (pseudo)particles that participate in the clustering. They should not overlap, and the mask entry must be set. We then cluster the particles, using the given jet definition. The result particles are retrieved from the cluster sequence. We still have to determine the source indices for each jet: for each input particle, we get the jet index. Accumulating the source entries for all particles that are part of a given jet, we derive the jet source entries. Finally, we delete the C structures that have been constructed by FastJet and its interface.

```

```

12.4.4 Eliminate numerical noise

This is useful for testing purposes: set entries to zero that are smaller in absolute values than a given tolerance parameter.

Note: instead of setting the tolerance in terms of EPSILON (kind-dependent), we fix it to 10^{-16} , which is the typical value for double precision. The reason is that there are situations where intermediate representations (external libraries, files) are limited to double precision, even if the main program uses higher precision.

```

<Subevents: public>+≡

    do i = 1, subvt%n_active
      call pacify (subvt%prt(i))
    end do
  end subroutine pacify_subvt

```

12.5 Analysis tools

This module defines structures useful for data analysis. These include observables, histograms, and plots.

Observables are quantities that are calculated and summed up event by event. At the end, one can compute the average and error.

Histograms have their bins in addition to the observable properties. Histograms are usually written out in tables and displayed graphically.

In plots, each record creates its own entry in a table. This can be used for scatter plots if called event by event, or for plotting dependencies on parameters if called once per integration run.

Graphs are container for histograms and plots, which carry their own graphics options.

The type layout is still somewhat obfuscated. This would become much simpler if type extension could be used.

```
<analysis.f90>≡  
  <File header>  
  
  module analysis

    <Analysis: procedures>  
  
    <Analysis: tests>  
  
  end module analysis
```

12.5.1 Output formats

These formats share a common field width (alignment).

```
<Analysis: parameters>≡
    character(*), parameter, public :: HISTOGRAM_HEAD_FORMAT = "1x,A15,3x"
    character(*), parameter, public :: HISTOGRAM_INTG_FORMAT = "3x,I9,3x"
    character(*), parameter, public :: HISTOGRAM_DATA_FORMAT = "ES19.12"
```

12.5.2 Graph options

These parameters are used for displaying data. They apply to a whole graph, which may contain more than one plot element.

The GAMELAN code chunks are part of both `graph_options` and `drawing_options`. The `drawing_options` copy is used in histograms and plots, also as graph elements. The `graph_options` copy is used for `graph` objects as a whole. Both copies are usually identical.

```
<Analysis: public>≡
    public :: graph_options_t

obs%count = obs%count + 1
if (present (success)) success = .true.
end subroutine observable_record_value_weighted

```

Here are the statistics formulas:

1. Unweighted case: Given a sample of n values x_i , the average is

$$\langle x \rangle = \frac{\sum x_i}{n} \quad (12.4)$$

and the error estimate

$$\Delta x = \sqrt{\frac{1}{n-1} \langle \sum (x_i - \langle x \rangle)^2 \rangle} \quad (12.5)$$

$$= \sqrt{\frac{1}{n-1} \left(\frac{\sum x_i^2}{n} - \frac{(\sum x_i)^2}{n^2} \right)} \quad (12.6)$$

2. Weighted case: Instead of weight 1, each event comes with weight w_i .

$$\langle x \rangle = \frac{\sum x_i w_i}{\sum w_i} \quad (12.7)$$

and

$$\Delta x = \sqrt{\frac{1}{n-1} \left(\frac{\sum x_i^2 w_i}{\sum w_i} - \frac{(\sum x_i w_i)^2}{(\sum w_i)^2} \right)} \quad (12.8)$$

For $w_i = 1$, this specializes to the previous formula.

  if (present (drawing_options)) then
    p%drawing_options = drawing_options
  else
    call drawing_options_init_plot (p%drawing_options)
  end if
end subroutine plot_init_empty

```

Initialize a plot by copying another one, optionally merging in a new set of drawing options.

Since `p` has pointer (sub)components, we have to explicitly deep-copy the original.

<Analysis: procedures>+≡

```
subroutine plot_init_plot (p, p_in, drawing_options)
  type(plot_t), intent(out) :: p
  type(plot_t), intent(in) :: p_in
  type(drawing_options_t), intent(in), optional :: drawing_options
  type(point_t), pointer :: current, new
  current => p_in%first
  do while (associated (current))
    allocate (new)
    call point_init (new, current)
    if (associated (p%last)) then
      p%last%next => new
    else
      p%first => new
    end if
    p%last => new
    current => current%next
  end do
  p%count = p_in%count
  p%graph_options = p_in%graph_options
  if (present (drawing_options)) then
    p%drawing_options = drawing_options
  else
    p%drawing_options = p_in%drawing_options
  end if
end subroutine plot_init_plot
```

Finalize the plot by deallocating the list of points.

<Analysis: procedures>+≡

```
subroutine plot_final (plot)
  type(plot_t), intent(inout) :: plot
  type(point_t), pointer :: current
  do while (associated (plot%first))
    current => plot%first
    plot%first => current%next
    deallocate (current)
  end do
  plot%last => null ()
end subroutine plot_final
```

Fill plots

Clear the plot contents, but do not modify the structure.

<Analysis: procedures>+≡

```
subroutine plot_clear (plot)
  type(plot_t), intent(inout) :: plot
  plot%count = 0
  call plot_final (plot)
end subroutine plot_clear
```

Record a value. Successful if the value is within bounds, otherwise it is recorded as under-/overflow.

<Analysis: procedures>+≡

```
subroutine plot_record_value (plot, x, y, yerr, xerr, success)
  type(plot_t), intent(inout) :: plot
  real(default), intent(in) :: x, y
  real(default), intent(in), optional :: yerr, xerr
  logical, intent(out), optional :: success
  type(point_t), pointer :: point
  plot%count = plot%count + 1
  allocate (point)
  call point_init (point, x, y, yerr, xerr)
  if (associated (plot%first)) then
    plot%last%next => point
  else
    plot%first => point
  end if
  plot%last => point
  if (present (success)) success = .true.
end subroutine plot_record_value
```

Access contents

The number of points.

<Analysis: procedures>+≡

```
function plot_get_n_entries (plot) result (n)
  integer :: n
  type(plot_t), intent(in) :: plot
  n = plot%count
end function plot_get_n_entries
```

Return a pointer to the graph options.

<Analysis: procedures>+≡

```
function plot_get_graph_options_ptr (p) result (ptr)
  type(graph_options_t), pointer :: ptr
  type(plot_t), intent(in), target :: p
  ptr => p%graph_options
end function plot_get_graph_options_ptr
```

Return a pointer to the drawing options.

<Analysis: procedures>+≡

```
function plot_get_drawing_options_ptr (p) result (ptr)
  type(drawing_options_t), pointer :: ptr
  type(plot_t), intent(in), target :: p
  ptr => p%drawing_options
end function plot_get_drawing_options_ptr
```

Output

This output format is used by the GAMELAN driver below.

<Analysis: procedures>+≡

```
subroutine plot_write (plot, unit)
  type(plot_t), intent(in) :: plot
  integer, intent(in), optional :: unit
  type(point_t), pointer :: point
  integer :: u
  u = given_output_unit (unit); if (u < 0) return
  call point_write_header (u)
  point => plot%first
  do while (associated (point))
    call point_write (point, unit)
    point => point%next
  end do
  write (u, *)
  write (u, "(A,1x,A)" ) "#", "Summary:"
  write (u, "(A,1x,I0)" ) &
    "n_entries =", plot_get_n_entries (plot)
  write (u, *)
end subroutine plot_write
```

Write the GAMELAN reader for plot contents.

<Analysis: procedures>+≡

```

        c // "number of points: " &
        // int2char (plot_get_n_entries (plot)))
end subroutine plot_get_header

```

12.5.8 Graphs

A graph is a container for several graph elements. Each graph element is either a plot or a histogram. There is an appropriate base type below (the `analysis_object_t`), but to avoid recursion, we define a separate base type here. Note that there is no actual recursion: a graph is an analysis object, but a graph cannot contain graphs.

(If we could use type extension, the implementation would be much more transparent.)

Graph elements

Graph elements cannot be filled by the **record** command directly. The contents are always copied from elementary histograms or plots.

(Analysis: types)+≡

```
type :: graph_element_t
private
integer :: type = AN_UNDEFINED
type(histogram_t), pointer :: h => null ()
type(plot_t), pointer :: p => null ()
end type graph_element_t
```

(Analysis: procedures)+≡

```
subroutine graph_element_final (el)
type(graph_element_t), intent(inout) :: el
select case (el%type)
case (AN_HISTOGRAM)
deallocate (el%h)
case (AN_PLOT)
call plot_final (el%p)
deallocate (el%p)
end select
el%type = AN_UNDEFINED
end subroutine graph_element_final
```

Return the number of entries in the graph element:

(Analysis: procedures)+≡

```
function graph_element_get_n_entries (el) result (n)
integer :: n

end subroutine graph_element_write_gml_reader

```

The graph type

The actual graph type contains its own `graph_options`, which override the individual settings. The `drawing_options` are set in the graph elements. This distinction motivates the separation of the two types.

<Analysis: types>+≡

```

type :: graph_t
private
type(graph_element_t), dimension(:), allocatable :: el

```

```

    type(graph_options_t) :: graph_options
end type graph_t

```

Initializer/finalizer

The graph is created with a definite number of elements. The elements are filled one by one, optionally with modified drawing options.

(Analysis: procedures)+≡

```

subroutine graph_init (g, id, n_elements, graph_options)
    type(graph_t), intent(out) :: g
    type(string_t), intent(in) :: id
    integer, intent(in) :: n_elements
    type(graph_options_t), intent(in), optional :: graph_options
    allocate (g%el (n_elements))
    if (present (graph_options)) then
        g%graph_options = graph_options
    else
        call graph_options_init (g%graph_options)
    end if
    call graph_options_set (g%graph_options, id = id)
end subroutine graph_init

```

(Analysis: procedures)+≡

```

subroutine graph_insert_histogram (g, i, h, drawing_options)
    type(graph_t), intent(inout), target :: g

    end subroutine graph_insert_plot

```

Finalizer.

```

<Analysis: procedures>+≡
subroutine graph_final (g)
    type(graph_t), intent(inout) :: g
    integer :: i
    do i = 1, size (g%el)
        call graph_element_final (g%el(i))
    end do
    deallocate (g%el)
end subroutine graph_final

```

Access contents

The number of elements.

```

<Analysis: procedures>+≡
function graph_get_n_elements (graph) result (n)
    integer :: n
    type(graph_t), intent(in) :: graph
    n = size (graph%el)
end function graph_get_n_elements

```

Retrieve a pointer to the drawing options of an element, so they can be modified. (The `target` attribute is not actually needed because the components are pointers.)

```

<Analysis: procedures>+≡
function graph_get_drawing_options_ptr (g, i) result (ptr)
    type(drawing_options_t), pointer :: ptr
    type(graph_t), intent(in), target :: g
    integer, intent(in) :: i
    ptr => graph_element_get_drawing_options_ptr (g%el(i))
end function graph_get_drawing_options_ptr

```

Output

The default output format just writes histogram and plot data.

```

<Analysis: procedures>+≡
subroutine graph_write (graph, unit)
    type(graph_t), intent(in) :: graph
    integer, intent(in), optional :: unit
    integer :: i
    do i = 1, size (graph%el)
        call graph_element_write (graph%el(i), unit)
    end do

```

```
end subroutine graph_write
```

The GAMELAN driver is not a simple wrapper, but it writes the plot/histogram contents embedded the complete graph. First, data are read in, global background commands next, then individual elements, then global foreground commands.

<Analysis: procedures>+≡

12.5.10 Analysis object iterator

Analysis objects are containers which have iterable data structures: histograms/bins and plots/points. If they are to be treated on a common basis, it is useful to have an iterator which hides the implementation details.

The iterator is used only for elementary analysis objects that contain plot

data: histograms or plots. It is invalid for meta-objects (graphs) and non-graphical objects (observables).

```

<Analysis: public>+≡
    public :: analysis_iterator_t

<Analysis: types>+≡
    type :: analysis_iterator_t
    private
    integer :: type = AN_UNDEFINED
    type(analysis_object_t), pointer :: object => null ()
    integer :: index = 1
    type(point_t), pointer :: point => null ()
end type

```

The initializer places the iterator at the beginning of the analysis object.

```

<Analysis: procedures>+≡
    subroutine analysis_iterator_init (iterator, object)
    type(analysis_iterator_t), intent(out) :: iterator
    type(analysis_object_t), intent(in), target :: object
    iterator%object => object
    if (associated (iterator%object)) then
        iterator%type = iterator%object%type
        select case (iterator%type)
        case (AN_PLOT)
            iterator%point => iterator%object%p%first
        end select
    end if
end subroutine analysis_iterator_init

```

The iterator is valid as long as it points to an existing entry. An iterator for a data object without array data (observable) is always invalid.

```

<Analysis: public>+≡
    public :: analysis_iterator_is_valid

<Analysis: procedures>+≡
    function analysis_iterator_is_valid (iterator) result (valid)
    logical :: valid
    type(analysis_iterator_t), intent(in) :: iterator
    if (associated (iterator%object)) then
        select case (iterator%type)
        case (AN_HISTOGRAM)
            valid = iterator%index <= histogram_get_n_bins (iterator%object%h)
        case (AN_PLOT)
            valid = associated (iterator%point)
        case default
            valid = .false.
        end select
    else
        valid = .false.
    end if
end function analysis_iterator_is_valid

```

Advance the iterator.

```

<Analysis: public>+≡
    public :: analysis_iterator_advance

<Analysis: procedures>+≡
    subroutine analysis_iterator_advance (iterator)
        type(analysis_iterator_t), intent(inout) :: iterator
        if (associated (iterator%object)) then
            select case (iterator%type)
            case (AN_PLOT)
                iterator%point => iterator%point%next
            end select
            iterator%index = iterator%index + 1
        end if
    end subroutine analysis_iterator_advance

```

Retrieve the object type:

```

<Analysis: public>+≡
    public :: analysis_iterator_get_type

<Analysis: procedures>+≡
    function analysis_iterator_get_type (iterator) result (type)
        integer :: type
        type(analysis_iterator_t), intent(in) :: iterator
        type = iterator%type
    end function analysis_iterator_get_type

```

Use the iterator to retrieve data. We implement a common routine which takes the data descriptors as optional arguments. Data which do not occur in the selected type trigger to an error condition.

The iterator must point to a valid entry.

```

<Analysis: public>+≡
    public :: analysis_iterator_get_data

<Analysis: procedures>+≡
    subroutine analysis_iterator_get_data (iterator, &
        x, y, yerr, xerr, width, excess, index, n_total)
        type(analysis_iterator_t), intent(in) :: iterator
        real(default), intent(out), optional :: x, y, yerr, xerr, width, excess
        integer, intent(out), optional :: index, n_total
        select case (iterator%type)
        case (AN_HISTOGRAM)
            if (present (x)) &
                x = bin_get_midpoint (iterator%object%h%bin(iterator%index))
            if (present (y)) &

end subroutine analysis_iterator_get_data

```

12.5.11 Analysis store

This data structure holds all observables, histograms and such that are currently active. We have one global store; individual items are identified by their ID strings and types.

```

<Analysis: variables>≡
    type(analysis_store_t), save :: analysis_store

<Analysis: types>+≡
    type :: analysis_store_t
    private
        type(analysis_object_t), pointer :: first => null ()
        type(analysis_object_t), pointer :: last => null ()
    end type analysis_store_t

```

Delete the analysis store

```

<Analysis: public>+≡
    public :: analysis_final

```

```

<Analysis: procedures>+≡
subroutine analysis_final ()
  type(analysis_object_t), pointer :: current
  do while (associated (analysis_store%first))
    current => analysis_store%first
    analysis_store%first => current%next
    call analysis_object_final (current)
  end do
  analysis_store%last => null ()
end subroutine analysis_final

```

Append a new analysis object

```

<Analysis: procedures>+≡
subroutine analysis_store_append_object (id, type)
  type(string_t), intent(in) :: id
  integer, intent(in) :: type
  type(analysis_object_t), pointer :: obj
  allocate (obj)
  call analysis_object_init (obj, id, type)
  if (associated (analysis_store%last)) then
    analysis_store%last%next => obj
  else
    analysis_store%first => obj
  end if
  analysis_store%last => obj
end subroutine analysis_store_append_object

```

Return a pointer to the analysis object with given ID.

```

<Analysis: procedures>+≡
function analysis_store_get_object_ptr (id) result (obj)
  type(string_t), intent(in) :: id

            case default
                call msg_error ("Graph '" // char (id) // "': Element '" &
                    // char (id_in) // "' is neither histogram nor plot.")
        end select
    else
        call msg_error ("Graph '" // char (id) // "': Element '" &

```

```

        // char (id_in) // '' is undefined.")
    end if
end subroutine analysis_fill_graph

```

Retrieve generic results

Check if a named object exists.

```

<Analysis: public>+≡
    public :: analysis_exists

<Analysis: procedures>+≡
    function analysis_exists (id) result (flag)
        type(string_t), intent(in) :: id
        logical :: flag
        type(analysis_object_t), pointer :: obj
        flag = .true.
        obj => analysis_store%first
        do while (associated (obj))
            if (obj%id == id) return
            obj => obj%next
        end do
        flag = .false.
    end function analysis_exists

```

The following functions should work for all kinds of analysis object:

```

<Analysis: public>+≡
    public :: analysis_get_n_elements
    public :: analysis_get_n_entries
    public :: analysis_get_average
    public :: analysis_get_error

<Analysis: procedures>+≡

Chapter 13

Variables for Processes

This part introduces variables as user-controlled objects that influence the behavior of objects and calculations. Variables contain objects of intrinsic type or of a type as introduced above.

variables Store values of various kind, used by expressions and accessed by the command interface.

expr_base Expressions for evaluating parameters, using variables and variable lists. The module provides an abstract base type which requires an implementation.

13.1 Variables

The user interface deals with variables that are handled similarly to full-fledged programming languages. The system will add a lot of predefined variables (model parameters, flags, etc.) that are accessible to the user by the same methods.

Variables can be of various type: logical (boolean/flag), integer, real (default precision), subevents (used in cut expressions), arrays of PDG codes (aliases for particles), strings. Furthermore, in cut expressions we have unary and binary observables, which are used like real parameters but behave like functions.

```
<variables.f90>≡  
<File header>  
  
module variables  
  
  <Use kinds>  
  <Use strings>  
  use io_units  
  use format_utils, only: pac_fmt  
  use format_defs, only: FMT_14, FMT_19  
  use diagnostics  
  use lorentz  
  use pdg_arrays  
  use subevents
```

⟨Standard module head⟩

⟨Variables: public⟩

⟨Variables: parameters⟩

⟨Variables: types⟩

⟨Variables: interfaces⟩

contains

⟨Variables: procedures⟩

end module variables

13.1.1 Variable list entries

Variable (and constant) values can be of one of the following types:

```
⟨Variables: parameters⟩≡  
integer, parameter, public :: V_NONE = 0, V_LOG = 1, V_INT = 2, V_REAL = 3  
integer, parameter, public :: V_CMLX = 4, V_SEV = 5, V_PDG = 6, V_STR = 7  
integer, parameter, public :: V_OBS1_INT = 11, V_OBS2_INT = 12  
integer, parameter, public :: V_OBS1_REAL = 21, V_OBS2_REAL = 22  
integer, parameter, public :: V_UOBS1_INT = 31, V_UOBS2_INT = 32  
integer, parameter, public :: V_UOBS1_REAL = 41, V_UOBS2_REAL = 42
```

The type

This is an entry in the variable list. It can be of any type; in each case only one value is allocated. It may be physically allocated upon creation, in which case **is_allocated** is true, or it may contain just a pointer to a value somewhere else, in which case **is_allocated** is false.

The flag **is_defined** is set when the variable is given a value, even the undefined value. (Therefore it is distinct from **is_known**.) This matters for variable declaration in the SINDARIN language. The variable is set up in the compilation step and initially marked as defined, but after compilation all variables are set undefined. Each variable becomes defined when it is explicitly set. The difference matters in loops.

is_locked means that it cannot be given a value using the interface routines **var_list_set_XXX** below. It can only be initialized, or change automatically due to a side effect.

is_copy means that this is a local copy of a global variable. The copy has a pointer to the original, which can be used to restore a previous value.

is_intrinsic means that this variable is defined by the program, not by the user. Intrinsic variables cannot be (re)declared, but their values can be reset unless they are locked. **is_user_var** means that the variable has been declared by the user. It could be a new variable, or a local copy of an intrinsic variable.

The flag **is_known** is a pointer which parallels the use of the value pointer. For pointer variables, it is set if the value should point to a known value. For

ordinary variables, it should be true.

The value is implemented as a set of alternative type-specific pointers. This emulates polymorphism, and it allows for actual pointer variables. Observable-type variables have function pointers as values, so they behave like macros. The functions make use of the particle objects accessible via the pointers `p1` and `p2`.

Finally, the `next` pointer indicates that we are making lists of variables. A more efficient implementation might switch to hashes or similar; the current implementation has $O(N)$ lookup.

```

<Variables: public>≡
  public :: var_entry_t

      call var_entry_set_log (var, var_entry_get_lval (original), .true.)
    case (V_INT)
      call var_entry_set_int (var, var_entry_get_ival (original), .true.)
    case (V_REAL)
      call var_entry_set_real (var, var_entry_get_rval (original), .true.)
    case (V_CMPLX)
      call var_entry_set_cmplx (var, var_entry_get_cval (original), .true.)
    case (V_SEV)
      call var_entry_set_subevt (var, var_entry_get_pval (original), .true.)
    case (V_PDG)
      call var_entry_set_pdg_array (var, var_entry_get_aval (original), .true.)
    case (V_STR)
      call var_entry_set_string (var, var_entry_get_sval (original), .true.)
    end select
  else

```

```

        call var_entry_clear (var)
    end if
end subroutine var_entry_copy_value

```

Clear the pointer to the original.

```

<XXX Variables: procedures>+≡
subroutine var_entry_clear_original_pointer (var)
    type(var_entry_t), intent(inout) :: var
    var%original => null ()
end subroutine var_entry_clear_original_pointer

```

Set the pointer to the original. For a free parameter, the variable holds both the value and the pointer. For a derived parameter, we associate the pointer directly. Derived parameters thus need not be synchronized explicitly.

```

<XXX Variables: procedures>+≡
subroutine var_entry_set_original_pointer (var, original)
    type(var_entry_t), intent(inout) :: var
    type(var_entry_t), intent(in), target :: original
    if (var_entry_is_locked (original)) then
        call var_entry_lock (var)
    end if
    var%original => original
end subroutine var_entry_set_original_pointer

```

Synchronize a variable with its original: if a pointer exists, set the value to be equal to value pointed to.

```

<XXX Variables: procedures>+≡
subroutine var_entry_synchronize (var)
    type(var_entry_t), intent(inout) :: var
    if (associated (var%original)) then
        var%is_defined = var%original%is_defined
        var%is_known = var%original%is_known
        if (var%original%is_known) then
            select case (var%type)
            case (V_LOG); var%lval = var%original%lval
            case (V_INT); var%ival = var%original%ival
            case (V_REAL); var%rval = var%original%rval
            case (V_CMPLX); var%cval = var%original%cval
            case (V_SEV); var%pval = var%original%pval
            case (V_PDG); var%aval = var%original%aval
            case (V_STR); var%sval = var%original%sval
            end select
        end if
    end if
end subroutine var_entry_synchronize

```

Restore the previous value of the original, using the value stored in the variable. This is a side-effect operation.

```

<XXX Variables: procedures>+≡
subroutine var_entry_restore (var)
    type(var_entry_t), intent(inout) :: var

```

```

    if (associated (var%original)) then
      if (var%is_known) then
        select case (var%type)
          case (V_LOG);  var%original%lval = var%lval
          case (V_INT);  var%original%ival = var%ival
          case (V_REAL); var%original%rval = var%rval
          case (V_CMPLX); var%original%cval = var%cval
          case (V_SEV);  var%original%pval = var%pval
          case (V_PDG);  var%original%aval = var%aval
          case (V_STR);  var%original%sval = var%sval
        end select
      end if
    end if
  end subroutine var_entry_restore

```

13.1.4 Variable lists

The type

Variable lists can be linked together. No initializer needed. They are deleted separately.

```

<Variables: public>+≡
  public :: var_list_t

<Variables: types>+≡
  type :: var_list_t
  private
    type(var_entry_t), pointer :: first => null ()
    type(var_entry_t), pointer :: last => null ()
    type(var_list_t), pointer :: next => null ()
  end type var_list_t

```

Constructors

```

<Variables: public>+≡
  public :: var_list_link

<Variables: procedures>+≡
  subroutine var_list_link (var_list, next)
    type(var_list_t), intent(inout) :: var_list
    type(var_list_t), intent(in), target :: next
    var_list%next => next
  end subroutine var_list_link

```

Append a new entry to an existing list.

```

<Variables: procedures>+≡
  subroutine var_list_append (var_list, var, verbose)
    type(var_list_t), intent(inout) :: var_list
    type(var_entry_t), intent(in), target :: var
    logical, intent(in), optional :: verbose
    if (associated (var_list%last)) then

13.1.5 Tools

Return a pointer to the variable list linked to by the current one.

```

<Variables: public>+≡
    public :: var_list_get_next_ptr

<Variables: procedures>+≡
    function var_list_get_next_ptr (var_list) result (next_ptr)
        type(var_list_t), pointer :: next_ptr
        type(var_list_t), intent(in) :: var_list
        next_ptr => var_list%next
    end function var_list_get_next_ptr

```

Return a pointer to the variable with the requested name. If no such name exists, return a null pointer. In that case, try the next list if present, unless follow_link is unset. If defined is set, ignore entries that exist but are undefined.

```

```

Check for a valid value, given a pointer. Issue error messages if invalid.

```

<Variables: procedures>+≡
function var_has_value (var) result (valid)
    logical :: valid
    type(var_entry_t), pointer :: var
    if (associated (var)) then
        if (var%is_known) then
            valid = .true.
        else
            call msg_error ("The value of variable '" // char (var%name) &
                // "' is unknown but must be known at this point.")
            valid = .false.
        end if
    else
        call msg_error ("Variable '" // char (var%name) &
            // "' is undefined but must have a known value at this point.")
        valid = .false.
    end if
end function var_has_value

```

13.1.6 Process-specific variables

We allow the user to set a numeric process ID for each declared process.

```

<Variables: public>+≡
    public :: var_list_init_num_id

<Variables: procedures>+≡
    subroutine var_list_init_num_id (var_list, proc_id, num_id)
        type(var_list_t), intent(inout) :: var_list
        type(string_t), intent(in) :: proc_id
        integer, intent(in), optional :: num_id
        call var_list_set_procvar_int (var_list, proc_id, &
            var_str ("num_id"), num_id)
    end subroutine var_list_init_num_id

```

Integration results are stored in special variables. They are initialized by this subroutine. The values may or may not already known.

Note: the values which are accessible are those that are unique for a process with multiple MCI records. The rest has been discarded.

```

<Variables: public>+=
    public :: var_list_init_process_results

<Variables: procedures>+=
    subroutine var_list_init_process_results (var_list, proc_id, &

        end if
    end subroutine var_list_set_procvar_real

```

13.1.7 Observable initialization

Observables are formally treated as variables, which however are evaluated each time the observable is used. The arguments (pointers) to evaluate and the function are part of the variable-list entry.

The procedure pointer should be set by this subroutine. This, however, triggers a bug in nagfor 5.2(649). As a workaround, we return the variable pointer, so the pointer can be set directly.

```
(Variables: procedures)+≡
subroutine var_list_set_obs (var_list, name, type, var, prt1, prt2)
  type(var_list_t), intent(inout) :: var_list
  type(string_t), intent(in) :: name
  integer, intent(in) :: type
  type(var_entry_t), pointer :: var
  type(prt_t), intent(in), target :: prt1
  type(prt_t), intent(in), optional, target :: prt2
  allocate (var)
  call var_entry_init_obs (var, name, type, prt1, prt2)
  call var_list_append (var_list, var)
end subroutine var_list_set_obs
```

Unary and binary observables are different. Most unary observables can be equally well evaluated for particle pairs. Binary observables cannot be evaluated for single particles.

```

```

Check if a variable name is defined as an observable:

```

{Variables: procedures}+=
function string_is_observable_id (string) result (flag)
    logical :: flag
    type(string_t), intent(in) :: string
    select case (char (string))

```

```

    case ("PDG", "Hel", "M", "M2", "E", "Px", "Py", "Pz", "P", "Pl", "Pt", &
          "Theta", "Phi", "Rap", "Eta", "Theta_RF", "Dist", "kT")
        flag = .true.
    case default
        flag = .false.
    end select
end function string_is_observable_id

```

13.1.8 Observables

These are analogous to the unary and binary numeric functions listed above. An observable takes the `pval` component(s) of its one or two argument nodes and produces an integer or real value.

Integer-valued unary observables

The PDG code

```

<Variables: procedures>+≡
integer function obs_pdg1 (prt1) result (pdg)
    type(prt_t), intent(in) :: prt1
    pdg = prt_get_pdg (prt1)
end function obs_pdg1

```

The helicity. The return value is meaningful only if the particle is polarized, otherwise an invalid value is returned (-9).

```

<Variables: procedures>+≡
integer function obs_helicity1 (prt1) result (h)
    type(prt_t), intent(in) :: prt1
    if (prt_is_polarized (prt1)) then
        h = prt_get_helicity (prt1)
    else
        h = -9
    end if
end function obs_helicity1

```

Real-valued unary observables

The invariant mass squared, obtained from the separately stored value.

```

<Variables: procedures>+≡
real(default) function obs_mass_squared1 (prt1) result (p2)
    type(prt_t), intent(in) :: prt1
    p2 = prt_get_msq (prt1)
end function obs_mass_squared1

```

The signed invariant mass, which is the signed square root of the previous observable.

```

<Variables: procedures>+≡
real(default) function obs_signed_mass1 (prt1) result (m)
    type(prt_t), intent(in) :: prt1

```

```

    real(default) :: msq
    msq = prt_get_msq (prt1)
    m = sign (sqrt (abs (msq)), msq)
end function obs_signed_mass1

```

The particle energy

```

<Variables: procedures>+≡
real(default) function obs_energy1 (prt1) result (e)
    type(prt_t), intent(in) :: prt1
    e = energy (prt_get_momentum (prt1))
end function obs_energy1

```

Particle momentum (components)

```

<Variables: procedures>+≡
real(default) function obs_px1 (prt1) result (p)
    type(prt_t), intent(in) :: prt1
    p = vector4_get_component (prt_get_momentum (prt1), 1)
end function obs_px1

real(default) function obs_py1 (prt1) result (p)
    type(prt_t), intent(in) :: prt1
    p = vector4_get_component (prt_get_momentum (prt1), 2)
end function obs_py1

real(default) function obs_pz1 (prt1) result (p)
    type(prt_t), intent(in) :: prt1
    p = vector4_get_component (prt_get_momentum (prt1), 3)
end function obs_pz1

real(default) function obs_p1 (prt1) result (p)
    type(prt_t), intent(in) :: prt1
    p = space_part_norm (prt_get_momentum (prt1))
end function obs_p1

real(default) function obs_pl1 (prt1) result (p)
    type(prt_t), intent(in) :: prt1
    p = longitudinal_part (prt_get_momentum (prt1))
end function obs_pl1

real(default) function obs_pt1 (prt1) result (p)
    type(prt_t), intent(in) :: prt1
    p = transverse_part (prt_get_momentum (prt1))
end function obs_pt1

```

Polar and azimuthal angle (lab frame).

```

<Variables: procedures>+≡
real(default) function obs_theta1 (prt1) result (p)
    type(prt_t), intent(in) :: prt1
    p = polar_angle (prt_get_momentum (prt1))
end function obs_theta1

real(default) function obs_phi1 (prt1) result (p)

```

```

    type(prt_t), intent(in) :: prt1
    p = azimuthal_angle (prt_get_momentum (prt1))
end function obs_phi1

```

Rapidity and pseudorapidity

```

<Variables: procedures>+=
real(default) function obs_rap1 (prt1) result (p)
    type(prt_t), intent(in) :: prt1
    p = rapidity (prt_get_momentum (prt1))
end function obs_rap1

real(default) function obs_eta1 (prt1) result (p)
    type(prt_t), intent(in) :: prt1
    p = pseudorapidity (prt_get_momentum (prt1))
end function obs_eta1

```

Meaningless: Polar angle in the rest frame of the 2nd argument.

```

<Variables: procedures>+=
real(default) function obs_theta_rf1 (prt1) result (dist)
    type(prt_t), intent(in) :: prt1
    call msg_fatal (" 'Theta_RF' is undefined as unary observable")
    dist = 0
end function obs_theta_rf1

```

Meaningless: Distance on the η - ϕ cylinder.

```

<Variables: procedures>+=
real(default) function obs_dist1 (prt1) result (dist)
    type(prt_t), intent(in) :: prt1
    call msg_fatal (" 'Dist' is undefined as unary observable")
    dist = 0
end function obs_dist1

```

Integer-valued binary observables

These observables are meaningless as binary functions.

```

<Variables: procedures>+=
integer function obs_pdg2 (prt1, prt2) result (pdg)
    type(prt_t), intent(in) :: prt1, prt2
    call msg_fatal (" PDG_Code is undefined as binary observable")
    pdg = 0
end function obs_pdg2

integer function obs_helicity2 (prt1, prt2) result (h)
    type(prt_t), intent(in) :: prt1, prt2
    call msg_fatal (" Helicity is undefined as binary observable")
    h = 0
end function obs_helicity2

```

Real-valued binary observables

The invariant mass squared, obtained from the separately stored value.

```
(Variables: procedures)+≡  
  real(default) function obs_mass_squared2 (prt1, prt2) result (p2)  
    type(prt_t), intent(in) :: prt1, prt2  
    type(prt_t) :: prt  
    call prt_init_combine (prt, prt1, prt2)  
    p2 = prt_get_msq (prt)  
  end function obs_mass_squared2
```

The signed invariant mass, which is the signed square root of the previous observable.

```
(Variables: procedures)+≡  
  real(default) function obs_signed_mass2 (prt1, prt2) result (m)  
    type(prt_t), intent(in) :: prt1, prt2  
    type(prt_t) :: prt  
    real(default) :: msq  
    call prt_init_combine (prt, prt1, prt2)  
    msq = prt_get_msq (prt)  
    m = sign (sqrt (abs (msq)), msq)  
  end function obs_signed_mass2
```

The particle energy

```
(Variables: procedures)+≡  
  real(default) function obs_energy2 (prt1, prt2) result (e)  
    type(prt_t), intent(in) :: prt1, prt2  
    type(prt_t) :: prt  
    call prt_init_combine (prt, prt1, prt2)  
    e = energy (prt_get_momentum (prt))  
  end function obs_energy2
```

Particle momentum (components)

```
(Variables: procedures)+≡  
  real(default) function obs_px2 (prt1, prt2) result (p)  
    type(prt_t), intent(in) :: prt1, prt2  
    type(prt_t) :: prt  
    call prt_init_combine (prt, prt1, prt2)  
    p = vector4_get_component (prt_get_momentum (prt), 1)  
  end function obs_px2  
  
  real(default) function obs_py2 (prt1, prt2) result (p)  
    type(prt_t), intent(in) :: prt1, prt2  
    type(prt_t) :: prt  
    call prt_init_combine (prt, prt1, prt2)  
    p = vector4_get_component (prt_get_momentum (prt), 2)  
  end function obs_py2  
  
  real(default) function obs_pz2 (prt1, prt2) result (p)  
    type(prt_t), intent(in) :: prt1, prt2  
    type(prt_t) :: prt  
    call prt_init_combine (prt, prt1, prt2)
```

```

    p = vector4_get_component (prt_get_momentum (prt), 3)
end function obs_pz2

```

```

real(default) function obs_p2 (prt1, prt2) result (p)
    type(prt_t), intent(in) :: prt1, prt2
    type(prt_t) :: prt
    call prt_init_combine (prt, prt1, prt2)
    p = space_part_norm (prt_get_momentum (prt))
end function obs_p2

```

```

real(default) function obs_pl2 (prt1, prt2) result (p)
    type(prt_t), intent(in) :: prt1, prt2
    type(prt_t) :: prt
    call prt_init_combine (prt, prt1, prt2)
    p = longitudinal_part (prt_get_momentum (prt))
end function obs_pl2

```

```

real(default) function obs_pt2 (prt1, prt2) result (p)
    type(prt_t), intent(in) :: prt1, prt2
    type(prt_t) :: prt
    call prt_init_combine (prt, prt1, prt2)
    p = transverse_part (prt_get_momentum (prt))
end function obs_pt2

```

Enclosed angle and azimuthal distance (lab frame).

(Variables: procedures)+≡

```

real(default) function obs_theta2 (prt1, prt2) result (p)
    type(prt_t), intent(in) :: prt1, prt2
    p = enclosed_angle (prt_get_momentum (prt1), prt_get_momentum (prt2))
end function obs_theta2

```

```

real(default) function obs_phi2 (prt1, prt2) result (p)

```

13.1.9 API for variable lists

Set a new value. If the variable holds a pointer, this pointer is followed, e.g., a model parameter is actually set. If `ignore` is set, do nothing if the variable does not exist. If `verbose` is set, echo the new value.

The specific versions:

```
(Variables: public)+≡
public :: var_list_set_log
public :: var_list_set_int
public :: var_list_set_real
public :: var_list_set_cmplx
public :: var_list_set_subevt
public :: var_list_set_pdg_array
public :: var_list_set_string

(Variables: procedures)+≡

13.1.10 Linking model variables

The variable list of a model can be linked to the global variable list, so the model variables become available. However, the model may change during the execution of the command list, and this is not known at compile time. So, we

make a copy of all variables that can be modified by the user; this will include all variables that are present in any of the models. At runtime, the linked list and the pointers to it can be exchanged, but the global variables will stay.

Append a single model variable to the local variable list. The pointer to the original is not set (yet). Check first if it already exists; in that case, do nothing.

```

<XXX Variables: public>+=
    public :: var_list_init_copy

<XXX Variables: procedures>+=
    subroutine var_list_init_copy (var_list, model_var, user)
        type(var_list_t), intent(inout), target :: var_list
        type(var_entry_t), intent(in), target :: model_var
        logical, intent(in), optional :: user
        type(var_entry_t), pointer :: var
        if (.not. var_list_exists &
            (var_list, model_var%name, follow_link = .false.)) then
            allocate (var)
            call var_entry_init_copy (var, model_var, user)
            call var_list_append (var_list, var)
        end if
    end subroutine var_list_init_copy

```

Append all model variables, or reuse (unset) them if they already exist. If `derived_only` is set, copy only derived parameters; these are real parameters that are locked. How should we (should we at all?) generalize this to complex parameters?

```

<XXX Variables: public>+=
    public :: var_list_init_copies

<XXX Variables: procedures>+=
    subroutine var_list_init_copies (var_list, model_vars, derived_only)
        type(var_list_t), intent(inout), target :: var_list
        type(var_list_t), intent(in) :: model_vars
        logical, intent(in), optional :: derived_only
        type(var_entry_t), pointer :: model_var, var
        type(string_t) :: name
        logical :: copy_all, locked, derived
        integer :: type
        copy_all = .true.
        if (present (derived_only)) copy_all = .not. derived_only
        model_var => model_vars%first
        do while (associated (model_var))
            name = var_entry_get_name (model_var)
            type = var_entry_get_type (model_var)
            locked = var_entry_is_locked (model_var)
            derived = type == V_REAL .and. locked
            if (copy_all .or. derived) then
                var => var_list_get_var_ptr &
                    (var_list, name, type, follow_link = .false.)
                if (associated (var)) then
                    call var_entry_clear_value (var)
                else
                    allocate (var)
                    call var_entry_init_copy (var, model_var)
                end if
            end if
            model_var => model_var%next
        end do
    end subroutine var_list_init_copies

```

```

        call var_list_append (var_list, var)
    end if
end if
    model_var => model_var%next
end do
end subroutine var_list_init_copies

```

Clear all previously allocated pointers to some model:

```

<XXX Variables: procedures>+≡
subroutine var_list_clear_original_pointers (var_list)
    type(var_list_t), intent(inout) :: var_list
    type(var_entry_t), pointer :: var
    var => var_list%first
    do while (associated (var))
        call var_entry_clear_original_pointer (var)
        var => var%next
    end do
end subroutine var_list_clear_original_pointers

```

Assign the pointer to the original for a single variable.

```

<XXX Variables: public>+≡
    public :: var_list_set_original_pointer

<XXX Variables: procedures>+≡
subroutine var_list_set_original_pointer (var_list, name, model_vars)
    type(var_list_t), intent(inout) :: var_list
    type(string_t), intent(in) :: name
    type(var_list_t), intent(in), target :: model_vars
    type(var_entry_t), pointer :: var, model_var
    integer :: type
    model_var => var_list_get_var_ptr (model_vars, name)
    if (associated (model_var)) then
        type = var_entry_get_type (model_var)
        var => var_list_get_var_ptr (var_list, name, type, follow_link=.false.)
        if (associated (var)) then
            call var_entry_set_original_pointer (var, model_var)
        end if
    end if
end subroutine var_list_set_original_pointer

```

Assign pointers to the originals for all variables in the model variable list.

```

<XXX Variables: public>+≡
    public :: var_list_set_original_pointers

<XXX Variables: procedures>+≡
subroutine var_list_set_original_pointers (var_list, model_vars)
    type(var_list_t), intent(inout) :: var_list
    type(var_list_t), intent(in), target :: model_vars
    type(var_entry_t), pointer :: var, model_var
    type(string_t) :: name
    integer :: type
    model_var => model_vars%first
    do while (associated (model_var))

```

```

        name = var_entry_get_name (model_var)
        type = var_entry_get_type (model_var)
        var => var_list_get_var_ptr (var_list, name, type, follow_link=.false.)
        if (associated (var)) then
            call var_entry_set_original_pointer (var, model_var)
        end if
        model_var => model_var%next
    end do
end subroutine var_list_set_original_pointers

```

Synchronize the local variable list with the model variable list (which is accessed by the pointers assigned in the previous subroutine).

If `reset_pointers` is unset, do not reset pointers but just update values where a variable is a copy. Resetting pointers is done only in the local variable list.

```

<XXX Variables: public>+≡
    public :: var_list_synchronize

<XXX Variables: procedures>+≡
    subroutine var_list_synchronize (var_list, model_vars, reset_pointers)
        type(var_list_t), intent(inout) :: var_list
        type(var_list_t), intent(in), target :: model_vars
        logical, intent(in), optional :: reset_pointers
        type(var_entry_t), pointer :: var
        if (present (reset_pointers)) then
            if (reset_pointers) then
                call var_list_clear_original_pointers (var_list)
                call var_list_set_original_pointers (var_list, model_vars)
            end if
        end if
        var => var_list%first
        do while (associated (var))
            call var_entry_synchronize (var)
            var => var%next
        end do
    end subroutine var_list_synchronize

```

This is the inverse operation: synchronize the model variable list with the current variable list. This is necessary after discarding a local variable list.

For accessing all model variables, we should follow the links first, then scan the current list.

```

<XXX Variables: public>+≡
    public :: var_list_restore

<XXX Variables: procedures>+≡
    recursive subroutine var_list_restore (var_list, follow_link)
        type(var_list_t), intent(inout) :: var_list
        type(var_entry_t), pointer :: var
        logical, intent(in), optional :: follow_link
        logical :: rec
        rec = .true.; if (present (follow_link)) rec = follow_link
        if (rec .and. associated (var_list%next)) then
            call var_list_restore (var_list%next, rec)

```

```

end if
var => var_list%first
do while (associated (var))
    call var_entry_restore (var)
    var => var%next
end do
end subroutine var_list_restore

```

Import values for the current variable list from another list.

```

<Variables: public>+≡
    public :: var_list_import

<Variables: procedures>+≡
    subroutine var_list_import (var_list, src_list)
        type(var_list_t), intent(inout) :: var_list
        type(var_list_t), intent(in) :: src_list
        type(var_entry_t), pointer :: var, src
        type(string_t) :: name
        var => var_list%first
        do while (associated (var))
            src => var_list_get_var_ptr (src_list, var%name)
            if (associated (src)) then
                call var_entry_copy_value (var, src)
            end if
            var => var%next
        end do
    end subroutine var_list_import

```

Mark all entries in the current variable list as undefined. This is done when a local variable list is discarded. If the local list is used again (by a loop), the entries will be re-initialized.

```

<Variables: public>+≡
    public :: var_list_undefine

<Variables: procedures>+≡
    recursive subroutine var_list_undefine (var_list, follow_link)

  logical :: flag
  type(string_t), intent(in) :: string
  type(string_t) :: buffer, name, separator
  buffer = string
  call split (buffer, name, "(", separator=separator) ! ")"
  if (separator == "(") then
    select case (char (name))
    case ("num_id")
      flag = .true.
    case default
      flag = .false.
    end select
  else

```

```

        flag = .false.
    end if
end function string_is_num_id

```

13.2 Abstract Expressions

Expressions are objects that can be initialized once and evaluated many times, yielding values of various type. The expressions use and rely on variables.

In this module, all types are abstract. The implementation (or several of them) have to be provided in some other module. However, the applications can use the abstract type without depending on the implementation modules.

Unit tests are deferred to implementations.

```

⟨expr_base.f90⟩≡
  ⟨File header⟩

  module expr_base

    ⟨Use kinds⟩
    ⟨Use strings⟩
    use parser
    use subevents
    use variables

    ⟨Standard module head⟩

    ⟨Expr base: public⟩

    ⟨Expr base: types⟩

    ⟨Expr base: interfaces⟩

    contains

    ⟨Expr base: procedures⟩

  end module expr_base

```

13.2.1 Abstract expression type

The abstract type is empty. All data are provided by the implementation.

```

⟨Expr base: public⟩≡
  public :: expr_t

⟨Expr base: types⟩≡
  type, abstract :: expr_t
    contains
    ⟨Expr base: expr: TBP⟩
  end type expr_t

```

Finalizer (if needed)

```
<Expr base: expr: TBP>≡  
  procedure(expr_final), deferred :: final  
  
<Expr base: interfaces>≡  
  abstract interface  
    subroutine expr_final (expr)  
      import  
      class(expr_t), intent(inout) :: expr  
    end subroutine expr_final  
  end interface
```

Output

```
<Expr base: expr: TBP>+≡  
  procedure(expr_write), deferred :: write  
  
<Expr base: interfaces>+≡  
  abstract interface  
    subroutine expr_write (expr, unit, write_var_list)  
      import  
      class(expr_t), intent(in) :: expr  
      integer, intent(in), optional :: unit  
      logical, intent(in), optional :: write_var_list  
    end subroutine expr_write  
  end interface
```

Configure the expression for a specific result type. The expression should evaluate to a logical (real), respectively. We take a variable list and a subevt as input. Other input may already be stored in the expression object, therefore intent(inout).

```
<Expr base: expr: TBP>+≡  
  procedure(expr_setup_expr), deferred :: setup_expr  
  procedure(expr_setup_expr), deferred :: setup_lexpr  
  
<Expr base: interfaces>+≡  
  abstract interface  
    subroutine expr_setup_expr (expr, var_list, subevt)  
      import  
      class(expr_t), intent(inout), target :: expr  
      type(var_list_t), intent(in), target :: var_list  
      type(subevt_t), intent(in), optional, target :: subevt  
    end subroutine expr_setup_expr  
  end interface
```

Evaluate. We can assume that all data are inside the object (partly via pointer), so no extra arguments.

```
<Expr base: expr: TBP>+≡  
  procedure(expr_evaluate), deferred :: evaluate  
  
<Expr base: interfaces>+≡  
  abstract interface  
    subroutine expr_evaluate (expr)  
      import
```

```

        class(expr_t), intent(inout) :: expr
    end subroutine expr_evaluate
end interface

```

Get results. First, check if it is actually defined:

```

<Expr base: expr: TBP>+≡
    procedure(expr_is_known), deferred :: is_known
<Expr base: interfaces>+≡
    abstract interface
        function expr_is_known (expr) result (flag)
            import
            class(expr_t), intent(in) :: expr
            logical :: flag
        end function expr_is_known
    end interface

```

Get value.

```

<Expr base: expr: TBP>+≡
    procedure(expr_get_log), deferred :: get_log
    procedure(expr_get_real), deferred :: get_real
<Expr base: interfaces>+≡
    abstract interface
        function expr_get_log (expr) result (lval)
            import
            class(expr_t), intent(in) :: expr
            logical :: lval
        end function expr_get_log
    end interface

    abstract interface
        function expr_get_real (expr) result (rval)
            import
            class(expr_t), intent(in) :: expr
            real(default) :: rval
        end function expr_get_real
    end interface

```

13.2.2 Abstract factory type

This abstract type enables us to defer the allocation of a specific expression type. Each implementation has a build method that will allocate an expression with matching type.

```

<Expr base: public>+≡
    public :: expr_factory_t
<Expr base: types>+≡
    type, abstract :: expr_factory_t
    contains
    <Expr base: expr factory: TBP>
end type expr_factory_t

```

Output.

```
<Expr base: expr factory: TBP>≡
  procedure(expr_factory_write), deferred :: write
<Expr base: interfaces>+≡
  abstract interface
    subroutine expr_factory_write (expr_factory, unit)
      import
      class(expr_factory_t), intent(in) :: expr_factory
      integer, intent(in), optional :: unit
    end subroutine expr_factory_write
  end interface
```

Build method.

```
<Expr base: expr factory: TBP>+≡
  procedure(expr_factory_build), deferred :: build
<Expr base: interfaces>+≡
  abstract interface
    subroutine expr_factory_build (expr_factory, expr)
      import
      class(expr_factory_t), intent(in) :: expr_factory
      class(expr_t), intent(out), allocatable :: expr
    end subroutine expr_factory_build
  end interface
```

Chapter 14

Matrix Element Handling

In this chapter, we support internal and external matrix elements: initialization, automatic generation where necessary, and numerical evaluation. We provide the interface for code generation and linking. Matrix-element code is organized in processes and process libraries.

process_constants A record of static process properties, for easy transfer between various WHIZARD modules.

prclib_interfaces This module deals with matrix-element code which is accessible via external libraries (Fortran libraries or generic C-compatible libraries) and must either be generated by the program or provided by the user explicitly.

The module defines and uses an abstract type `prc_writer_t` and two abstract extensions, one for a Fortran module and one for a C-compatible library. The implementation provides the specific methods for writing the appropriate parts in external matrix element code.

prc_core_def This module defines the abstract types `prc_core_def_t` and `prc_driver_t`. The implementation of the former provides the configuration for processes of a certain class, while the latter accesses the corresponding matrix element, in particular those generated by the appropriate `prc_writer_t` object.

process_libraries This module combines the functionality of the previous module with the means for holding processes definitions (the internal counterpart of appropriate declarations in the user interface), for handling matrix elements which do not need external code, and for accessing the matrix elements by the procedures for matrix-element evaluation, integration and event generation.

prclib_stacks Collect process libraries.

test_me This module provides a test implementation for the abstract types in the `prc_core_def` module. The implementation is intended for self-tests of several later modules. The implementation is internal, i.e., no external code has is generated.

All data structures which are specific for a particular way of generating code or evaluating matrix element are kept abstract and thus generic. Later modules such as `prc_omega` provide implementations, in the form of type extensions for the various abstract types.

14.1 Process data block

We define a simple transparent type that contains universal constant process data. We will reference objects of this type for the phase-space setup, for interfacing with process libraries, for implementing matrix-element generation, and in the master process-handling module.

```
<process_constants.f90>≡  
  <File header>
```

```
  module process_constants
```

```
    <Use kinds>
```

```
    <Use strings>
```

```
    <Standard module head>
```

```
    <Process constants: public>
```

```
    <Process constants: types>
```

```
  contains
```

```
    <Process constants: procedures>
```

```
  end module process_constants
```

The data type is just a block of public objects, only elementary types, no type-bound procedures.

```
<Process constants: public>≡
```

```
  public :: process_constants_t
```

```
<Process constants: types>≡
```

```
  type :: process_constants_t
```

```
    type(string_t) :: id
```

```
    type(string_t) :: model_name
```

```
    character(32) :: md5sum = ""
```

```
    logical :: openmp_supported = .false.
```

```
    integer :: n_in = 0
```

```
    integer :: n_out = 0
```

```
    integer :: n_flv = 0
```

```
    integer :: n_hel = 0
```

```
    integer :: n_col = 0
```

```
    integer :: n_cin = 0
```

```
    integer :: n_cf = 0
```

```
    integer, dimension(:,:), allocatable :: flv_state
```

```
    integer, dimension(:,:), allocatable :: hel_state

```

14.2 Process library interface

The module `prclib_interfaces` handles external matrix-element code.

14.2.1 Overview

The top-level data structure is the `prclib_driver_t` data type. The associated type-bound procedures deal with the generation of external code, compilation and linking, and accessing the active external library.

An object of type `prclib_driver_t` consists of the following parts:

1. Metadata that identify name and status of the library driver, etc.
2. An array of process records (`prclib_driver_record_t`), one for each external matrix element.
3. A record of type `dlaccess_t` which handles the operating-system part of linking a dynamically loadable library.
4. A collection of procedure pointers which have a counterpart in the external library interface. Given the unique identifier of a matrix element, the procedures retrieve generic matrix-element information such as the particle content and helicity combination tables. There is also a procedure which returns pointers to the more specific procedures that a matrix element provides, called *features*.

The process records of type `prclib_driver_record_t` handle the individual matrix elements. Each record identifies a process by name (`id`), names the physics model to be loaded for this process, lists the features that the associated matrix-element code provides, and holds a `writer` object which handles all operations that depend on the process type. The numbering of process records is identical to the numbering of matrix-element codes in the external library.

The writer object is of abstract type `prc_writer_t`. The module defines two basic, also abstract, extensions: `prc_writer_f_module_t` and `prc_writer_c_lib_t`. The first version is for matrix-element code that is available in form of Fortran modules. The writer contains type-bound procedures which create appropriate `use` directives and C-compatible wrapper functions for the given set of Fortran modules and their features. The second version is for matrix-element code that is available in form of a C-compatible library (this includes Fortran libraries with proper C bindings). The writer needs not write wrapper function, but explicit interface blocks for the matrix-element features.

Each matrix-element variant is encoded in an appropriate extension of `prc_writer_t`. For instance, `O'MEGA` matrix elements provide an implementation `omega_writer_t` which extends `prc_writer_f_module_t`.

14.2.2 Workflow

We expect that the functionality provided by this module is called in the following order:

1. The caller initializes the `prclib_driver_t` object and fills the array of `prclib_record_t` entries with the appropriate process data and process-specific writer objects.
2. It calls the `generate_makefile` method to set up an appropriate makefile in the current directory. The makefile will handle source generation, compilation and linking both for the individual matrix elements (unless this has to be done manually) and for the common external driver code which interfaces those matrix element.
3. The `generate_driver_code` writes the common driver as source code to file.
4. The methods `make_source`, `make_compile`, and `make_link` individually perform the corresponding steps in building the library. Wherever possible, they simply use the generated makefile. By calling `make`, we make sure that we can avoid unnecessary recompilation. For the compilation and linking steps, the makefile will employ `libtool`.
5. The `load` method loads the library procedures into the corresponding procedure pointers, using the `dlopen` mechanism via the `dlaccess` subobject.

14.2.3 The module

```
<prclib_interfaces.f90>≡  
<File header>  
  
module prclib_interfaces  
  
    use, intrinsic :: iso_c_binding !NODEP!  
  
    use kinds  
<Use strings>  
    use io_units  
    use unit_tests  
    use system_defs, only: TAB  
    use diagnostics  
    use os_interface  
  
<Standard module head>

<Prclib interfaces: test types>
```

```

contains

<Prclib interfaces: procedures>

<Prclib interfaces: tests>

end module prclib_interfaces

```

14.2.4 Writers

External matrix element code provides externally visible procedures, which we denote as *features*. The features consist of informational subroutines and functions which are mandatory (universal features) and matrix-element specific subroutines and functions (specific features). The driver interfaces the generic features directly, while it returns the specific features in form of bind(C) procedure pointers to the caller. For instance, function `n_in` is generic, while the matrix matrix-element value itself is specific.

To implement these tasks, the driver needs `use` directives for Fortran module procedures, interface blocks for other external stuff, wrapper code, and Makefile snippets.

Generic writer

In the `prc_writer_t` data type, we collect the procedures which implement the writing tasks. The type is abstract. The concrete implementations are defined by an extension which is specific for the process type.

The MD5 sum stored here should be the MD5 checksum of the current process component, which can be calculated once the process is configured completely. It can be used by implementations which work with external files, such as O'MEGA.

```

<Prclib interfaces: public>≡
    public :: prc_writer_t

<Prclib interfaces: types>≡
    type, abstract :: prc_writer_t
        character(32) :: md5sum = ""
    contains
    <Prclib interfaces: prc writer: TBP>
    end type prc_writer_t

```

In any case, it is useful to have a string representation of the writer type. This must be implemented by all extensions.

```

<Prclib interfaces: prc writer: TBP>≡
    procedure(get_const_string), nopass, deferred :: type_name

<Prclib interfaces: interfaces>≡
    abstract interface
        function get_const_string () result (string)
            import
            type(string_t) :: string
        end function get_const_string
    end interface

```

Return the name of a procedure that implements a given feature, as it is provided by the external matrix-element code. For a reasonable default, we take the feature name unchanged.

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure, nopass :: get_procname => prc_writer_get_procname

<Prclib interfaces: procedures>≡
  function prc_writer_get_procname (feature) result (name)
    type(string_t) :: name
    type(string_t), intent(in) :: feature
    name = feature
  end function prc_writer_get_procname

```

Return the name of a procedure that implements a given feature with the bind(C) property, so it can be accessed via a C procedure pointer and handled by dlopen. We need this for all special features of a matrix element, since the interface has to return a C function pointer for it. For a default implementation, we prefix the external procedure name by the process ID.

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure :: get_c_procname => prc_writer_get_c_procname

<Prclib interfaces: procedures>+≡
  function prc_writer_get_c_procname (writer, id, feature) result (name)
    class(prc_writer_t), intent(in) :: writer
    type(string_t), intent(in) :: id, feature
    type(string_t) :: name
    name = id // "_" // feature
  end function prc_writer_get_c_procname

```

Common signature of code-writing procedures. The procedure may use the process ID, and the feature name. (Not necessarily all of them.)

```

<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine write_code_file (writer, id)
      import
      class(prc_writer_t), intent(in) :: writer
      type(string_t), intent(in) :: id
    end subroutine write_code_file
  end interface

  abstract interface
    subroutine write_code (writer, unit, id)
      import
      class(prc_writer_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
    end subroutine write_code
  end interface

  abstract interface
    subroutine write_code_os (writer, unit, id, os_data, testflag)
      import
      class(prc_writer_t), intent(in) :: writer

```

```

        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
        type(os_data_t), intent(in) :: os_data
        logical, intent(in), optional :: testflag
    end subroutine write_code_os
end interface

abstract interface
    subroutine write_feature_code (writer, unit, id, feature)
        import
        class(prc_writer_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id, feature
    end subroutine write_feature_code
end interface

```

There must be a procedure which writes an interface block for a given feature. If the external matrix element is implemented as a Fortran module, this is required only for the specific features which are returned as procedure pointers.

```

<Prclib interfaces: prc writer: TBP>+≡
    procedure(write_feature_code), deferred :: write_interface

```

There must also be a procedure which writes Makefile code which is specific for the current process, but not the feature.

```

<Prclib interfaces: prc writer: TBP>+≡
    procedure(write_code_os), deferred :: write_makefile_code

```

This procedure writes code process-specific source-code file (which need not be Fortran). It may be a no-op, if the source code is generated by Make instead.

```

<Prclib interfaces: prc writer: TBP>+≡
    procedure(write_code_file), deferred :: write_source_code

```

Writer for Fortran-module matrix elements

If the matrix element is available as a Fortran module, we have specific requirements: (i) the features are imported via `use` directives, (ii) the specific features require `bind(C)` wrappers.

The type is still abstract, all methods must be implemented explicitly for a specific matrix-element variant.

```

<Prclib interfaces: public>+≡
    public :: prc_writer_f_module_t

<Prclib interfaces: types>+≡
    type, extends (prc_writer_t), abstract :: prc_writer_f_module_t
    contains
    <Prclib interfaces: prc writer f module: TBP>
    end type prc_writer_f_module_t

```

Return the name of the Fortran module. As a default implementation, we take the process ID unchanged.

```

<Prclib interfaces: prc writer f module: TBP>≡
    procedure, nopass :: get_module_name => prc_writer_get_module_name

```

```

<Prclib interfaces: procedures>+≡
function prc_writer_get_module_name (id) result (name)
  type(string_t) :: name
  type(string_t), intent(in) :: id
  name = id
end function prc_writer_get_module_name

```

Write a `use` directive that associates the driver reference with the procedure in the matrix element code. By default, we use the C name for this.

```

<Prclib interfaces: prc writer f module: TBP>+≡
  procedure :: write_use_line => prc_writer_write_use_line

<Prclib interfaces: procedures>+≡
subroutine prc_writer_write_use_line (writer, unit, id, feature)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t) :: id, feature
  write (unit, "(2x,9A)") "use ", char (writer%get_module_name (id)), &
    ", only: ", char (writer%get_c_procname (id, feature)), &
    " => ", char (writer%get_procname (feature))
end subroutine prc_writer_write_use_line

```

Write a wrapper routine for a feature. This also associates a C name the module procedure. The details depend on the writer variant.

```

<Prclib interfaces: prc writer f module: TBP>+≡
  procedure(prc_write_wrapper), deferred :: write_wrapper

<Prclib interfaces: interfaces>+≡
abstract interface
  subroutine prc_write_wrapper (writer, unit, id, feature)
    import
    class(prc_writer_f_module_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id, feature
  end subroutine prc_write_wrapper
end interface

```

This is used for testing only: initialize the writer with a specific MD5 sum string.

```

<Prclib interfaces: prc writer: TBP>+≡
  procedure :: init_test => prc_writer_init_test

<Prclib interfaces: procedures>+≡
subroutine prc_writer_init_test (writer)
  class(prc_writer_t), intent(out) :: writer
  writer%md5sum = "1234567890abcdef1234567890abcdef"
end subroutine prc_writer_init_test

```

Writer for C-library matrix elements

This applies if the matrix element is available as a C library or a Fortran library with `bind(C)` compatible interface. We can use the basic version.

The type is still abstract, all methods must be implemented explicitly for a specific matrix-element variant.

```

<Prclib interfaces: types>+≡
  type, extends (prc_writer_t), abstract :: prc_writer_c_lib_t
  contains
  <Prclib interfaces: prc writer c lib: TBP>
end type prc_writer_c_lib_t

```

14.2.5 Process records in the library driver

A process record holds the process (component) ID, the physics `model_name`, and the array of `features` that are implemented by the corresponding matrix element code.

The `writer` component holds procedures. The procedures write source code for the current record, either for the driver or for the Makefile.

```

<Prclib interfaces: types>+≡
  type :: prclib_driver_record_t
    type(string_t) :: id
    type(string_t) :: model_name
    type(string_t), dimension(:), allocatable :: feature
    class(prc_writer_t), pointer :: writer => null ()
  contains
  <Prclib interfaces: prclib driver record: TBP>
end type prclib_driver_record_t

```

Output routine. We indent the output, so it smoothly integrates into the output routine for the whole driver.

Note: the pointer `writer` is introduced as a workaround for a NAG compiler bug.

```

<Prclib interfaces: prclib driver record: TBP>≡
  procedure :: write => prclib_driver_record_write

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_record_write (object, unit)
    class(prclib_driver_record_t), intent(in) :: object
    integer, intent(in) :: unit
    integer :: j
    class(prc_writer_t), pointer :: writer
    write (unit, "(3x,A,2x,['',A,']')") &
      char (object%id), char (object%model_name)
    if (allocated (object%feature)) then
      writer => object%writer
      write (unit, "(5x,A,A)", advance="no") &
        char (writer%type_name ()), ":"
      do j = 1, size (object%feature)
        write (unit, "(1x,A)", advance="no") &
          char (object%feature(j))
      end do
      write (unit, *)
    end if
  end subroutine prclib_driver_record_write

```

Get the C procedure name for a feature.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: get_c_procname => prclib_driver_record_get_c_procname

<Prclib interfaces: procedures>+≡
  function prclib_driver_record_get_c_procname (record, feature) result (name)
    type(string_t) :: name
    class(prclib_driver_record_t), intent(in) :: record
    type(string_t), intent(in) :: feature
    name = record%writer%get_c_procname (record%id, feature)
  end function prclib_driver_record_get_c_procname

```

Write a USE directive for a given feature. Applies only if the record corresponds to a Fortran module.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: write_use_line => prclib_driver_record_write_use_line

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_record_write_use_line (record, unit, feature)
    class(prclib_driver_record_t), intent(in) :: record
    integer, intent(in) :: unit
    type(string_t), intent(in) :: feature
    select type (writer => record%writer)
      class is (prc_writer_f_module_t)
        call writer%write_use_line (unit, record%id, feature)
    end select
  end subroutine prclib_driver_record_write_use_line

```

The alternative: write an interface block for a given feature, unless the record corresponds to a Fortran module.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: write_interface => prclib_driver_record_write_interface

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_record_write_interface (record, unit, feature)
    class(prclib_driver_record_t), intent(in) :: record
    integer, intent(in) :: unit
    type(string_t), intent(in) :: feature
    select type (writer => record%writer)
      class is (prc_writer_f_module_t)
        class default
          call writer%write_interface (unit, record%id, feature)
        end select
    end select
  end subroutine prclib_driver_record_write_interface

```

Write all special feature interfaces for the current record. Do this for all process variants.

```

<Prclib interfaces: prclib driver record: TBP>+≡
  procedure :: write_interfaces => prclib_driver_record_write_interfaces

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_record_write_interfaces (record, unit)
    class(prclib_driver_record_t), intent(in) :: record
    integer, intent(in) :: unit

```

```

integer :: i
do i = 1, size (record%feature)
    call record%writer%write_interface (unit, record%id, record%feature(i))
end do
end subroutine prclib_driver_record_write_interfaces

```

Write the wrapper routines for this record, if it corresponds to a Fortran module.

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_wrappers => prclib_driver_record_write_wrappers
<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_record_write_wrappers (record, unit)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        integer :: i
        select type (writer => record%writer)
        class is (prc_writer_f_module_t)
            do i = 1, size (record%feature)
                call writer%write_wrapper (unit, record%id, record%feature(i))
            end do
        end select
    end subroutine prclib_driver_record_write_wrappers

```

Write the Makefile code for this record.

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_makefile_code => prclib_driver_record_write_makefile_code
<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_record_write_makefile_code &
        (record, unit, os_data, testflag)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        type(os_data_t), intent(in) :: os_data
        logical, intent(in), optional :: testflag
        call record%writer%write_makefile_code (unit, record%id, os_data, testflag)
    end subroutine prclib_driver_record_write_makefile_code

```

Write source-code files for this record. (Does nothing if the source code is handled by Makefile rules.)

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_source_code => prclib_driver_record_write_source_code
<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_record_write_source_code (record)
        class(prclib_driver_record_t), intent(in) :: record
        call record%writer%write_source_code (record%id)
    end subroutine prclib_driver_record_write_source_code

```

14.2.6 The process library driver object

A `prclib_driver_t` object provides the interface to external matrix element code. The code is provided by an external library which is either statically or dynamically linked.

The dynamic and static versions of the library are two different implementations of the abstract base type.

The **basename** identifies the library, both by file names and by Fortran variable names.

The **loaded** flag becomes true once all procedure pointers to the matrix element have been assigned.

For a dynamical external library, the communication proceeds via a **dlaccess** object.

n_processes is the number of external process code components that are referenced by this library. The code is addressed by index (**i_lib** in the process library entry above). This number should be equal to the number returned by **get_n_prc**.

For each external process, there is a separate **record** which holds the data that are needed for the driver parts which are specific for a given process component. The actual pointers for the loaded library will be assigned elsewhere.

The remainder is a collection of procedure pointers, which can be assigned once all external code has been compiled and linked. The procedure pointers all take a process component code index as an argument. Most return information about the process component that should match the process definition. The **get_fptr** procedures return a function pointer, which is the actual means to compute matrix elements or retrieve associated data.

Finally, the **unload_hook** and **reload_hook** pointers allow for the insertion of additional code when a library is loaded.

  write (unit, "(1x,A)") "Matrix-element code entries: [undefined]"
end if
end subroutine prclib_driver_write

```

Allocate a library as either static or dynamic. For static libraries, the procedure defers control to an external procedure which knows about the available static libraries. By default, this procedure is empty, but when we build a stand-alone executable, we replace the dummy by an actual dispatcher for the available static libraries. If the static dispatcher was not successful, we allocate a dynamic library.

The default version of `dispatch_prclib_static` resides in the `prebuilt` section of the `WHIZARD` tree, in a separate library. It does nothing, but can be replaced by a different procedure that allocates a static library driver if requested by name.

Note: `intent(out)` for the `driver` argument segfaults with gfortran 4.7.

```

<Prclib interfaces: public>+≡
  public :: dispatch_prclib_driver

14.2.8 Write driver file

This procedure writes the process library driver source code to the specified output unit. The individual routines for writing source-code procedures are given below.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: generate_driver_code => prclib_driver_generate_code

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_generate_code (driver, unit)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t) :: prefix
    integer :: i

    prefix = driver%basename // "_"

    write (unit, "(A)") "! WHIZARD matrix-element code interface"
    write (unit, "(A)") "!"
    write (unit, "(A)") "! Automatically generated file, do not edit"
    call driver%write_module (unit, prefix)
    call driver%write_lib_md5sum_fun (unit, prefix)
    call driver%write_get_n_processes_fun (unit, prefix)
    call driver%write_get_process_id_fun (unit, prefix)
    call driver%write_get_model_name_fun (unit, prefix)
    call driver%write_get_md5sum_fun (unit, prefix)
    call driver%write_string_to_array_fun (unit, prefix)
    call driver%write_get_omp_status_fun (unit, prefix)
    call driver%write_get_int_fun (unit, prefix, var_str ("n_in"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_out"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_flv"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_hel"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_col"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_cin"))
    call driver%write_get_int_fun (unit, prefix, var_str ("n_cf"))
    call driver%write_set_int_sub (unit, prefix, var_str ("flv_state"))
    call driver%write_set_int_sub (unit, prefix, var_str ("hel_state"))
    call driver%write_set_col_state_sub (unit, prefix)
    call driver%write_set_color_factors_sub (unit, prefix)
    call driver%write_get_fptr_sub (unit, prefix)
    do i = 1, driver%n_processes

```

```

        call driver%record(i)%write_wrappers (unit)
    end do
end subroutine prclib_driver_generate_code

```

The driver module is used and required *only* if we intend to link the library statically. Then, it provides the (static) driver type as a concrete implementation of the abstract library driver. This type contains the internal dispatcher for assigning the library procedures to their appropriate procedure pointers. In the dynamical case, the assignment is done via the base-type dispatcher which invokes the DL mechanism.

However, compiling this together with the rest in any case should not do any harm.

```

<Prclib interfaces: prclib driver: TBP>+≡
    procedure, nopass :: write_module => prclib_driver_write_module

<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_write_module (unit, prefix)
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix
        write (unit, "(A)") ""
        write (unit, "(A)") "! Module: define library driver as an extension &
            &of the abstract driver type."
        write (unit, "(A)") "! This is used _only_ by the library dispatcher &
            &of a static executable."
        write (unit, "(A)") "! For a dynamical library, the stand-alone proce&
            &dures are linked via libdl."
        write (unit, "(A)") ""

  end subroutine prclib_driver_write_lib_md5sum_fun

```

14.2.9 Interface bodies for informational functions

These interfaces implement the communication between WHIZARD (the main program) and the process-library driver. The procedures are all BIND(C), so they can safely be exposed by the library and handled by the `dlopen` mechanism, which apparently understands only C calling conventions.

In the sections below, for each procedure, we provide both the interface itself and a procedure that writes the corresponding procedure as source code to the process library driver.

Process count

Return the number of processes contained in the library.

```

<Prclib interfaces: public>+≡
  public :: prc_get_n_processes

<Prclib interfaces: interfaces>+≡
  abstract interface
    function prc_get_n_processes () result (n) bind(C)
      import
      integer(c_int) :: n
    end function prc_get_n_processes
  end interface

```

Here is the code.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_get_n_processes_fun

<Prclib interfaces: procedures>+≡
  subroutine write_get_n_processes_fun (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    write (unit, "(A)") ""
    write (unit, "(A)") "! Return the number of processes in this library"
    write (unit, "(A)") "function " // char (prefix) &
      // "get_n_processes () result (n) bind(C)"
    write (unit, "(A)") "  use iso_c_binding"
    write (unit, "(A)") "  implicit none"
    write (unit, "(A)") "  integer(c_int) :: n"
    write (unit, "(A,I0)") "  n = ", driver%n_processes
    write (unit, "(A)") "end function " // char (prefix) &
      // "get_n_processes"
  end subroutine write_get_n_processes_fun

```

Informational string functions

These functions return constant information about the matrix-element code.

The following procedures have to return strings. With the BIND(C) constraint, we choose to return the C pointer to a string, and its length, so the procedures implement this interface. They are actually subroutines.

```

<Prclib interfaces: public>+≡
  public :: prc_get_stringptr

<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine prc_get_stringptr (i, cptr, len) bind(C)
      import
      integer(c_int), intent(in) :: i
      type(c_ptr), intent(out) :: cptr
      integer(c_int), intent(out) :: len
    end subroutine prc_get_stringptr
  end interface

```

To hide this complication, we introduce a subroutine that converts the returned C pointer to a `string_t` object. As a side effect, we deallocate the original after conversion – otherwise, we might have a memory leak.

For the conversion, we first pointer-convert the C pointer to a Fortran character array pointer, length 1 and size `len`. Using argument association and an internal subroutine, we convert this to a character array with length `len` and size 1. Using ordinary assignment, we finally convert this to `string_t`.

The function takes the pointer-returning function as an argument. The index `i` identifies the process in the library.

```

<Prclib interfaces: procedures>+≡
  subroutine get_string_via_cptr (string, i, get_stringptr)
    type(string_t), intent(out) :: string
    integer, intent(in) :: i

```

```

procedure(prc_get_stringptr) :: get_stringptr
type(c_ptr) :: cptr
integer(c_int) :: pid, len
character(kind=c_char), dimension(:), pointer :: c_array
pid = i
call get_stringptr (pid, cptr, len)
if (c_associated (cptr)) then
    call c_f_pointer (cptr, c_array, shape = [len])
    call set_string (c_array)
    call get_stringptr (0_c_int, cptr, len)
else
    string = ""
end if
contains
subroutine set_string (buffer)
    character(len, kind=c_char), dimension(1), intent(in) :: buffer
    string = buffer(1)
end subroutine set_string
end subroutine get_string_via_cptr

```

Since the module procedures return Fortran strings, we have to convert them. This is the necessary auxiliary routine. The routine is not BIND(C), it is not accessed from outside.

```

<Prclib interfaces: prclib driver: TBP>+≡
    procedure, nopass :: write_string_to_array_fun

<Prclib interfaces: procedures>+≡
subroutine write_string_to_array_fun (unit, prefix)
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    write (unit, "(A)") ""
    write (unit, "(A)") "! Auxiliary: convert character string &
        &to array pointer"
    write (unit, "(A)") "subroutine " // char (prefix) &
        // "string_to_array (string, a)"
    write (unit, "(A)") " use iso_c_binding"
    write (unit, "(A)") " implicit none"
    write (unit, "(A)") " character(*), intent(in) :: string"
    write (unit, "(A)") " character(kind=c_char), dimension(:), &
        &allocatable, intent(out) :: a"
    write (unit, "(A)") " integer :: i"
    write (unit, "(A)") " allocate (a (len (string)))"
    write (unit, "(A)") " do i = 1, size (a)"
    write (unit, "(A)") "     a(i) = string(i:i)"
    write (unit, "(A)") " end do"
    write (unit, "(A)") "end subroutine " // char (prefix) &
        // "string_to_array"
end subroutine write_string_to_array_fun

```

The above routine is called by other functions. It is not in a module, so they need its interface explicitly.

```

<Prclib interfaces: procedures>+≡
    subroutine write_string_to_array_interface (unit, prefix)

```

```

integer, intent(in) :: unit
type(string_t), intent(in) :: prefix
write (unit, "(2x,A)") "interface"
write (unit, "(2x,A)") "  subroutine " // char (prefix) &
  // "string_to_array (string, a)"
write (unit, "(2x,A)") "    use iso_c_binding"
write (unit, "(2x,A)") "    implicit none"
write (unit, "(2x,A)") "    character(*), intent(in) :: string"
write (unit, "(2x,A)") "    character(kind=c_char), dimension(:), &
  &allocatable, intent(out) :: a"
write (unit, "(2x,A)") "  end subroutine " // char (prefix) &
  // "string_to_array"
write (unit, "(2x,A)") "end interface"
end subroutine write_string_to_array_interface

```

Here are the info functions which return strings, implementing the interface `prc_get_stringptr`.

Return the process ID for each process.

<Prclib interfaces: prclib driver: TBP>+≡

```

procedure :: write_get_process_id_fun

```

<Prclib interfaces: procedures>+≡

```

subroutine write_get_process_id_fun (driver, unit, prefix)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: unit
  type(string_t), intent(in) :: prefix
  integer :: i
  write (unit, "(A)") ""
  write (unit, "(A)") "! Return the process ID of process #i &
    &(as a C pointer to a character array)"
  write (unit, "(A)") "subroutine " // char (prefix) &

    &target, save :: md5sum"
  write (unit, "(A)") " select case (i)"
  write (unit, "(A)") " case (0)"
  write (unit, "(A)") " call copy (" // char (prefix) // "md5sum ())"
  write (unit, "(A)") " cptr = c_loc (md5sum)"
  do i = 1, driver%n_processes
    write (unit, "(A,I0,A)") " case (" , i, ")"
    call driver%record(i)%write_md5sum_call (unit)
  end do
  write (unit, "(A)") " case default"
  write (unit, "(A)") " cptr = c_null_ptr"
  write (unit, "(A)") " end select"
  write (unit, "(A)") " len = 32"
  write (unit, "(A)") "contains"
  write (unit, "(A)") " subroutine copy (md5sum_tmp)"
  write (unit, "(A)") " character, dimension(32), intent(in) :: &
    &md5sum_tmp"
  write (unit, "(A)") " md5sum = md5sum_tmp"
  write (unit, "(A)") " end subroutine copy"
  write (unit, "(A)") "end subroutine " // char (prefix) &
    // "get_md5sum_ptr"
end subroutine write_get_md5sum_fun

```

The actual call depends on the type of matrix element.

<Prclib interfaces: prclib driver record: TBP>+≡

```

procedure :: write_md5sum_call => prclib_driver_record_write_md5sum_call

```

<Prclib interfaces: procedures>+≡

```

subroutine prclib_driver_record_write_md5sum_call (record, unit)
  class(prclib_driver_record_t), intent(in) :: record
  integer, intent(in) :: unit

```

```

        call record%writer%write_md5sum_call (unit, record%id)
    end subroutine prclib_driver_record_write_md5sum_call

```

The interface goes into the writer base type:

```

<Prclib interfaces: prc writer: TBP>+≡

```

```

    procedure(write_code), deferred :: write_md5sum_call

```

In the Fortran module case, we take a detour. The string returned by the Fortran function is copied into a fixed-size array. The copy routine is an internal subroutine of `get_md5sum_ptr`. We return the C address of the target array.

```

<Prclib interfaces: prc writer f module: TBP>+≡

```

```

    procedure :: write_md5sum_call => prc_writer_f_module_write_md5sum_call

```

```

<Prclib interfaces: procedures>+≡

```

```

    subroutine prc_writer_f_module_write_md5sum_call (writer, unit, id)
        class(prc_writer_f_module_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
        write (unit, "(5x,9A)") "call copy (" , &
            char (writer%get_c_procname (id, var_str ("md5sum"))), " ()"
        write (unit, "(5x,9A)") "cptr = c_loc (md5sum)"
    end subroutine prc_writer_f_module_write_md5sum_call

```

In the C library case, the library function returns a C pointer, which we can just copy.

```

<Prclib interfaces: prc writer c lib: TBP>≡

```

```

    procedure :: write_md5sum_call => prc_writer_c_lib_write_md5sum_call

```

```

<Prclib interfaces: procedures>+≡

```

```

    subroutine prc_writer_c_lib_write_md5sum_call (writer, unit, id)
        class(prc_writer_c_lib_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
        write (unit, "(5x,9A)") &
            "cptr = ", &
            char (writer%get_c_procname (id, var_str ("get_md5sum"))), " ()"
    end subroutine prc_writer_c_lib_write_md5sum_call

```

Actual references to the info functions

The string-valued info functions return C character arrays. For the API of the library driver, we provide convenience functions which (re)convert those arrays into `string_t` objects.

```

<Prclib interfaces: prclib driver: TBP>+≡

```

```

    procedure :: get_process_id => prclib_driver_get_process_id
    procedure :: get_model_name => prclib_driver_get_model_name
    procedure :: get_md5sum => prclib_driver_get_md5sum

```

```

<Prclib interfaces: procedures>+≡

```

```

    function prclib_driver_get_process_id (driver, i) result (string)
        type(string_t) :: string
        class(prclib_driver_t), intent(in) :: driver

```

```

integer, intent(in) :: i
call get_string_via_cptr (string, i, driver%get_process_id_ptr)
end function prclib_driver_get_process_id

function prclib_driver_get_model_name (driver, i) result (string)
type(string_t) :: string
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: i
call get_string_via_cptr (string, i, driver%get_model_name_ptr)
end function prclib_driver_get_model_name

function prclib_driver_get_md5sum (driver, i) result (string)
type(string_t) :: string
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: i
call get_string_via_cptr (string, i, driver%get_md5sum_ptr)
end function prclib_driver_get_md5sum

```

Informational logical functions

When returning a logical value, we use the C boolean type, which may differ from Fortran.

```

<Prclib interfaces: public>+≡
public :: prc_get_log

<Prclib interfaces: interfaces>+≡
abstract interface
function prc_get_log (pid) result (l) bind(C)
import
integer(c_int), intent(in) :: pid
logical(c_bool) :: l
end function prc_get_log
end interface

```

Return a logical flag which tells whether OpenMP is supported for a specific process code.

```

<Prclib interfaces: prclib driver: TBP>+≡
procedure :: write_get_openmp_status_fun

<Prclib interfaces: procedures>+≡
subroutine write_get_openmp_status_fun (driver, unit, prefix)
class(prclib_driver_t), intent(in) :: driver
integer, intent(in) :: unit
type(string_t), intent(in) :: prefix
integer :: i
write (unit, "(A)") ""
write (unit, "(A)") "! Return the OpenMP support status"
write (unit, "(A)") "function " // char (prefix) &
// "get_openmp_status (i) result (openmp_status) bind(C)"
write (unit, "(A)") " use iso_c_binding"
call driver%write_interfaces (unit, var_str ("openmp_supported"))
write (unit, "(A)") " integer(c_int), intent(in) :: i"
write (unit, "(A)") " logical(c_bool) :: openmp_status"
write (unit, "(A)") " select case (i)"

```

```

do i = 1, driver%n_processes
  write (unit, "(A,I0,9A)" " case (" , i, " "); " , &
    "openmp_status = " , &
    char (driver%record(i)%get_c_procname &
      (var_str ("openmp_supported"))), " ()"
end do
write (unit, "(A)" " end select"
write (unit, "(A)" "end function " // char (prefix) &
  // "get_openmp_status"
end subroutine write_get_openmp_status_fun

```

Informational integer functions

Various process metadata are integer values. We can use a single interface for all of them.

```

<Prclib interfaces: public>+≡
  public :: prc_get_int

<Prclib interfaces: interfaces>+≡
  abstract interface
    function prc_get_int (pid) result (n) bind(C)
      import
      integer(c_int), intent(in) :: pid
      integer(c_int) :: n
    end function prc_get_int
  end interface

```

This function returns any data of type integer, for each process.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_get_int_fun

<Prclib interfaces: procedures>+≡
  subroutine write_get_int_fun (driver, unit, prefix, feature)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    type(string_t), intent(in) :: feature
    integer :: i
    write (unit, "(A)" ""
    write (unit, "(9A)" " ! Return the value of " , char (feature)
    write (unit, "(9A)" "function " , char (prefix), &
      "get_" , char (feature), " (pid)", &
      " result (" , char (feature), ") bind(C)"
    write (unit, "(9A)" " use iso_c_binding"
    call driver%write_interfaces (unit, feature)
    write (unit, "(9A)" " integer(c_int), intent(in) :: pid"
    write (unit, "(9A)" " integer(c_int) :: " , char (feature)
    write (unit, "(9A)" " select case (pid)"
    do i = 1, driver%n_processes
      write (unit, "(2x,A,I0,9A)" "case (" , i, " "); " , &
        char (feature), " = " , &
        char (driver%record(i)%get_c_procname (feature)), &
        " ()"
    end do

```

```

        write (unit, "(9A)") " end select"
        write (unit, "(9A)") "end function ", char (prefix), &
            "get_", char (feature)
    end subroutine write_get_int_fun

```

Write a case line that assigns the value of the external function to the current return value.

```

<Prclib interfaces: procedures>+≡
    subroutine write_case_int_fun (record, unit, i, feature)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        integer, intent(in) :: i
        type(string_t), intent(in) :: feature
        write (unit, "(5x,A,I0,9A)") "case (" , i, ")"; " , &
            char (feature), " = ", char (record%get_c_procname (feature))
    end subroutine write_case_int_fun

```

Flavor and helicity tables

Transferring tables is more complicated. First, a two-dimensional array.

```

<Prclib interfaces: public>+≡
    public :: prc_set_int_tab1

<Prclib interfaces: interfaces>+≡
    abstract interface
        subroutine prc_set_int_tab1 (pid, tab, shape) bind(C)
            import
            integer(c_int), intent(in) :: pid
            integer(c_int), dimension(*), intent(out) :: tab
            integer(c_int), dimension(2), intent(in) :: shape
        end subroutine prc_set_int_tab1
    end interface

```

This subroutine returns a table of integers.

```

<Prclib interfaces: prclib driver: TBP>+≡
    procedure :: write_set_int_sub

<Prclib interfaces: procedures>+≡
    subroutine write_set_int_sub (driver, unit, prefix, feature)
        class(prclib_driver_t), intent(in) :: driver
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix
        type(string_t), intent(in) :: feature
        integer :: i
        write (unit, "(A)") ""
        write (unit, "(9A)") "! Set table: ", char (feature)
        write (unit, "(9A)") "subroutine ", char (prefix), &
            "set_", char (feature), "_ptr (pid, ", char (feature), &
            ", shape) bind(C)"
        write (unit, "(9A)") " use iso_c_binding"
        call driver%write_interfaces (unit, feature)
        write (unit, "(9A)") " integer(c_int), intent(in) :: pid"
        write (unit, "(9A)") " integer(c_int), dimension(*), intent(out) :: ", &

```

```

        char (feature)
write (unit, "(9A)") " integer(c_int), dimension(2), intent(in) :: shape"
write (unit, "(9A)") " integer, dimension(:,:), allocatable :: ", &
        char (feature), "_tmp"
write (unit, "(9A)") " integer :: i, j"
write (unit, "(9A)") " select case (pid)"
do i = 1, driver%n_processes
    write (unit, "(2x,A,IO,A)") "case (" , i, ")"
    call driver%record(i)%write_int_sub_call (unit, feature)
end do
write (unit, "(9A)") " end select"
write (unit, "(9A)") "end subroutine ", char (prefix), &
        "set_", char (feature), "_ptr"
end subroutine write_set_int_sub

```

The actual call depends on the type of matrix element.

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_int_sub_call => prclib_driver_record_write_int_sub_call

<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_record_write_int_sub_call (record, unit, feature)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        type(string_t), intent(in) :: feature
        call record%writer%write_int_sub_call (unit, record%id, feature)
    end subroutine prclib_driver_record_write_int_sub_call

```

The interface goes into the writer base type:

```

<Prclib interfaces: prc writer: TBP>+≡
    procedure(write_feature_code), deferred :: write_int_sub_call

```

In the Fortran module case, we need an extra copy in the (academical) situation where default integer and `c_int` differ. Otherwise, we just associate a Fortran array with the C pointer and let the matrix-element subroutine fill the array.

```

<Prclib interfaces: prc writer f module: TBP>+≡
    procedure :: write_int_sub_call => prc_writer_f_module_write_int_sub_call

<Prclib interfaces: procedures>+≡
    subroutine prc_writer_f_module_write_int_sub_call (writer, unit, id, feature)
        class(prc_writer_f_module_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id, feature
        write (unit, "(5x,9A)") "allocate (" , char (feature), "_tmp ", &
            "(shape(1), shape(2)))"
        write (unit, "(5x,9A)") "call ", &
            char (writer%get_c_procname (id, feature)), &
            " (" , char (feature), "_tmp)"
        write (unit, "(5x,9A)") "forall (i=1:shape(1), j=1:shape(2)) "
        write (unit, "(8x,9A)") char (feature), "(i + shape(1)*(j-1)) = ", &
            char (feature), "_tmp", "(i,j)"
        write (unit, "(5x,9A)") "end forall"
    end subroutine prc_writer_f_module_write_int_sub_call

```

In the C library case, we just transfer the C pointer to the library function.

```

<Prclib interfaces: prc writer c lib: TBP>+≡
    procedure :: write_int_sub_call => prc_writer_c_lib_write_int_sub_call

<Prclib interfaces: procedures>+≡
    subroutine prc_writer_c_lib_write_int_sub_call (writer, unit, id, feature)
        class(prc_writer_c_lib_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id, feature
        write (unit, "(5x,9A)") "call ", &
            char (writer%get_c_procname (id, feature)), " (", char (feature), ")"
    end subroutine prc_writer_c_lib_write_int_sub_call

```

Color state table

The color-state specification needs a table of integers (one array per color flow) and a corresponding array of color-ghost flags.

```

<Prclib interfaces: public>+≡
    public :: prc_set_col_state

<Prclib interfaces: interfaces>+≡
    abstract interface
        subroutine prc_set_col_state (pid, col_state, ghost_flag, shape) bind(C)
            import
            integer(c_int), intent(in) :: pid
            integer(c_int), dimension(*), intent(out) :: col_state
            logical(c_bool), dimension(*), intent(out) :: ghost_flag
            integer(c_int), dimension(3), intent(in) :: shape
        end subroutine prc_set_col_state
    end interface

<Prclib interfaces: prclib driver: TBP>+≡

        type(string_t), intent(in) :: id
        write (unit, "(9A)") " allocate (col_state_tmp ", &
            "(shape(1), shape(2), shape(3)))"
        write (unit, "(5x,9A)") "allocate (ghost_flag_tmp ", &
            "(shape(2), shape(3)))"
        write (unit, "(5x,9A)") "call ", &
            char (writer%get_c_procname (id, var_str ("col_state"))), &
            " (col_state_tmp, ghost_flag_tmp)"
        write (unit, "(5x,9A)") "forall (i = 1:shape(2), j = 1:shape(3))"
        write (unit, "(8x,9A)") "forall (k = 1:shape(1))"
        write (unit, "(11x,9A)") &
            "col_state(k + shape(1) * (i + shape(2)*(j-1) - 1)) ", &
            "= col_state_tmp(k,i,j)"
    end subroutine prc_writer_f_module_write_col_state_call

```

```

write (unit, "(8x,9A)") "end forall"
write (unit, "(8x,9A)") &
    "ghost_flag(i + shape(2)*(j-1)) = ghost_flag_tmp(i,j)"
write (unit, "(5x,9A)") "end forall"
end subroutine prc_writer_f_module_write_col_state_call

```

In the C library case, we just transfer the C pointer to the library function.

```

<Prclib interfaces: prc writer c lib: TBP>+≡
  procedure :: write_col_state_call => prc_writer_c_lib_write_col_state_call

<Prclib interfaces: procedures>+≡
  subroutine prc_writer_c_lib_write_col_state_call (writer, unit, id)
    class(prc_writer_c_lib_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id
    write (unit, "(5x,9A)") "call ", &
        char (writer%get_c_procname (id, var_str ("col_state"))), &
        " (col_state, ghost_flag)"
  end subroutine prc_writer_c_lib_write_col_state_call

```

Color factors

For the color-factor information, we return two integer arrays and a complex array.

```

<Prclib interfaces: public>+≡
  public :: prc_set_color_factors

<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine prc_set_color_factors &
        (pid, cf_index1, cf_index2, color_factors, shape) bind(C)
    import
    integer(c_int), intent(in) :: pid
    integer(c_int), dimension(*), intent(out) :: cf_index1, cf_index2
    complex(c_default_complex), dimension(*), intent(out) :: color_factors
    integer(c_int), dimension(1), intent(in) :: shape
  end subroutine prc_set_color_factors
end interface

```

This subroutine returns the color-flavor factor table.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: write_set_color_factors_sub

<Prclib interfaces: procedures>+≡
  subroutine write_set_color_factors_sub (driver, unit, prefix)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: unit
    type(string_t), intent(in) :: prefix
    integer :: i
    type(string_t) :: feature
    feature = "color_factors"
    write (unit, "(A)") ""

```

```

write (unit, "(A)")  "! Set tables: color factors"
write (unit, "(9A)") "subroutine ", char (prefix), &
    "set_color_factors_ptr (pid, cf_index1, cf_index2, color_factors, ", &
    "shape) bind(C)"
write (unit, "(A)")  " use iso_c_binding"
write (unit, "(A)")  " use kinds"
write (unit, "(A)")  " use omega_color"
call driver%write_interfaces (unit, feature)
write (unit, "(A)")  " integer(c_int), intent(in) :: pid"
write (unit, "(A)")  " integer(c_int), dimension(1), intent(in) :: shape"
write (unit, "(A)")  " integer(c_int), dimension(*), intent(out) :: &
    &cf_index1, cf_index2"
write (unit, "(A)")  " complex(c_default_complex), dimension(*), &
    &intent(out) :: color_factors"
write (unit, "(A)")  " type(omega_color_factor), dimension(:), &
    &allocatable :: cf"
write (unit, "(A)")  " select case (pid)"
do i = 1, driver%n_processes
    write (unit, "(2x,A,IO,A)") "case (", i, ")"
    call driver%record(i)%write_color_factors_call (unit)
end do
write (unit, "(A)")  " end select"
write (unit, "(A)")  "end subroutine " // char (prefix) &
    // "set_color_factors_ptr"
end subroutine write_set_color_factors_sub

```

The actual call depends on the type of matrix element.

```

<Prclib interfaces: prclib driver record: TBP>+≡
    procedure :: write_color_factors_call => prclib_driver_record_write_color_factors_call

<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_record_write_color_factors_call (record, unit)
        class(prclib_driver_record_t), intent(in) :: record
        integer, intent(in) :: unit
        call record%writer%write_color_factors_call (unit, record%id)
    end subroutine prclib_driver_record_write_color_factors_call

```

The interface goes into the writer base type:

```

<Prclib interfaces: prc writer: TBP>+≡
    procedure(write_code), deferred :: write_color_factors_call

In the Fortran module case, the matrix-element procedure fills an array of
omega_color_factor elements. We distribute this array among two integer
arrays and one complex-valued array, for which we have the C pointers.

<Prclib interfaces: prc writer f module: TBP>+≡
    procedure :: write_color_factors_call => prc_writer_f_module_write_color_factors_call

<Prclib interfaces: procedures>+≡
    subroutine prc_writer_f_module_write_color_factors_call (writer, unit, id)
        class(prc_writer_f_module_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
        write (unit, "(5x,A)") "allocate (cf (shape(1)))"
        write (unit, "(5x,9A)") "call ", &

```

```

        char (writer%get_c_procname (id, var_str ("color_factors"))), " (cf)"
write (unit, "(5x,9A)") "cf_index1(1:shape(1)) = cf%i1"
write (unit, "(5x,9A)") "cf_index2(1:shape(1)) = cf%i2"
write (unit, "(5x,9A)") "color_factors(1:shape(1)) = cf%factor"
end subroutine prc_writer_f_module_write_color_factors_call

```

In the C library case, we just transfer the C pointers to the library function. There are three arrays.

```

<Prclib interfaces: prc_writer c lib: TBP>+≡
  procedure :: write_color_factors_call => &
    prc_writer_c_lib_write_color_factors_call

<Prclib interfaces: procedures>+≡
  subroutine prc_writer_c_lib_write_color_factors_call (writer, unit, id)
    class(prc_writer_c_lib_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id
    write (unit, "(5x,9A)") "call ", &
      char (writer%get_c_procname (id, var_str ("color_factors"))), &
      " (cf_index1, cf_index2, color_factors)"
  end subroutine prc_writer_c_lib_write_color_factors_call

```

14.2.10 Interfaces for C-library matrix element

If the matrix element code is not provided as a Fortran module but as a C or bind(C) Fortran library, we need explicit interfaces for the library functions. They are not identical to the Fortran module versions. They transfer pointers directly.

The implementation is part of the `prc_writer_c_lib` type, which serves as base type for all C-library writers. It writes specific interfaces depending on the feature.

We bind this as the method `write_standard_interface` instead of `write_interface`, because we have to override the latter. Otherwise we could not call the method because the writer type is abstract.

```

<Prclib interfaces: prc_writer c lib: TBP>+≡
  procedure :: write_standard_interface => prc_writer_c_lib_write_interface

<Prclib interfaces: procedures>+≡
  subroutine prc_writer_c_lib_write_interface (writer, unit, id, feature)
    class(prc_writer_c_lib_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id, feature
    select case (char (feature))
    case ("md5sum")
      write (unit, "(2x,9A)") "interface"
      write (unit, "(5x,9A)") "function ", &
        char (writer%get_c_procname (id, var_str ("get_md5sum"))), &
        " () result (cptr) bind(C)"
      write (unit, "(7x,9A)") "import"
      write (unit, "(7x,9A)") "implicit none"
      write (unit, "(7x,9A)") "type(c_ptr) :: cptr"
      write (unit, "(5x,9A)") "end function ", &

```

```

        char (writer%get_c_procname (id, var_str ("get_md5sum")))
        write (unit, "(2x,9A)") "end interface"
case ("openmp_supported")
    write (unit, "(2x,9A)") "interface"
    write (unit, "(5x,9A)") "function ", &
        char (writer%get_c_procname (id, feature)), &
        " () result (status) bind(C)"
    write (unit, "(7x,9A)") "import"
    write (unit, "(7x,9A)") "implicit none"
    write (unit, "(7x,9A)") "logical(c_bool) :: status"
    write (unit, "(5x,9A)") "end function ", &
        char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)") "end interface"
case ("n_in", "n_out", "n_flv", "n_hel", "n_col", "n_cin", "n_cf")
    write (unit, "(2x,9A)") "interface"
    write (unit, "(5x,9A)") "function ", &
        char (writer%get_c_procname (id, feature)), &
        " () result (n) bind(C)"
    write (unit, "(7x,9A)") "import"
    write (unit, "(7x,9A)") "implicit none"
    write (unit, "(7x,9A)") "integer(c_int) :: n"
    write (unit, "(5x,9A)") "end function ", &
        char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)") "end interface"
case ("flv_state", "hel_state")
    write (unit, "(2x,9A)") "interface"
    write (unit, "(5x,9A)") "subroutine ", &
        char (writer%get_c_procname (id, feature)), &
        " (", char (feature), ") bind(C)"
    write (unit, "(7x,9A)") "import"
    write (unit, "(7x,9A)") "implicit none"
    write (unit, "(7x,9A)") "integer(c_int), dimension(*), intent(out) ", &
        ":", char (feature)
    write (unit, "(5x,9A)") "end subroutine ", &
        char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)") "end interface"
case ("col_state")
    write (unit, "(2x,9A)") "interface"
    write (unit, "(5x,9A)") "subroutine ", &
        char (writer%get_c_procname (id, feature)), &
        " (col_state, ghost_flag) bind(C)"
    write (unit, "(7x,9A)") "import"
    write (unit, "(7x,9A)") "implicit none"
    write (unit, "(7x,9A)") "integer(c_int), dimension(*), intent(out) ", &
        ":", col_state"
    write (unit, "(7x,9A)") "logical(c_bool), dimension(*), intent(out) ", &
        ":", ghost_flag"
    write (unit, "(5x,9A)") "end subroutine ", &
        char (writer%get_c_procname (id, feature))
    write (unit, "(2x,9A)") "end interface"
case ("color_factors")
    write (unit, "(2x,9A)") "interface"
    write (unit, "(5x,9A)") "subroutine ", &
        char (writer%get_c_procname (id, feature)), &

```

```

      " (cf_index1, cf_index2, color_factors) bind(C)"
write (unit, "(7x,9A)") "import"
write (unit, "(7x,9A)") "implicit none"
write (unit, "(7x,9A)") "integer(c_int), dimension(*), &
&intent(out) :: cf_index1"
write (unit, "(7x,9A)") "integer(c_int), dimension(*), &
&intent(out) :: cf_index2"
write (unit, "(7x,9A)") "complex(c_default_complex), dimension(*), &
&intent(out) :: color_factors"
write (unit, "(5x,9A)") "end subroutine ", &
char (writer%get_c_procname (id, feature))
write (unit, "(2x,9A)") "end interface"
end select
end subroutine prc_writer_c_lib_write_interface

```

14.2.11 Retrieving the tables

In the previous section we had the writer routines for procedures that return tables, actually C pointers to tables. Here, we write convenience routines that unpack them and move the contents to suitable Fortran arrays.

The flavor and helicity tables are two-dimensional integer arrays. We use intermediate storage for correctly transforming C to Fortran data types.

```

<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: set_flv_state => prclib_driver_set_flv_state
  procedure :: set_hel_state => prclib_driver_set_hel_state

<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_set_flv_state (driver, i, flv_state)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
    integer, dimension(:,:), allocatable, intent(out) :: flv_state
    integer :: n_tot, n_flv
    integer(c_int) :: pid
    integer(c_int), dimension(:,:), allocatable :: c_flv_state
    pid = i
    n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
    n_flv = driver%get_n_flv (pid)
    allocate (flv_state (n_tot, n_flv))
    allocate (c_flv_state (n_tot, n_flv))
    call driver%set_flv_state_ptr &
      (pid, c_flv_state, int ([n_tot, n_flv], kind=c_int))
    flv_state = c_flv_state
  end subroutine prclib_driver_set_flv_state

  subroutine prclib_driver_set_hel_state (driver, i, hel_state)
    class(prclib_driver_t), intent(in) :: driver
    integer, intent(in) :: i
    integer, dimension(:,:), allocatable, intent(out) :: hel_state
    integer :: n_tot, n_hel
    integer(c_int) :: pid
    integer(c_int), dimension(:,:), allocatable, target :: c_hel_state
    pid = i

```

```

n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
n_hel = driver%get_n_hel (pid)
allocate (hel_state (n_tot, n_hel))
allocate (c_hel_state (n_tot, n_hel))
call driver%set_hel_state_ptr &
    (pid, c_hel_state, int ([n_tot, n_hel], kind=c_int))
hel_state = c_hel_state
end subroutine prclib_driver_set_hel_state

```

The color-flow table is three-dimensional, otherwise similar. We simultaneously set the ghost-flag table, which consists of logical entries.

```

<Prclib interfaces: prclib driver: TBP>+≡
    procedure :: set_col_state => prclib_driver_set_col_state

<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_set_col_state (driver, i, col_state, ghost_flag)
        class(prclib_driver_t), intent(in) :: driver
        integer, intent(in) :: i
        integer, dimension(:, :, :), allocatable, intent(out) :: col_state
        logical, dimension(:, :, :), allocatable, intent(out) :: ghost_flag
        integer :: n_cin, n_tot, n_col
        integer(c_int) :: pid
        integer(c_int), dimension(:, :, :), allocatable :: c_col_state
        logical(c_bool), dimension(:, :, :), allocatable :: c_ghost_flag
        pid = i
        n_cin = driver%get_n_cin (pid)
        n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
        n_col = driver%get_n_col (pid)
        allocate (col_state (n_cin, n_tot, n_col))
        allocate (c_col_state (n_cin, n_tot, n_col))
        allocate (ghost_flag (n_tot, n_col))
        allocate (c_ghost_flag (n_tot, n_col))
        call driver%set_col_state_ptr (pid, &
            c_col_state, c_ghost_flag, int ([n_cin, n_tot, n_col], kind=c_int))
        col_state = c_col_state
        ghost_flag = c_ghost_flag
    end subroutine prclib_driver_set_col_state

```

The color-factor table is a sparse matrix: a two-column array of indices and one array which contains the corresponding factors.

```

<Prclib interfaces: prclib driver: TBP>+≡
    procedure :: set_color_factors => prclib_driver_set_color_factors

<Prclib interfaces: procedures>+≡
    subroutine prclib_driver_set_color_factors (driver, i, color_factors, cf_index)
        class(prclib_driver_t), intent(in) :: driver
        integer, intent(in) :: i
        complex(default), dimension(:), allocatable, intent(out) :: color_factors
        integer, dimension(:, :), allocatable, intent(out) :: cf_index
        integer :: n_cf
        integer(c_int) :: pid
        complex(c_default_complex), dimension(:), allocatable, target :: c_color_factors
        integer(c_int), dimension(:), allocatable, target :: c_cf_index1
        integer(c_int), dimension(:), allocatable, target :: c_cf_index2

```

```

pid = i
n_cf = driver%get_n_cf (pid)
allocate (color_factors (n_cf))
allocate (c_color_factors (n_cf))
allocate (c_cf_index1 (n_cf))
allocate (c_cf_index2 (n_cf))
call driver%set_color_factors_ptr (pid, &
    c_cf_index1, c_cf_index2, &
    c_color_factors, int ([n_cf], kind=c_int))
color_factors = c_color_factors
allocate (cf_index (2, n_cf))
cf_index(1,:) = c_cf_index1
cf_index(2,:) = c_cf_index2
end subroutine prclib_driver_set_color_factors

```

14.2.12 Returning a procedure pointer

The functions that directly access the matrix element, event by event, are assigned to a process-specific driver object as procedure pointers. For the `dlopen` interface, we use C function pointers. This subroutine returns such a pointer:

```

<Prclib interfaces: public>+≡
public :: prc_get_fptr

<Prclib interfaces: interfaces>+≡
abstract interface
  subroutine prc_get_fptr (pid, fid, fptr) bind(C)
    import
    integer(c_int), intent(in) :: pid
    integer(c_int), intent(in) :: fid
    type(c_funptr), intent(out) :: fptr
  end subroutine prc_get_fptr
end interface

```

This procedure writes the source code for the procedure pointer returning subroutine.

All C functions that are provided by the matrix element code of a specific process are handled here. The selection consists of a double layered `select case` construct.

```

<Prclib interfaces: prclib driver: TBP>+≡
procedure :: write_get_fptr_sub

<Prclib interfaces: procedures>+≡
subroutine write_get_fptr_sub (driver, unit, prefix)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: unit
  type(string_t), intent(in) :: prefix
  integer :: i, j
  write (unit, "(A)") ""
  write (unit, "(A)") "! Return C pointer to a procedure:"
  write (unit, "(A)") "! pid = process index; fid = function index"
  write (unit, "(4A)") "subroutine ", char (prefix), "get_fptr ", &
    "(pid, fid, fptr) bind(C)"

```

```

write (unit, "(A)") " use iso_c_binding"
write (unit, "(A)") " use kinds"
write (unit, "(A)") " implicit none"
write (unit, "(A)") " integer(c_int), intent(in) :: pid"
write (unit, "(A)") " integer(c_int), intent(in) :: fid"
write (unit, "(A)") " type(c_funptr), intent(out) :: fptr"
do i = 1, driver%n_processes
  call driver%record(i)%write_interfaces (unit)
end do
write (unit, "(A)") " select case (pid)"
do i = 1, driver%n_processes
  write (unit, "(2x,A,IO,A)") "case (" , i, ")"
  write (unit, "(5x,A)") "select case (fid)"
  associate (record => driver%record(i))
    do j = 1, size (record%feature)
      write (unit, "(5x,A,IO,9A)") "case (" , j, "); " , &
        "fptr = c_funloc (" , &
        char (record%get_c_procname (record%feature(j))), &
        ")"
    end do
  end associate
  write (unit, "(5x,A)") "end select"
end do
write (unit, "(A)") " end select"
write (unit, "(3A)") "end subroutine " , char (prefix), "get_fptr"
end subroutine write_get_fptr_sub

```

The procedures for which we want to return a pointer (the 'features' of the matrix element code) are actually Fortran module procedures. If we want to have a C signature, we must write wrapper functions for all of them. The procedures, their signatures, and the appropriate writer routines are specific for the process type.

To keep this generic, we do not provide the writer routines here, but just the interface for a writer routine. The actual routines are stored in the process record.

The **prefix** indicates the library, the **id** indicates the process, and **procname** is the bare name of the procedure to be written.

```

<Prclib interfaces: public>+≡
  public :: write_driver_code

<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine write_driver_code (unit, prefix, id, procname)
      import
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      type(string_t), intent(in) :: id
      type(string_t), intent(in) :: procname
    end subroutine write_driver_code
  end interface

```

14.2.13 Hooks

Interface for additional library unload / reload hooks (currently unused!)

```
<Prclib interfaces: public>+≡
  public :: prclib_unload_hook
  public :: prclib_reload_hook
<Prclib interfaces: interfaces>+≡
  abstract interface
    subroutine prclib_unload_hook (libname)
      import
      type(string_t), intent(in) :: libname
    end subroutine prclib_unload_hook

    subroutine prclib_reload_hook (libname)
      import
      type(string_t), intent(in) :: libname
    end subroutine prclib_reload_hook
  end interface
```

14.2.14 Make source, compile, link

Since we should have written a Makefile, these tasks amount to simple make calls. Note that the Makefile targets depend on each other, so calling link executes also the source and compile steps, when necessary.

The first routine writes source-code files for the individual processes. First it calls the writer routines directly for each process, then it calls `make source`. The make command may either post-process the files, or it may do the complete work, e.g., calling an external program that generates the files.

```
<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: make_source => prclib_driver_make_source
<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_make_source (driver, os_data)
    class(prclib_driver_t), intent(in) :: driver
    type(os_data_t), intent(in) :: os_data
    integer :: i
    do i = 1, driver%n_processes
      call driver%record(i)%write_source_code ()
    end do
    call os_system_call ("make source " // os_data%makeflags &
      // " -f " // driver%basename // ".makefile")
  end subroutine prclib_driver_make_source
```

Compile matrix element source code and the driver source code.

```
<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: make_compile => prclib_driver_make_compile
<Prclib interfaces: procedures>+≡
  subroutine prclib_driver_make_compile (driver, os_data)
    class(prclib_driver_t), intent(in) :: driver

      // " -f " // driver%basename // ".makefile")
  end subroutine prclib_driver_make_link
```

14.2.15 Clean up generated files

The task of cleaning any generated files should also be deferred to Makefile targets. Apart from removing everything, removing specific files may be useful for partial rebuilds. (Note that removing the makefile itself can only be done once, for obvious reasons.)

If there is no makefile, do nothing.

```
<Prclib interfaces: prclib driver: TBP>+≡
  procedure :: clean_library => prclib_driver_clean_library

end subroutine prclib_interfaces_6

```

This version of test-code writer writes interfaces for all standard features plus one specific feature. The interfaces are all `bind(C)`, so no wrapper is needed.

The driver part is identical to the Fortran case, so we simply extend the previous `test_writer_5` type. We only have to override the Makefile writer.

```

(Prclib interfaces: test types)+≡
type, extends (test_writer_5_t) :: test_writer_6_t
contains

```

```

        procedure, nopass :: type_name => test_writer_6_type_name
        procedure :: write_makefile_code => test_writer_6_mk
        procedure :: write_source_code => test_writer_6_src
    end type test_writer_6_t

```

(Prclib interfaces: tests)+≡

```

function test_writer_6_type_name () result (string)
    type(string_t) :: string
    string = "test_6"
end function test_writer_6_type_name

subroutine test_writer_6_mk (writer, unit, id, os_data, testflag)
    class(test_writer_6_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id
    type(os_data_t), intent(in) :: os_data
    logical, intent(in), optional :: testflag
    write (unit, "(5A)") "SOURCES += ", char (id), ".c"
    write (unit, "(5A)") "OBJECTS += ", char (id), ".lo"
    write (unit, "(5A)") char (id), ".lo: ", char (id), ".c"
    write (unit, "(5A)") TAB, "$(LTCCOMPILE) $<"
end subroutine test_writer_6_mk

subroutine test_writer_6_src (writer, id)
    class(test_writer_6_t), intent(in) :: writer
    type(string_t), intent(in) :: id
    call write_test_c_lib_file (id, var_str ("proc1"))
end subroutine test_writer_6_src

```

We need a test module file (actually, one for each process in the test above) that allows us to check compilation and linking. The test module implements a colorless $1 \rightarrow 2$ process, and it implements one additional function (feature), the name given as an argument.

(Prclib interfaces: tests)+≡

```

subroutine write_test_c_lib_file (basename, feature)
    type(string_t), intent(in) :: basename
    type(string_t), intent(in) :: feature
    integer :: u
    u = free_unit ()
    open (u, file = char (basename) // ".c", &
        status = "replace", action = "write")
    write (u, "(A)") "/* (Pseudo) matrix element code file &
        &for WHIZARD self-test */"
    write (u, "(A)") "#include <stdbool.h>"
    write (u, *)
    call write_test_me_code_4 (u, char (basename))
    write (u, *)
    write (u, "(A)") "void " // char (basename) // "_" &
        // char (feature) // "(int* n) {"
    write (u, "(A)") "    *n = 42;"
    write (u, "(A)") "}"
    close (u)
end subroutine write_test_c_lib_file

```

The following matrix-element source code is equivalent to the code in the previous example, but coded in C.

(Prelib interfaces: tests)+≡

```

subroutine write_test_me_code_4 (u, id)

14.3 Abstract process core configuration

In this module, we define abstract data types that handle the method-specific part of defining a process (including all of its options) and accessing an external matrix element.

There are no unit tests, these are deferred to the `process_libraries` module below.

```

<prc_core_def.f90>≡

```

```

<File header>

module prc_core_def

  <Use strings>
  use io_units
  use diagnostics

  use process_constants
  use prclib_interfaces

  <Standard module head>

  <Prc core def: public>

  <Prc core def: types>

  <Prc core def: interfaces>

  contains

  <Prc core def: procedures>

end module prc_core_def

```

14.3.1 Process core definition type

For storing configuration data that depend on the specific process variant, we introduce a polymorphic type. At this point, we just declare an abstract base type. This allows us to defer the implementation to later modules.

There should be no components that need explicit finalization, otherwise we would have to call a finalizer from the `process_component_def_t` wrapper.

```

<Prc core def: public>≡
  public :: prc_core_def_t

<Prc core def: types>≡
  type, abstract :: prc_core_def_t
  class(prc_writer_t), allocatable :: writer
  contains
  <Prc core def: process core def: TBP>
  end type prc_core_def_t

```

Interfaces for the deferred methods.

This returns a string. No passed argument; the string is constant and depends just on the type.

```

<Prc core def: process core def: TBP>≡
  procedure (prc_core_def_get_string), nopass, deferred :: type_string

<Prc core def: interfaces>≡
  abstract interface
    function prc_core_def_get_string () result (string)
      import
      type(string_t) :: string

```

```

        end function prc_core_def_get_string
    end interface

```

The `write` method should display the content completely.

```

<Prc core def: process core def: TBP>+≡
    procedure (prc_core_def_write), deferred :: write

<Prc core def: interfaces>+≡
    abstract interface
        subroutine prc_core_def_write (object, unit)
            import
                class(prc_core_def_t), intent(in) :: object
                integer, intent(in) :: unit
            end subroutine prc_core_def_write
    end interface

```

The `read` method should fill the content completely.

```

<Prc core def: process core def: TBP>+≡
    procedure (prc_core_def_read), deferred :: read

<Prc core def: interfaces>+≡
    abstract interface
        subroutine prc_core_def_read (object, unit)
            import
                class(prc_core_def_t), intent(out) :: object
                integer, intent(in) :: unit
            end subroutine prc_core_def_read
    end interface

```

This communicates a MD5 checksum to the writer inside the `core_def` object, if there is any. Usually, this checksum is not yet known at the time when the writer is initialized.

```

<Prc core def: process core def: TBP>+≡
    procedure :: set_md5sum => prc_core_def_set_md5sum

<Prc core def: procedures>≡
    subroutine prc_core_def_set_md5sum (core_def, md5sum)
        class(prc_core_def_t), intent(inout) :: core_def
        character(32) :: md5sum
        if (allocated (core_def%writer)) core_def%writer%md5sum = md5sum
    end subroutine prc_core_def_set_md5sum

```

Allocate an appropriate driver object which corresponds to the chosen process core definition.

For internal matrix element (i.e., those which do not need external code), the driver should have access to all matrix element information from the beginning. In short, it is the matrix-element code.

For external matrix elements, the driver will get access to the external matrix element code.

```

<Prc core def: process core def: TBP>+≡
    procedure(prc_core_def_allocate_driver), deferred :: allocate_driver

```

```

<Prc core def: interfaces>+≡
  interface
    subroutine prc_core_def_allocate_driver (object, driver, basename)
      import
      class(prc_core_def_t), intent(in) :: object
      class(prc_core_driver_t), intent(out), allocatable :: driver
      type(string_t), intent(in) :: basename
    end subroutine prc_core_def_allocate_driver
  end interface

```

This flag tells whether the particular variant needs external code. We implement a default function which returns false. The flag depends only on the type, therefore we implement it as `nopass`.

```

<Prc core def: process core def: TBP>+≡
  procedure, nopass :: needs_code => prc_core_def_needs_code

<Prc core def: procedures>+≡
  function prc_core_def_needs_code () result (flag)
    logical :: flag
    flag = .false.
  end function prc_core_def_needs_code

```

This subroutine allocates an array which holds the name of all features that this process core implements. This feature applies to matrix element code that is not coded as a Fortran module but communicates via independent library functions, which follow the C calling conventions. The addresses of those functions are returned as C function pointers, which can be converted into Fortran procedure pointers. The conversion is done in code specific for the process variant; here we just retrieve the C function pointer.

The array returned here serves the purpose of writing specific driver code. The driver interfaces only those C functions which are supported for the given process core.

If the process core does not require external code, this array is meaningless.

```

<Prc core def: process core def: TBP>+≡
  procedure(prc_core_def_get_features), nopass, deferred &
    :: get_features

<Prc core def: interfaces>+≡
  abstract interface
    subroutine prc_core_def_get_features (features)
      import
      type(string_t), dimension(:), allocatable, intent(out) :: features
    end subroutine prc_core_def_get_features
  end interface

```

Assign pointers to the process-specific procedures to the driver, if the process is external.

```

<Prc core def: process core def: TBP>+≡
  procedure(prc_core_def_connect), deferred :: connect

```

```

<Prc core def: interfaces>+≡
  abstract interface
    subroutine prc_core_def_connect (def, lib_driver, i, proc_driver)
      import
      class(prc_core_def_t), intent(in) :: def
      class(prclib_driver_t), intent(in) :: lib_driver
      integer, intent(in) :: i
      class(prc_core_driver_t), intent(inout) :: proc_driver
    end subroutine prc_core_def_connect
  end interface

```

14.3.2 Process core template

We must be able to automatically allocate a process core definition object with the appropriate type, given only the type name.

To this end, we introduce a `prc_template_t` type which is simply a wrapper for an empty `prc_core_def_t` object. Choosing one of the templates from an array, we can allocate the target object.

```

<Prc core def: public>+≡
  public :: prc_template_t

<Prc core def: types>+≡
  type :: prc_template_t
    class(prc_core_def_t), allocatable :: core_def
  end type prc_template_t

```

The allocation routine. We use the `source` option of the `allocate` statement. The `mold` option would probably more appropriate, but is a F2008 feature.

```

<Prc core def: public>+≡
  public :: allocate_core_def

<Prc core def: procedures>+≡
  subroutine allocate_core_def (template, name, core_def)
    type(prc_template_t), dimension(:), intent(in) :: template
    type(string_t), intent(in) :: name
    class(prc_core_def_t), allocatable :: core_def
    integer :: i
    do i = 1, size (template)
      if (template(i)%core_def%type_string () == name) then
        allocate (core_def, source = template(i)%core_def)
        return
      end if
    end do
  end subroutine allocate_core_def

```

14.3.3 Process driver

For each process component, we implement a driver object which holds the calls to the matrix element and various auxiliary routines as procedure pointers. Any actual calculation will use this object to communicate with the process.

Depending on the type of process (as described by a corresponding `prc_core_def` object), the procedure pointers may refer to external or internal code, and there may be additional procedures for certain types. The base type defined here is abstract.

```

<Prc core def: public>+≡
    public :: prc_core_driver_t

<Prc core def: types>+≡
    type, abstract :: prc_core_driver_t
    contains
    <Prc core def: process driver: TBP>
    end type prc_core_driver_t

```

This returns the process type. No reference to contents.

```

<Prc core def: process driver: TBP>≡
    procedure(prc_core_driver_type_name), nopass, deferred :: type_name

<Prc core def: interfaces>+≡
    abstract interface
        function prc_core_driver_type_name () result (type)
            import
            type(string_t) :: type
        end function prc_core_driver_type_name
    end interface

```

14.3.4 Process driver for intrinsic process

This is an abstract extension for the driver type. It has one additional method, namely a subroutine that fills the record of constant process data. For an external process, this task is performed by the external library driver instead.

```

<Prc core def: public>+≡
    public :: process_driver_internal_t

<Prc core def: types>+≡
    type, extends (prc_core_driver_t), abstract :: process_driver_internal_t
    contains
    <Prc core def: process driver internal: TBP>
    end type process_driver_internal_t

<Prc core def: process driver internal: TBP>≡
    procedure(process_driver_fill_constants), deferred :: fill_constants

<Prc core def: interfaces>+≡
    abstract interface
        subroutine process_driver_fill_constants (driver, data)
            import
            class(process_driver_internal_t), intent(in) :: driver
            type(process_constants_t), intent(out) :: data
        end subroutine process_driver_fill_constants
    end interface

```

14.4 Process library access

Processes (the code and data that are necessary for evaluating matrix elements of a particular process or process component) are organized in process libraries. In full form, process libraries contain generated and dynamically compiled and linked code, so they are actual libraries on the OS level. Alternatively, there may be simple processes that can be generated without referring to external libraries, and external libraries that are just linked in.

This module interfaces the OS to create, build, and use process libraries.

We work with two related data structures. There is the list of process configurations that stores the user input and data derived from it. A given process configuration list is scanned for creating a process library, which consists of both data and code. The creation step involves calling external programs and incorporating external code.

For the subsequent integration and event generation steps, we read the process library. We also support partial (re)creation of the process library. To this end, we should be able to reconstruct the configuration data records from the process library.

```
<process_libraries.f90>≡  
  <File header>
```

```
module process_libraries
```

```
  use iso_c_binding !NODEP!  
  use kinds  
  <Use strings>  
  use io_units  
  use unit_tests  
  use diagnostics  
  use md5  
  use os_interface  
  use lexers  
  use model_data  
  use particle_specifiers  
  use process_constants  
  use prclib_interfaces  
  use prc_core_def
```

```
  <Standard module head>
```

```
  <Process libraries: public>
```

```
  <Process libraries: parameters>
```

```
  <Process libraries: types>
```

```
  <Process libraries: interfaces>
```

```
  <Process libraries: test declarations>
```

```
contains
```

⟨Process libraries: procedures⟩

⟨Process libraries: tests⟩

`end module process_libraries`

14.4.1 Auxiliary stuff

Here is a small subroutine that strips the left-hand side and the equals sign off an equation.

```
⟨Process libraries: procedures⟩≡
  subroutine strip_prefix (buffer)
    character(*), intent(inout) :: buffer
    type(string_t) :: string, prefix
    string = buffer
    call split (string, prefix, "=")
    buffer = string
  end subroutine strip_prefix
```

14.4.2 Process definition objects

We collect process configuration data in a derived type, `process_def_t`. A process can be a collection of several components which are treated as a single entity for the purpose of observables and event generation. Multiple process components may initially be defined by the user. The system may add additional components, e.g., subtraction terms. The common data type is `process_component_def_t`. Within each component, there are several universal data items, and a part which depend on the particular process variant. The latter is covered by an abstract type `prc_core_def_t` and its extensions.

Wrapper for components

We define a wrapper type for the configuration of individual components.

The string `basename` is used for building file, module, and function names for the current process component. Initially, it will be built from the corresponding process basename by appending an alphanumeric suffix.

The logical `initial` tells whether this is a user-defined (true) or system-generated (false) configuration.

The numbers `n_in`, `n_out`, and `n_tot` denote the incoming, outgoing and total number of particles (partons) participating in the process component, respectively. These are the nominal particles, as input by the user (recombination may change the particle content, for the output events).

The string arrays `prt_in` and `prt_out` hold the particle specifications as provided by the user. For a system-generated process component, they remain deallocated.

The `method` string is used to determine the type of process matrix element and how it is obtained.

The `description` string collects the information about particle content and method in a single human-readable string.

The pointer object `core_def` is allocated according to the actual process variant, which depends on the method. The subobject holds any additional configuration data that is relevant for the process component.

We assume that no finalizer is needed.

```

(Process libraries: public)≡
  public :: process_component_def_t

Compute the MD5 sum of a process component. We reset the stored MD5 sum to the empty string (so a previous value is not included in the calculation), then write a temporary file and calculate the MD5 sum of that file.

This implies that all data that are displayed by the `write` method become part of the MD5 sum calculation.

The `model` is not part of the object, but must be included in the MD5 sum. Otherwise, modifying the model and nothing else would not trigger remaking the process-component source. Note that the model parameters may change later and therefore are not incorporated.

After the MD5 sum of the component has been computed, we communicate it to the `writer` subobject of the specific `core_def` component. Although these types are abstract, the MD5-related features are valid for the abstract types.

```

Process definition

The process component definitions are collected in a common process definition object.

The id is the ID string that the user has provided for identifying this process. It must be a string that is allowed as part of a Fortran variable name, since it may be used for generating code.

The number `n_in` is 1 or 2 for a decay or scattering process, respectively. This must be identical to `n_in` for all components.

The initial and extra component definitions (see above) are allocated as the `initial` and `extra` arrays, respectively. The latter are determined from the former.

The `md5sum` is used to verify the integrity of the configuration.

```

<Process libraries: public>+≡
    public :: process_def_t

<Process libraries: types>+≡
    type :: process_def_t
        private

      end do
    end if
  end subroutine process_def_show

```

Initialize an entry (initialize the process definition inside). We allocate the 'initial' set of components. Extra components remain unallocated.

The model should be present as a pointer. This allows us to retrieve the model's MD5 sum. However, for various tests it is sufficient to have the name.

We create the basenames for the process components by appending a suffix which we increment for each component.

```

<Process libraries: process def: TBP>+≡

    end do
    def%initial%description = ""
  end subroutine process_def_init

```

Initialize an initial component. The particle content must be specified. The process core block is not (yet) allocated.

We assume that the particle arrays match the `n_in` and `n_out` values in size. The model is referred to by name; it is identified as an existing model later. The index `i` must refer to an existing element of the component array.

Data specific for the process core of a component are imported as the `core_def` argument. We should allocate an object of class `prc_core_def_t` with the appropriate specific type, fill it, and transfer it to the process component definition here. The allocation is moved, so the original allocated object is returned empty.

```

```

This query tells whether a specific process component relies on external code. This includes all traditional WHIZARD matrix elements which rely on O'MEGA for code generation. Other process components (trivial decays, subtraction terms) do not require external code.

NOTE: Implemented only for initial component.

The query is passed to the process component.

```

<Process libraries: process def: TBP>+≡
  procedure :: needs_code => process_def_needs_code

<Process libraries: procedures>+≡
  function process_def_needs_code (def, i_component) result (flag)
    class(process_def_t), intent(in) :: def
    integer, intent(in) :: i_component
    logical :: flag
    flag = def%initial(i_component)%needs_code ()
  end function process_def_needs_code

```

Process definition list

A list of process definitions is the starting point for creating a process library. The list is built when reading the user input. When reading an existing process library, the list is used for cross-checking and updating the configuration.

We need a type for the list entry. The simplest way is to extend the process definition type, so all methods apply to the process definition directly.

```

<Process libraries: public>+≡
  public :: process_def_entry_t

<Process libraries: types>+≡
  type, extends (process_def_t) :: process_def_entry_t
  private
    type(process_def_entry_t), pointer :: next => null ()
  end type process_def_entry_t

```

This is the type for the list itself.

```

<Process libraries: types>+≡
  type :: process_def_list_t
  private
    type(process_def_entry_t), pointer :: first => null ()
    type(process_def_entry_t), pointer :: last => null ()
  contains
    <Process libraries: process def list: TBP>
  end type process_def_list_t

```

The deallocates the list iteratively. We assume that the list entries do not need finalization themselves.

```

(Process libraries: process def list: TBP)≡
  procedure :: final => process_def_list_final

(Process libraries: procedures)+≡
  subroutine process_def_list_final (list)
    class(process_def_list_t), intent(inout) :: list
    type(process_def_entry_t), pointer :: current
    nullify (list%last)
    do while (associated (list%first))
      current => list%first
      list%first => current%next
      deallocate (current)
    end do
  end subroutine process_def_list_final

```

Write the complete list.

```

(Process libraries: process def list: TBP)+≡
  procedure :: write => process_def_list_write

(Process libraries: procedures)+≡
  subroutine process_def_list_write (object, unit, libpath)
    class(process_def_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: libpath
    type(process_def_entry_t), pointer :: entry
    integer :: i, u
    u = given_output_unit (unit)
    if (associated (object%first)) then
      i = 1
      entry => object%first
      do while (associated (entry))
        write (u, "(1x,A,I0,A)" "Process #", i, ":")
        call entry%write (u)
        i = i + 1
        entry => entry%next
        if (associated (entry)) write (u, *)
      end do
    else
      write (u, "(1x,A)" "Process definition list: [empty]"
    end if
  end subroutine process_def_list_write

```

Short account.

```

(Process libraries: process def list: TBP)+≡
  procedure :: show => process_def_list_show

(Process libraries: procedures)+≡
  subroutine process_def_list_show (object, unit)
    class(process_def_list_t), intent(in) :: object
    integer, intent(in), optional :: unit
    type(process_def_entry_t), pointer :: entry
    integer :: u

```

```

u = given_output_unit (unit)
if (associated (object%first)) then
  write (u, "(2x,A)") "Processes:"
  entry => object%first
  do while (associated (entry))
    call entry%show (u)
    entry => entry%next
  end do
else
  write (u, "(2x,A)") "Processes: [empty]"
end if
end subroutine process_def_list_show

```

Read the complete list. We need an array of templates for the component sub-objects of abstract `prc_core_t` type, to allocate them with the correct specific type.

NOTE: Error handling is missing. Reading will just be aborted on error, or an I/O error occurs.

```

<Process libraries: process def list: TBP>+≡
  procedure :: read => process_def_list_read

<Process libraries: procedures>+≡
  subroutine process_def_list_read (object, unit, core_def_templates)
    class(process_def_list_t), intent(out) :: object
    integer, intent(in) :: unit
    type(prc_template_t), dimension(:), intent(in) :: core_def_templates
    type(process_def_entry_t), pointer :: entry
    character(80) :: buffer, ref
    integer :: i
    read (unit, "(A)") buffer
    write (ref, "(1x,A)") "Process definition list: [empty]"
    if (buffer == ref) return ! OK: empty library
    backspace (unit)
    READ_ENTRIES: do i = 1, huge (0)
      if (i > 1) read (unit, *, end=1)
      read (unit, "(A)") buffer

      write (ref, "(1x,A,I0,A)") "Process #", i, ":"
      if (buffer /= ref) return ! Wrong process header: done.
      allocate (entry)
      call entry%read (unit, core_def_templates)
      call object%append (entry)
    end do READ_ENTRIES
  1 continue ! EOF: done
end subroutine process_def_list_read

```

Append an entry to the list. The entry should be allocated as a pointer, and the pointer allocation is transferred. The original pointer is returned null.

```

<Process libraries: process def list: TBP>+≡
  procedure :: append => process_def_list_append

```

14.4.3 Process library

The process library object is the interface between the process definition data, as provided by the user, generated or linked process code on file, and the process run data that reference the process code.

Process library entry

For each process component that is part of the library, there is a separate library entry (`process_library_entry_t`). The library entry connects a process definition with the specific code (if any) in the compiled driver library.

The `status` indicates how far the process has been processed by the system (definition, code generation, compilation, linking). A process with status `STAT_LOADED` is accessible for computing matrix elements.

The `def` pointer identifies the corresponding process definition. The process component within that definition is identified by the `i_component` index.

The `i_external` index refers to the compiled library driver. If it is zero, there is no associated matrix-element code.

The `driver` component holds the pointers to the matrix-element specific functions, in particular the matrix element function itself.

```

<Process libraries: types>+≡
type :: process_library_entry_t
  private
  integer :: status = STAT_UNKNOWN
  type(process_def_t), pointer :: def => null ()
  integer :: i_component = 0
  integer :: i_external = 0
  class(prc_core_driver_t), allocatable :: driver
contains
  <Process libraries: process library entry: TBP>
end type process_library_entry_t

```

Here are the available status codes. An entry starts with `UNKNOWN` status. Once the association with a valid process definition is established, the status becomes

CONFIGURED. If matrix element source code is to be generated by the system or provided from elsewhere, `CODE_GENERATED` indicates that this is done. The `COMPILED` status is next, it also applies to processes which are accessed as pre-compiled binaries. Finally, the library is linked and process pointers are set; this is marked as `LOADED`.

For a process library, the initial status is `OPEN`, since process definitions may be added. After configuration, the process content is fixed and the status becomes `CONFIGURED`. The further states are as above, always referring to the lowest status among the process entries.

```
(Process libraries: parameters)≡
integer, parameter :: STAT_UNKNOWN = 0
integer, parameter :: STAT_OPEN = 1
integer, parameter :: STAT_CONFIGURED = 2
integer, parameter :: STAT_SOURCE = 3
integer, parameter :: STAT_COMPILED = 4
integer, parameter :: STAT_LINKED = 5
integer, parameter :: STAT_ACTIVE = 6
```

These are the associated code letters, for output:

```
(Process libraries: parameters)+≡
character, dimension(0:6), parameter :: STATUS_LETTER = &
["?", "o", "f", "s", "c", "l", "a"]
```

This produces a condensed account of the library entry. The status is indicated by a letter in brackets, then the ID and component index of the associated process definition, finally the library index, if available.

```
(Process libraries: process library entry: TBP)≡
procedure :: to_string => process_library_entry_to_string

(Process libraries: procedures)+≡
function process_library_entry_to_string (object) result (string)
type(string_t) :: string
class(process_library_entry_t), intent(in) :: object
character(32) :: buffer
string = "[" // STATUS_LETTER(object%status) // "]"
select case (object%status)
case (STAT_UNKNOWN)
case default
if (associated (object%def)) then
write (buffer, "(IO)") object%i_component
string = string // " " // object%def%id // "." // trim (buffer)
end if
if (object%i_external /= 0) then
write (buffer, "(IO)") object%i_external
string = string // " = ext:" // trim (buffer)
else
string = string // " = int"
end if
if (allocated (object%driver)) then
string = string // " (" // object%driver%type_name () // ")"
end if
end select
```

```
end function process_library_entry_to_string
```

Initialize with data. Used for the unit tests.

```
<Process libraries: process library entry: TBP>+≡
  procedure :: init => process_library_entry_init

<Process libraries: procedures>+≡
  subroutine process_library_entry_init (object, &
    status, def, i_component, i_external)
    class(process_library_entry_t), intent(out) :: object
    integer, intent(in) :: status
    type(process_def_t), target, intent(in) :: def
    integer, intent(in) :: i_component
    integer, intent(in) :: i_external
    object%status = status
    object%def => def
    object%i_component = i_component
    object%i_external = i_external
  end subroutine process_library_entry_init
```

Assign pointers for all process-specific features. We have to combine the method from the `core_def` specification, the assigned pointers within the library driver, the index within that driver, and the process driver which should receive the links.

```
<Process libraries: process library entry: TBP>+≡
  procedure :: connect => process_library_entry_connect

<Process libraries: procedures>+≡
  subroutine process_library_entry_connect (entry, lib_driver, i)
    class(process_library_entry_t), intent(inout) :: entry
    class(prclib_driver_t), intent(in) :: lib_driver
    integer, intent(in) :: i
    call entry%def%initial(entry%i_component)%connect &
      (lib_driver, i, entry%driver)
  end subroutine process_library_entry_connect
```

The process library object

The `process_library_t` type is an extension of the `process_def_list_t` type. Thus, it automatically contains the process definition list.

The `basename` identifies the library generically.

The `external` flag is true if any process within the library needs external code, so the library must correspond to an actual code library (statically or dynamically linked).

The `entry` array contains all process components that can be handled by this library. Each entry refers to the process (component) definition and to the associated external matrix element code, if there is any.

The `driver` object is needed only if `external` is true. This object handles all interactions with external matrix-element code.

The md5sum summarizes the complete process_def_list_t base object. It can be used to check if the library configuration has changed.

```

(Process libraries: public)+≡
    public :: process_library_t

(Process libraries: types)+≡
    type, extends (process_def_list_t) :: process_library_t
        private
        type(string_t) :: basename
        integer :: n_entries = 0
        logical :: external = .false.
        integer :: status = STAT_UNKNOWN
        logical :: static = .false.
        logical :: driver_exists = .false.
        logical :: makefile_exists = .false.
        type(process_library_entry_t), dimension(:), allocatable :: entry
        class(prclib_driver_t), allocatable :: driver
        character(32) :: md5sum = ""
    contains
    (Process libraries: process library: TBP)
    end type process_library_t

```

For the output, we write first the metadata and the DL access record, then the library entries in short form, and finally the process definition list which is the base object.

Don't write the MD5 sum since this is used to generate it.

```

(Process libraries: process library: TBP)≡

        lib%status = STAT_OPEN
        call msg_message ("Process library '" // char (basename) &
            // "': initialized")
    end subroutine process_library_init

```

This alternative initializer declares the library as static. We should now add process definitions to the library, but all external process code exists already.

We need the driver object, and we should check the defined processes against the stored ones.

```

(Process libraries: process library: TBP)+≡
  procedure :: init_static => process_library_init_static

(Process libraries: procedures)+≡
  subroutine process_library_init_static (lib, basename)
    class(process_library_t), intent(out) :: lib
    type(string_t), intent(in) :: basename
    lib%basename = basename
    lib%status = STAT_OPEN
    lib%static = .true.
    call msg_message ("Static process library '" // char (basename) &
      // "': initialized")
  end subroutine process_library_init_static

```

The `configure` procedure scans the allocated entries in the process definition list. The configuration proceeds in three passes.

In the first pass, we scan the process definition list and count the number of process components and the number of components which need external code. This is used to allocate the `entry` array.

In the second pass, we initialize the `entry` elements which connect process definitions, process driver objects, and external code.

In the third pass, we initialize the library driver object, allocating an entry for each external matrix element.

NOTE: Currently we handle only `initial` process components; `extra` components are ignored.

```

        end if
        lib%driver_exists = .true.
    end if
end subroutine process_library_write_driver

```

Update the compilation status of an external library.

Strictly speaking, this is not necessary for a one-time run, since the individual library methods will update the status themselves. However, it allows us to identify compilation steps that we can skip because the file exists or is already loaded, for the whole library or for particular entries.

Independently, the building process is controlled by a makefile. Thus, previous files are reused if they are not modified by the current compilation.

1. If it is not already loaded, attempt to load the library. If successful, check the overall MD5 sum. If it matches, just keep it loaded and mark as ACTIVE. If not, check the MD5 sum for all linked process components. Where it matches, mark the entry as COMPILED. Then, unload the library and mark as CONFIGURED.

Thus, we can identify compiled files for all matrix elements which are accessible via the previous compiled library, even if it is no longer up to date.

2. If the library is now in CONFIGURED state, look for valid source files. Each entry that is just in CONFIGURED state will advance to SOURCE if the MD5 sum matches. Finally, advance the whole library to SOURCE if all entries are at least in this condition.

```

(Process libraries: process library: TBP)+≡
  procedure :: update_status => process_library_update_status

(Process libraries: procedures)+≡
  subroutine process_library_update_status (lib, os_data)

            lib%status = STAT_SOURCE
        end if
    end if
end select
end if
end subroutine process_library_update_status

```

This procedure triggers code generation for all processes where this is possible.

We generate code only for external processes of status `STAT_CONFIGURED`, which then advance to `STAT_SOURCE`. If, for a particular process, the status is already advanced, we do not remove previous files, so `make` will consider them as up to date if they exist. Otherwise, we remove those files to force a fresh `make`.

Finally, if any source code has been generated, we need a driver file.

(Process libraries: process library: TBP)+≡

```

14.4.6 Test

This is the master for calling self-test procedures.

```

<Process libraries: public>+≡
    public :: process_libraries_test
<Process libraries: tests>≡
    subroutine process_libraries_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
    <Process libraries: execute tests>
    end subroutine process_libraries_test

```

Empty process list

Test 1: Write an empty process list.

```

<Process libraries: execute tests>≡
    call test (process_libraries_1, "process_libraries_1", &
        "empty process list", &
        u, results)
<Process libraries: tests>+≡
    subroutine process_libraries_1 (u)
        integer, intent(in) :: u
        type(process_def_list_t) :: process_def_list

        write (u, "(A)")  "* Test output: process_libraries_1"
        write (u, "(A)")  "* Purpose: Display an empty process definition list"
        write (u, "(A)")

        call process_def_list%write (u)

        write (u, "(A)")
        write (u, "(A)")  "* Test output end: process_libraries_1"
    end subroutine process_libraries_1

```

Process definition list

Test 2: Process definition list with processes and components. Construct the list, write to file, read it in again, and display. Finalize and delete the list after use.

We define a trivial 'test' type for the process variant. The test type contains just one (meaningless) data item, which is an integer.

```
<Process libraries: test declarations>≡
  type, extends (prc_core_def_t) :: prcdef_2_t
    integer :: data = 0
    logical :: file = .false.
  contains
    <Process libraries: prcdef 2: TBP>
  end type prcdef_2_t
```

The process variant is named 'test'.

```
<Process libraries: prcdef 2: TBP>≡
  procedure, nopass :: type_string => prcdef_2_type_string

<Process libraries: tests>+≡
  function prcdef_2_type_string () result (string)
    type(string_t) :: string
    string = "test"
  end function prcdef_2_type_string
```

Write the contents (the integer value).

```
<Process libraries: prcdef 2: TBP>+≡
  procedure :: write => prcdef_2_write

<Process libraries: tests>+≡
  subroutine prcdef_2_write (object, unit)
    class(prcdef_2_t), intent(in) :: object
    integer, intent(in) :: unit
    write (unit, "(3x,A,I0)") "Test data" = ", object%data"
  end subroutine prcdef_2_write
```

Recover the integer value.

```
<Process libraries: prcdef 2: TBP>+≡
  procedure :: read => prcdef_2_read

<Process libraries: tests>+≡
  subroutine prcdef_2_read (object, unit)
    class(prcdef_2_t), intent(out) :: object

Build workflow for test matrix element

Test 5: We write source code for a dummy process.

We define another trivial type for the process variant. The test type contains just no variable data, but produces code on file.

```

<Process libraries: test declarations>+≡
  type, extends (prc_core_def_t) :: prcdef_5_t
  contains
  <Process libraries: prcdef 5: TBP>
end type prcdef_5_t

```

The process variant is named `test_file`.

```

<Process libraries: prcdef 5: TBP>≡
  procedure, nopass :: type_string => prcdef_5_type_string

<Process libraries: tests>+≡
  function prcdef_5_type_string () result (string)
    type(string_t) :: string

```

```

        string = "test_file"
    end function prcdef_5_type_string

```

We reuse the writer `test_writer_4` from the previous module.

```

<Process libraries: prcdef 5: TBP>+≡
    procedure :: init => prcdef_5_init
<Process libraries: tests>+≡
    subroutine prcdef_5_init (object)
        class(prcdef_5_t), intent(out) :: object
        allocate (test_writer_4_t :: object%writer)
    end subroutine prcdef_5_init

```

Nothing to write.

```

<Process libraries: prcdef 5: TBP>+≡
    procedure :: write => prcdef_5_write
<Process libraries: tests>+≡
    subroutine prcdef_5_write (object, unit)
        class(prcdef_5_t), intent(in) :: object
        integer, intent(in) :: unit
    end subroutine prcdef_5_write

```

Nothing to read.

```

<Process libraries: prcdef 5: TBP>+≡
    procedure :: read => prcdef_5_read
<Process libraries: tests>+≡
    subroutine prcdef_5_read (object, unit)
        class(prcdef_5_t), intent(out) :: object
        integer, intent(in) :: unit
    end subroutine prcdef_5_read

```

Allocate the driver with the appropriate type.

```

<Process libraries: prcdef 5: TBP>+≡
    procedure :: allocate_driver => prcdef_5_allocate_driver
<Process libraries: tests>+≡
    subroutine prcdef_5_allocate_driver (object, driver, basename)
        class(prcdef_5_t), intent(in) :: object
        class(prc_core_driver_t), intent(out), allocatable :: driver
        type(string_t), intent(in) :: basename
        allocate (prctest_5_t :: driver)
    end subroutine prcdef_5_allocate_driver

```

This time we need code:

```

14.5 Process Library Stacks

For storing and handling multiple libraries, we define process library stacks. These are ordinary stacks where new entries are pushed onto the top.

```

<prclib_stacks.f90>≡
  <File header>

  module prclib_stacks

    <Use strings>
    use io_units
    use format_utils, only: write_separator

```

```

    use unit_tests
    use os_interface
    use process_libraries

    <Standard module head>

    <Prclib stacks: public>

    <Prclib stacks: types>

    contains

    <Prclib stacks: procedures>

    <Prclib stacks: tests>

    end module prclib_stacks

```

14.5.1 The stack entry type

A stack entry is a process library object, augmented by a pointer to the next entry. We do not need specific methods, all relevant methods are inherited.

On higher level, process libraries should be prepared as process entry objects.

```

<Prclib stacks: public>≡
    public :: prclib_entry_t

<Prclib stacks: types>≡
    type, extends (process_library_t) :: prclib_entry_t
        type(prclib_entry_t), pointer :: next => null ()
    end type prclib_entry_t

```

14.5.2 The prclib stack type

For easy conversion and lookup it is useful to store the filling number in the object. The content is stored as a linked list.

```

<Prclib stacks: public>+≡
    public :: prclib_stack_t

<Prclib stacks: types>+≡
    type :: prclib_stack_t
        integer :: n = 0
        type(prclib_entry_t), pointer :: first => null ()
    contains
        <Prclib stacks: prclib stack: TBP>
    end type prclib_stack_t

```

Finalizer. Iteratively deallocate the stack entries. The resulting empty stack can be immediately recycled, if necessary.

```

<Prclib stacks: prclib stack: TBP>≡
    procedure :: final => prclib_stack_final

```

```

<Prclib stacks: procedures>+=
  subroutine prclib_stack_final (object)
    class(prclib_stack_t), intent(inout) :: object
    type(prclib_entry_t), pointer :: lib
    do while (associated (object%first))
      lib => object%first
      object%first => lib%next
      call lib%final ()
      deallocate (lib)
    end do
    object%n = 0
  end subroutine prclib_stack_final

```

Output. The entries on the stack will be ordered LIFO, i.e., backwards.

```

<Prclib stacks: prclib stack: TBP>+=
  procedure :: write => prclib_stack_write

<Prclib stacks: procedures>+=
  subroutine prclib_stack_write (object, unit, libpath)
    class(prclib_stack_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: libpath
    type(prclib_entry_t), pointer :: lib
    integer :: u
    u = given_output_unit (unit)
    call write_separator (u, 2)
    select case (object%n)
    case (0)
      write (u, "(1x,A)") "Process library stack: [empty]"
    case default
      write (u, "(1x,A)") "Process library stack:"
      lib => object%first
      do while (associated (lib))
        call write_separator (u)
        call lib%write (u, libpath)
        lib => lib%next
      end do
    end select
    call write_separator (u, 2)
  end subroutine prclib_stack_write

```

14.5.3 Operating on Stacks

We take a library entry pointer and push it onto the stack. The previous pointer is nullified. Subsequently, the library entry is ‘owned’ by the stack and will be finalized when the stack is deleted.

```

<Prclib stacks: prclib stack: TBP>+=
  procedure :: push => prclib_stack_push

<Prclib stacks: procedures>+=
  subroutine prclib_stack_push (stack, lib)
    class(prclib_stack_t), intent(inout) :: stack

```

```

    type(prclib_entry_t), intent(inout), pointer :: lib
    lib%next => stack%first
    stack%first => lib
    lib => null ()
    stack%n = stack%n + 1
end subroutine prclib_stack_push

```

14.5.4 Accessing Contents

Return a pointer to the topmost stack element. The result type is just the bare `process_library_t`. There is no `target` attribute required since the stack elements are allocated via pointers.

```

<Prclib stacks: prclib stack: TBP>+≡
    procedure :: get_first_ptr => prclib_stack_get_first_ptr

<Prclib stacks: procedures>+≡
    function prclib_stack_get_first_ptr (stack) result (ptr)
        class(prclib_stack_t), intent(in) :: stack
        type(process_library_t), pointer :: ptr
        if (associated (stack%first)) then
            ptr => stack%first%process_library_t
        else
            ptr => null ()
        end if
    end function prclib_stack_get_first_ptr

```

Return a complete list of the libraries (names) in the stack. The list is in the order in which the elements got pushed onto the stack, so the 'first' entry is listed last.

```

<Prclib stacks: prclib stack: TBP>+≡
    procedure :: get_names => prclib_stack_get_names

<Prclib stacks: procedures>+≡
    subroutine prclib_stack_get_names (stack, libname)
        class(prclib_stack_t), intent(in) :: stack
        type(string_t), dimension(:), allocatable, intent(out) :: libname
        type(prclib_entry_t), pointer :: lib
        integer :: i
        allocate (libname (stack%n))
        i = stack%n
        lib => stack%first
        do while (associated (lib))
            libname(i) = lib%get_name ()
            i = i - 1
            lib => lib%next
        end do
    end subroutine prclib_stack_get_names

```

Return a pointer to the library with given name.

```

<Prclib stacks: prclib stack: TBP>+≡
    procedure :: get_library_ptr => prclib_stack_get_library_ptr

```

```

<Prclib stacks: procedures>+≡
function prclib_stack_get_library_ptr (stack, libname) result (ptr)
  class(prclib_stack_t), intent(in) :: stack
  type(string_t), intent(in) :: libname
  type(process_library_t), pointer :: ptr
  type(prclib_entry_t), pointer :: current
  current => stack%first
  do while (associated (current))
    if (current%get_name () == libname) then
      ptr => current%process_library_t
      return
    end if
    current => current%next
  end do
  ptr => null ()
end function prclib_stack_get_library_ptr

```

14.5.5 Unit tests

```

<Prclib stacks: public>+≡
public :: prclib_stacks_test

<Prclib stacks: tests>≡
subroutine prclib_stacks_test (u, results)
  integer, intent(in) :: u
  type(test_results_t), intent(inout) :: results
  <Prclib stacks: execute tests>
end subroutine prclib_stacks_test

```

Write an empty process library stack

The most trivial test is to write an uninitialized process library stack.

```

<Prclib stacks: execute tests>≡
call test (prclib_stacks_1, "prclib_stacks_1", &
  "write an empty process library stack", &
  u, results)

<Prclib stacks: tests>+≡
subroutine prclib_stacks_1 (u)
  integer, intent(in) :: u
  type(prclib_stack_t) :: stack

  write (u, "(A)")  "* Test output: prclib_stacks_1"
  write (u, "(A)")  "* Purpose: display an empty process library stack"
  write (u, "(A)")

  call stack%write (u)

  write (u, "(A)")
  write (u, "(A)")  "* Test output end: prclib_stacks_1"

end subroutine prclib_stacks_1

```

Fill a process library stack

Fill a process library stack with two (identical) processes.

```
(Prclib_stacks: execute tests)+≡
  call test (prclib_stacks_2, "prclib_stacks_2", &
    "fill a process library stack", &
    u, results)

(Prclib_stacks: tests)+≡
  subroutine prclib_stacks_2 (u)
    integer, intent(in) :: u
    type(prclib_stack_t) :: stack
    type(prclib_entry_t), pointer :: lib

```

14.6 Trivial matrix element for tests

For the purpose of testing the workflow, we implement here two matrix elements with the simplest possible structure.

This matrix element generator can only generate a single scattering process and a single decay process. The scattering process is a quartic interaction of a massless, neutral and colorless scalar s with unit coupling results in a trivial $2 \rightarrow 2$ scattering process. The matrix element is implemented internally, so we do not need the machinery of external process libraries. The decay process is a

decay of **s** into a pair of colored fermions **f**.

`procedure, nopass :: type_string => prc_test_def_type_string`

$\langle \text{Test ME: procedures} \rangle \equiv$

`function prc_test_def_type_string () result (string)`

```

        type(string_t) :: string
        string = "test_me"
    end function prc_test_def_type_string

```

There is no 'feature' here since there is no external code.

```

<Test ME: test me def: TBP>+≡
    procedure, nopass :: get_features => prc_test_def_get_features

<Test ME: procedures>+≡
    subroutine prc_test_def_get_features (features)
        type(string_t), dimension(:), allocatable, intent(out) :: features
        allocate (features (0))
    end subroutine prc_test_def_get_features

```

Initialization: set some data (not really useful).

```

<Test ME: test me def: TBP>+≡
    procedure :: init => prc_test_def_init

<Test ME: procedures>+≡
    subroutine prc_test_def_init (object, model_name, prt_in, prt_out)
        class(prc_test_def_t), intent(out) :: object
        type(string_t), intent(in) :: model_name
        type(string_t), dimension(:), intent(in) :: prt_in
        type(string_t), dimension(:), intent(in) :: prt_out
        object%model_name = model_name
        allocate (object%prt_in (size (prt_in)))
        object%prt_in = prt_in
        allocate (object%prt_out (size (prt_out)))
        object%prt_out = prt_out
    end subroutine prc_test_def_init

```

Write/read process- and method-specific data. (No-op)

```

<Test ME: test me def: TBP>+≡
    procedure :: write => prc_test_def_write

<Test ME: procedures>+≡
    subroutine prc_test_def_write (object, unit)
        class(prc_test_def_t), intent(in) :: object
        integer, intent(in) :: unit
    end subroutine prc_test_def_write

<Test ME: test me def: TBP>+≡
    procedure :: read => prc_test_def_read

<Test ME: procedures>+≡
    subroutine prc_test_def_read (object, unit)
        class(prc_test_def_t), intent(out) :: object
        integer, intent(in) :: unit
    end subroutine prc_test_def_read

```

Allocate the driver for test ME matrix elements. We get the actual component ID (basename), and we can transfer all process-specific data from the process definition.

```

<Test ME: test me def: TBP>+≡
  procedure :: allocate_driver => prc_test_def_allocate_driver

<Test ME: procedures>+≡
  subroutine prc_test_def_allocate_driver (object, driver, basename)
    class(prc_test_def_t), intent(in) :: object
    class(prc_core_driver_t), intent(out), allocatable :: driver
    type(string_t), intent(in) :: basename
    allocate (prc_test_t :: driver)
    select type (driver)
    type is (prc_test_t)
      driver%id = basename
      driver%model_name = object%model_name
      select case (size (object%prt_in))
      case (1); driver%scattering = .false.
      case (2); driver%scattering = .true.
      end select
    end select
  end subroutine prc_test_def_allocate_driver

```

Nothing to connect. This subroutine will not be called.

```

<Test ME: test me def: TBP>+≡
  procedure :: connect => prc_test_def_connect

<Test ME: procedures>+≡
  subroutine prc_test_def_connect (def, lib_driver, i, proc_driver)
    class(prc_test_def_t), intent(in) :: def
    class(prclib_driver_t), intent(in) :: lib_driver

14.6.4 Test

This is the master for calling self-test procedures.

```

<Test ME: public>+≡
public :: prc_test_test

```

```

<Test ME: tests>≡
  subroutine prc_test_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
    <Test ME: execute tests>
  end subroutine prc_test_test

```

Generate and load the scattering process

The process is $ss \rightarrow ss$, where s is a trivial scalar particle, for vanishing mass and unit coupling. We initialize the process, build the library, and compute the particular matrix element for momenta of unit energy and right-angle scattering. (The scattering is independent of angle.) The matrix element is equal to unity.

```

Chapter 15

Particles

This chapter collects modules that implement particle objects, for use in event records.

While within interactions, all correlations are manifest, a particle array is derived by selecting a particular quantum number set. This involves tracing over all other particles, as far as polarization is concerned. Thus, a particle has definite flavor, color, and a single-particle density matrix for polarization.

polarizations The polarization object is based on a `state_matrix_t` object. It describes the spin density matrix of a particle.

hepmc_interface Access particle objects of the HepMC package. Functional only if this package is linked.

lcio_interface Access objects of the LCIO package. Functional only if this package is linked.

particles Particle objects and particle lists, as the base of event records.

15.1 Polarization

Particle polarization is determined by a particular quantum state which has just helicity information. For defining polarizations, we adopt the phase convention for a spin-1/2 particle that

$$\rho = \frac{1}{2}(1 + \vec{\alpha} \cdot \vec{\sigma}) \quad (15.1)$$

with the polarization axis $\vec{\alpha}$. Using this, we define

1. Trivial polarization: $\vec{\alpha} = 0$. [This is unpolarized, but distinct from the particular undefined polarization matrix which has the same meaning.]
2. Circular polarization: $\vec{\alpha}$ points in $\pm z$ direction.
3. Transversal polarization: $\vec{\alpha}$ points orthogonal to the z direction, with a phase ϕ that is 0 for the x axis, and $\pi/2 = 90^\circ$ for the y axis. For antiparticles, the phase switches sign, corresponding to complex conjugation.
4. Axis polarization, where we explicitly give $\vec{\alpha}$.

For higher spin, we retain this definition, but apply it to the two components with maximum and minimum weight. For massless particles, this is sufficient. For massive particles, we add the possibilities:

5. Longitudinal polarization: Only the 0-component is set. This is possible only for bosons.
6. Diagonal polarization: Explicitly specify all components in the helicity basis.

Obviously, this does not exhaust the possible density matrices for higher spin, but it should cover all practical applications.

```

<Polarizations: public>

<Polarizations: types>

<Polarizations: interfaces>

contains

<Polarizations: procedures>

<Polarizations: tests>

end module polarizations

```

15.1.1 The polarization type

This is not an extension, but rather a restriction of the quantum state. Flavor and color are ignored, there is just a one-particle helicity density matrix.

```

<Polarizations: public>≡
    public :: polarization_t

<Polarizations: types>≡
    type :: polarization_t
        logical :: polarized = .false.
        integer :: spin_type = 0
        integer :: multiplicity = 0
        type(state_matrix_t) :: state
    end type polarization_t

```

15.1.2 Basic initializer and finalizer

We need the particle flavor for determining the allowed helicity values. The density matrix is not set, but prepared to be filled later. This is private.

```

<Polarizations: procedures>≡
    elemental subroutine polarization_init (pol, flv)
        type(polarization_t), intent(out) :: pol
        type(flavor_t), intent(in) :: flv
        pol%spin_type = flavor_get_spin_type (flv)
        pol%multiplicity = flavor_get_multiplicity (flv)
        call state_matrix_init (pol%state, store_values = .true.)
    end subroutine polarization_init

```

The finalizer has to be public. The quantum state contains memory allocated to pointers.

```

<Polarizations: public>+≡
    public :: polarization_final

<Polarizations: procedures>+≡
    elemental subroutine polarization_final (pol)
        type(polarization_t), intent(inout) :: pol
        call state_matrix_final (pol%state)
    end subroutine polarization_final

```

```
end subroutine polarization_final
```

15.1.3 I/O

```
<Polarizations: public>+≡
  public :: polarization_write

<Polarizations: procedures>+≡
  subroutine polarization_write (pol, unit)
    type(polarization_t), intent(in) :: pol
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit); if (u < 0) return
    write (u, "(1x,A,I1,A,I1,A)") &
      "Polarization: [spin_type = ", pol%spin_type, &
      ", mult = ", pol%multiplicity, "]"
    call state_matrix_write (pol%state, unit=unit)
  end subroutine polarization_write
```

Defined assignment: deep copy

```
<Polarizations: public>+≡
  public :: assignment(=)

<Polarizations: interfaces>≡
  interface assignment(=)
    module procedure polarization_assign
  end interface
```

```
<Polarizations: procedures>+≡
  subroutine polarization_assign (pol_out, pol_in)
    type(polarization_t), intent(out) :: pol_out
    type(polarization_t), intent(in) :: pol_in
    pol_out%polarized = pol_in%polarized
    pol_out%spin_type = pol_in%spin_type
    pol_out%multiplicity = pol_in%multiplicity
    pol_out%state = pol_in%state
  end subroutine polarization_assign
```

Binary I/O.

Note: currently disabled; state matrix raw I/O questionable.

```
<Polarizations: public>+≡
  public :: polarization_write_raw
  public :: polarization_read_raw

<Polarizations: procedures>+≡
  subroutine polarization_write_raw (pol, u)
    type(polarization_t), intent(in) :: pol
    integer, intent(in) :: u
    write (u) pol%polarized
    write (u) pol%spin_type
    write (u) pol%multiplicity
    if (state_matrix_is_defined (pol%state)) then
```

```

        call msg_bug ("Write polarization (raw): nontrivial state matrix not supported yet")
    else
        call state_matrix_write_raw (pol%state, u)
    end if
end subroutine polarization_write_raw

subroutine polarization_read_raw (pol, u, iostat)
    type(polarization_t), intent(out) :: pol

    call state_matrix_read_raw (pol%state, u, iostat=iostat)
end subroutine polarization_read_raw

```

15.1.4 Accessing contents

Return true if the particle is polarized. This is the case if the first (and only) entry in the quantum state has undefined helicity.

```

<Polarizations: public>+≡
    public :: polarization_is_polarized

<Polarizations: procedures>+≡
    elemental function polarization_is_polarized (pol) result (polarized)
        logical :: polarized
        type(polarization_t), intent(in) :: pol
        polarized = pol%polarized
    end function polarization_is_polarized

```

Return true if the polarization is diagonal, i.e., all entries in the density matrix are diagonal.

```

<Polarizations: public>+≡
    public :: polarization_is_diagonal

<Polarizations: interfaces>+≡
    interface polarization_is_diagonal
        module procedure polarization_is_diagonal0
        module procedure polarization_is_diagonal1
    end interface

<Polarizations: procedures>+≡
    function polarization_is_diagonal0 (pol) result (diagonal)
        logical :: diagonal
        type(polarization_t), intent(in) :: pol
        type(state_iterator_t) :: it
        diagonal = .true.
        call state_iterator_init (it, pol%state)
        do while (state_iterator_is_valid (it))
            diagonal = all (quantum_numbers_are_diagonal &
                (state_iterator_get_quantum_numbers (it)))
            if (.not. diagonal) exit
        end do
    end function polarization_is_diagonal0

```

```

        call state_iterator_advance (it)
    end do
end function polarization_is_diagonal0

function polarization_is_diagonal1 (pol) result (diagonal)
    type(polarization_t), dimension(:), intent(in) :: pol
    logical, dimension(size(pol)) :: diagonal
    integer :: i
    do i = 1, size (pol)
        diagonal(i) = polarization_is_diagonal0 (pol(i))
    end do
end function polarization_is_diagonal1

```

15.1.5 Initialization from state matrix

Here, the state matrix is already known (but not necessarily normalized). The result will be either unpolarized, or a normalized spin density matrix.

<Polarizations: public>+≡

```
public :: polarization_init_state_matrix
```

<Polarizations: procedures>+≡

```

subroutine polarization_init_state_matrix (pol, state)
    type(polarization_t), intent(out) :: pol
    type(state_matrix_t), intent(in), target :: state
    type(state_iterator_t) :: it
    type(flavor_t) :: flv
    type(helicity_t) :: hel
    type(quantum_numbers_t), dimension(1) :: qn
    complex(default) :: value, t
    call state_iterator_init (it, state)
    flv = state_iterator_get_flavor (it, 1)

call state_matrix_set_matrix_element (pol%state, value)
end subroutine polarization_init_trivial

```

The following three modes are useful mainly for spin-1/2 particle and massless particles of any nonzero spin. Only the highest-weight components are filled.

Circular polarization: The density matrix of the two highest-weight states is

$$\rho(f) = \frac{1-|f|}{2} \mathbf{1} + |f| \times \begin{cases} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}, & f > 0; \\ \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}, & f < 0, \end{cases}$$

If the polarization fraction $|f|$ is unity, we need only one entry in the density matrix.

<Polarizations: public>+≡

```
public :: polarization_init_circular
```

<Polarizations: procedures>+≡

```

subroutine polarization_init_circular (pol, flv, fraction)
  type(polarization_t), intent(out) :: pol
  type(flavor_t), intent(in) :: flv
  real(default), intent(in) :: fraction
  type(helicity_t), dimension(2) :: hel
  type(quantum_numbers_t), dimension(1) :: qn
  complex(default) :: value

```

```

integer :: hmax
call polarization_init (pol, flv)
pol%polarized = .true.
hmax = pol%spin_type / 2
call helicity_init (hel(1), hmax)
call helicity_init (hel(2), -hmax)
if (abs (fraction) /= 1) then
  value = (1 + fraction) / 2
  call quantum_numbers_init (qn(1), hel(1))
  call state_matrix_add_state (pol%state, qn, value=value)
  value = (1 - fraction) / 2
  call quantum_numbers_init (qn(1), hel(2))
  call state_matrix_add_state (pol%state, qn, value=value)
else
  value = abs (fraction)
  if (fraction > 0) then
    call quantum_numbers_init (qn(1), hel(1))
  else
    call quantum_numbers_init (qn(1), hel(2))
  end if
  call state_matrix_add_state (pol%state, qn, value=value)
end if
call state_matrix_freeze (pol%state)
end subroutine polarization_init_circular

```

Transversal polarization is analogous to circular, but we get a density matrix

$$\rho(f, \phi) = \frac{1 - |f|}{2} \mathbf{1} + \frac{|f|}{2} \begin{pmatrix} 1 & e^{-i\phi} \\ e^{i\phi} & 1 \end{pmatrix}.$$

The phase is $\phi = 0$ for the x -axis, $\phi = 90^\circ$ for the y axis as polarization vector. For an antiparticle, the phase switches sign, and for $f < 0$, the off-diagonal elements switch sign.

```

<Polarizations: public>+≡
  public :: polarization_init_transversal

<Polarizations: procedures>+≡
  subroutine polarization_init_transversal (pol, flv, phi, fraction)
    type(polarization_t), intent(inout) :: pol
    type(flavor_t), intent(in) :: flv
    real(default), intent(in) :: phi, fraction
    call polarization_init_axis &
      (pol, flv, fraction * [ cos (phi), sin (phi), 0._default])
  end subroutine polarization_init_transversal

```

For axis polarization, we again set only the entries with maximum weight.

$$\rho(f, \phi) = \frac{1}{2} \begin{pmatrix} 1 + \alpha_3 & \alpha_1 - i\alpha_2 \\ \alpha_1 + i\alpha_2 & 1 - \alpha_3 \end{pmatrix}.$$

For an antiparticle, α_2 switches sign (complex conjugate).

This version specifies the polarization axis in terms of r (polarization degree) and θ, ϕ (polar and azimuthal angles).

If one of the angles is a nonzero multiple of π , roundoff errors typically will result in tiny contributions to unwanted components. Therefore, include a catch for small numbers.

15.1.7 Operations

Combine polarization states by computing the outer product of the state matrices.

```

(Polarizations: public)+≡
    public :: combine_polarization_states

(Polarizations: procedures)+≡
    subroutine combine_polarization_states (pol, state)
        type(polarization_t), dimension(:), intent(in), target :: pol
        type(state_matrix_t), intent(out) :: state
        call outer_multiply (pol%state, state)
    end subroutine combine_polarization_states

```

Transform a polarization density matrix into a polarization vector. This is possible without information loss only for spin-1/2 and for massless particles. To get a unique answer in all cases, we consider only the components with highest weight. Obviously, this loses the longitudinal component of a massive vector, for instance.

This is the inverse operation of `polarization_init_axis` above, where the polarization fraction is set to unity.

```

        end if
    end subroutine polarization_to_angles

```

15.1.8 Sparse Matrix

We introduce a simpler implementation of a sparse matrix that should represent polarization. It consists of an integer array that represents the index values, and a complex array that represents the nonvanishing entries. The number of nonvanishing entries must be known for initialization, but the entries are filled one at a time.

This should eventually replace the more baroque polarization definition above, but in the first stage we introduce it just as an intermediage storage container.

Here is a base type without the special properties of a spin-density matrix.

```

<Polarizations: public>+≡
    public :: smatrix_t

```

```

<Polarizations: types>+≡
type :: smatrix_t
private
integer :: dim = 0
integer :: n_entry = 0
integer, dimension(:,:), allocatable :: index
complex(default), dimension(:), allocatable :: value
contains
<Polarizations: smatrix: TBP>
end type smatrix_t

```

Output.

```

<Polarizations: smatrix: TBP>≡
procedure :: write => smatrix_write

<Polarizations: procedures>+≡
subroutine smatrix_write (object, unit, indent)
class(smatrix_t), intent(in) :: object
integer, intent(in), optional :: unit, indent
integer :: u, i, ind
u = given_output_unit (unit)
ind = 0; if (present (indent)) ind = indent
if (allocated (object%value)) then
if (size (object%value) > 0) then
do i = 1, object%n_entry
write (u, "(1x,A,'@(')", advance="no") repeat (" ", ind)
write (u, "(SP,9999(I2.1,':',1x))", advance="no") &
object%index(:,i)
write (u, "('(', " // FMT_19 // ",','," // FMT_19 // &
",')')'") object%value(i)
end do
else
write (u, "(1x,A)", advance="no") repeat (" ", ind)
write (u, "(A)" " [empty matrix]"
end if
else
write (u, "(1x,A)", advance="no") repeat (" ", ind)
write (u, "(A)" " [undefined matrix]"
end if
end subroutine smatrix_write

```

Initialization: allocate arrays to the correct size. We specify both the dimension of the matrix (if different from two, this is rather a generic tensor) and the number of nonvanishing entries.

```

<Polarizations: smatrix: TBP>+≡
procedure :: init => smatrix_init

<Polarizations: procedures>+≡
subroutine smatrix_init (smatrix, dim, n_entry)
class(smatrix_t), intent(out) :: smatrix
integer, intent(in) :: dim
integer, intent(in) :: n_entry
smatrix%dim = dim
smatrix%n_entry = n_entry

```

```

        allocate (smatrix%index (dim, n_entry))
        allocate (smatrix%value (n_entry))
    end subroutine smatrix_init

```

Fill: one entry at a time.

```

<Polarizations: smatrix: TBP>+≡
    procedure :: set_entry => smatrix_set_entry

<Polarizations: procedures>+≡
    subroutine smatrix_set_entry (smatrix, i, index, value)
        class(smatrix_t), intent(inout) :: smatrix
        integer, intent(in) :: i
        integer, dimension(:), intent(in) :: index
        complex(default), intent(in) :: value
        smatrix%index(:,i) = index
        smatrix%value(i) = value
    end subroutine smatrix_set_entry

```

15.1.9 Polarization Matrix

As an extension of the more generic `smatrix` type, we implement a proper spin-density matrix. After the matrix has been filled, we can fix spin type and multiplicity for a particle, check the matrix for consistency, and normalize it if necessary.

```

<Polarizations: public>+≡
    public :: pmatrix_t

<Polarizations: types>+≡
    type, extends (smatrix_t) :: pmatrix_t
        private
        integer :: spin_type = 0
        integer :: multiplicity = 0
        logical :: massive = .true.
        integer :: chirality = 0
        real(default) :: degree = 1
        logical :: pure = .false.
    contains
        <Polarizations: pmatrix: TBP>
    end type pmatrix_t

```

Output, including extra data. (The `indent` argument is ignored.)

```

<Polarizations: pmatrix: TBP>≡
    procedure :: write => pmatrix_write

<Polarizations: procedures>+≡
    subroutine pmatrix_write (object, unit, indent)
        class(pmatrix_t), intent(in) :: object
        integer, intent(in), optional :: unit, indent
        integer :: u
        u = given_output_unit (unit)
        write (u, "(1x,A)") "Polarization: spin density matrix"
        write (u, "(3x,A,I0)") "spin type      = ", object%spin_type
    end subroutine pmatrix_write

```

```

write (u, "(3x,A,I0)") "multiplicity = ", object%multiplicity
write (u, "(3x,A,L1)") "massive      = ", object%massive
write (u, "(3x,A,I0)") "chirality   = ", object%chirality
write (u, "(3x,A,F10.7)") "pol.degree = ", object%degree
write (u, "(3x,A,L1)") "pure state  = ", object%pure
call object%smatrix_t%write (u, 1)
end subroutine pmatrix_write

```

This assignment is trivial, but must be coded explicitly.

```

<Polarizations: pmatrix: TBP>+≡
generic :: assignment(=) => pmatrix_assign_from_smatrix
procedure, private :: pmatrix_assign_from_smatrix

<Polarizations: procedures>+≡
subroutine pmatrix_assign_from_smatrix (pmatrix, smatrix)
class(pmatrix_t), intent(out) :: pmatrix
type(smatrix_t), intent(in)  :: smatrix
pmatrix%smatrix_t = smatrix
end subroutine pmatrix_assign_from_smatrix

```

Declare spin, multiplicity, and polarization degree. Check whether all entries fit, and whether this is a valid matrix.

The required properties are:

1. all entries apply to the given spin and mass type
2. the diagonal is real
3. only the upper of corresponding off-diagonal elements is specified, i.e., the row index is less than the column index
4. the trace is nonnegative and equal to the polarization degree (the remainder, proportional to the unit matrix, is understood to be present)
5. the trace of the matrix square is positive and less or equal to the trace of the matrix itself, which is the polarization degree. (If it is equal, we are dealing with a pure state).

```

15.2 HepMC events

This section provides the interface to the HepMC C++ library for handling Monte-Carlo events.

Each C++ class of HepMC that we use is mirrored by a Fortran type, which contains as its only component the C pointer to the C++ object.

Each C++ method of HepMC that we use has a C wrapper function. This function takes a pointer to the host object as its first argument. Further arguments are either C pointers, or in the case of simple types (integer, real), interoperable C/Fortran objects.

The C wrapper functions have explicit interfaces in the Fortran module. They are called by Fortran wrapper procedures. These are treated as methods of the corresponding Fortran type.

`<hepmc_interface.f90>`≡
<File header>

```

module hepmc_interface

    use, intrinsic :: iso_c_binding !NODEP!

<Use kinds>
<Use strings>
    use io_units
    use constants
    use lorentz
    use unit_tests
    use model_data
    use flavors
    use colors

```

```

    use helicities
    use quantum_numbers
    use polarizations

    <Standard module head>

    <HepMC interface: public>

    <HepMC interface: types>

    <HepMC interface: interfaces>

contains

    <HepMC interface: procedures>

    <HepMC interface: tests>

end module hepmc_interface

```

15.2.1 Interface check

This function can be called in order to verify that we are using the actual HepMC library, and not the dummy version.

```

<HepMC interface: interfaces>≡
    interface
        logical(c_bool) function hepmc_available () bind(C)
        import
        end function hepmc_available
    end interface

<HepMC interface: public>≡
    public :: hepmc_is_available

<HepMC interface: procedures>≡
    function hepmc_is_available () result (flag)
        logical :: flag
        flag = hepmc_available ()
    end function hepmc_is_available

```

15.2.2 FourVector

The C version of four-vectors is often transferred by value, and the associated procedures are all inlined. The wrapper needs to transfer by reference, so we create FourVector objects on the heap which have to be deleted explicitly. The input is a `vector4_t` or `vector3_t` object from the `lorentz` module.

```

<HepMC interface: public>+≡
    public :: hepmc_four_vector_t

<HepMC interface: types>≡
    type :: hepmc_four_vector_t
    private
    type(c_ptr) :: obj

```

```
end type hepmc_four_vector_t
```

In the C constructor, the zero-component (fourth argument) is optional; if missing, it is set to zero. The Fortran version has initializer form and takes either a three-vector or a four-vector. A further version extracts the four-vector from a HepMC particle object.

```
<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_four_vector_xyz (x, y, z) bind(C)

15.2.3 Polarization

Polarization objects are temporarily used for assigning particle polarization. We add a flag `polarized`. If this is false, the polarization is not set and should not be transferred to `hepmc_particle` objects.

```

<HepMC interface: public>+≡
  public :: hepmc_polarization_t

<HepMC interface: types>+≡
  type :: hepmc_polarization_t
  private
  logical :: polarized = .false.
  type(c_ptr) :: obj
  end type hepmc_polarization_t

```

Constructor. The C wrapper takes polar and azimuthal angle as arguments. The Fortran version allows for either a complete polarization density matrix, or for a definite (diagonal) helicity.

HepMC does not allow to specify the degree of polarization, therefore we have to map it to either 0 or 1. We choose 0 for polarization less than 0.5 and 1 for polarization greater than 0.5. Even this simplification works only for spin-1/2 and for massless particles; massive vector bosons cannot be treated this way. In particular, zero helicity is always translated as unpolarized.

For massive vector bosons, we arbitrarily choose the convention that the longitudinal (zero) helicity state is mapped to the theta angle $\pi/2$. This works under the condition that helicity is projected onto one of the basis states.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_polarization (theta, phi) bind(C)
      import
      real(c_double), value :: theta, phi
    end function new_polarization

end function hepmc_particle_get_color

```

15.2.5 GenVertex

Vertices are made of particles (incoming and outgoing).

```

<HepMC interface: public>+≡
public :: hepmc_vertex_t

```

```

<HepMC interface: types>+≡
  type :: hepmc_vertex_t
  private
  type(c_ptr) :: obj
end type hepmc_vertex_t

```

Constructor. Two versions, one plain, one with the position in space and time (measured in mm) as argument. The Fortran version has initializer form, and the vertex position is an optional argument.

A destructor is unnecessary as long as all vertices are entered into an event container.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_gen_vertex () bind(C)
    import
    end function new_gen_vertex
  end interface
  interface

  end function hepmc_vertex_get_n_out

```

15.2.6 Vertex-particle-in iterator

This iterator iterates over all incoming particles in an vertex. We store a pointer to the vertex in addition to the iterator. This allows for simple end checking.

The iterator is actually a constant iterator; it can only read.

```

<HepMC interface: public>+≡
  public :: hepmc_vertex_particle_in_iterator_t
<HepMC interface: types>+≡
  type :: hepmc_vertex_particle_in_iterator_t
  private
  type(c_ptr) :: obj
  type(c_ptr) :: v_obj
  end type hepmc_vertex_particle_in_iterator_t

```

Constructor. The iterator is initialized at the first particle in the vertex.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function &
      new_vertex_particles_in_const_iterator (v_obj) bind(C)
    import
    type(c_ptr), value :: v_obj
  end function new_vertex_particles_in_const_iterator
  end interface
<HepMC interface: public>+≡
  public :: hepmc_vertex_particle_in_iterator_init
<HepMC interface: procedures>+≡
  subroutine hepmc_vertex_particle_in_iterator_init (it, v)
    type(hepmc_vertex_particle_in_iterator_t), intent(out) :: it
    type(hepmc_vertex_t), intent(in) :: v
    it%obj = new_vertex_particles_in_const_iterator (v%obj)
    it%v_obj = v%obj
  end subroutine hepmc_vertex_particle_in_iterator_init

```

Destructor. Necessary because the iterator is allocated on the heap.

```
<HepMC interface: interfaces>+≡
  interface
    subroutine vertex_particles_in_const_iterator_delete (it_obj) bind(C)
    import
    type(c_ptr), value :: it_obj
    end subroutine vertex_particles_in_const_iterator_delete
  end interface

<HepMC interface: public>+≡
  public :: hepmc_vertex_particle_in_iterator_final

<HepMC interface: procedures>+≡
  subroutine hepmc_vertex_particle_in_iterator_final (it)
    type(hepmc_vertex_particle_in_iterator_t), intent(inout) :: it
    call vertex_particles_in_const_iterator_delete (it%obj)
  end subroutine hepmc_vertex_particle_in_iterator_final
```

Increment

```
<HepMC interface: interfaces>+≡
  interface
    subroutine vertex_particles_in_const_iterator_advance (it_obj) bind(C)
    import
    type(c_ptr), value :: it_obj
    end subroutine vertex_particles_in_const_iterator_advance
  end interface

<HepMC interface: public>+≡
  public :: hepmc_vertex_particle_in_iterator_advance

<HepMC interface: procedures>+≡
  subroutine hepmc_vertex_particle_in_iterator_advance (it)
    type(hepmc_vertex_particle_in_iterator_t), intent(inout) :: it
    call vertex_particles_in_const_iterator_advance (it%obj)
  end subroutine hepmc_vertex_particle_in_iterator_advance
```

Reset to the beginning

```
<HepMC interface: interfaces>+≡
  interface
    subroutine vertex_particles_in_const_iterator_reset &
      (it_obj, v_obj) bind(C)
    import
    type(c_ptr), value :: it_obj, v_obj
    end subroutine vertex_particles_in_const_iterator_reset
  end interface

end subroutine gen_event_set_cross_section
end interface

```

15.2.9 Event-particle iterator

This iterator iterates over all particles in an event. We store a pointer to the event in addition to the iterator. This allows for simple end checking.

The iterator is actually a constant iterator; it can only read.

```

<HepMC interface: public>+≡
  public :: hepmc_event_particle_iterator_t

<HepMC interface: types>+≡
  type :: hepmc_event_particle_iterator_t
  private
  type(c_ptr) :: obj
  type(c_ptr) :: evt_obj
end type hepmc_event_particle_iterator_t

```

Constructor. The iterator is initialized at the first particle in the event.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_event_particle_const_iterator (evt_obj) bind(C)
    import
    type(c_ptr), value :: evt_obj
    end function new_event_particle_const_iterator
  end interface

<HepMC interface: public>+≡
  public :: hepmc_event_particle_iterator_init

<HepMC interface: procedures>+≡
  subroutine hepmc_event_particle_iterator_init (it, evt)
    type(hepmc_event_particle_iterator_t), intent(out) :: it
    type(hepmc_event_t), intent(in) :: evt
    it%obj = new_event_particle_const_iterator (evt%obj)
    it%evt_obj = evt%obj
  end subroutine hepmc_event_particle_iterator_init

```

Destructor. Necessary because the iterator is allocated on the heap.

```

<HepMC interface: interfaces>+≡
  interface
    subroutine event_particle_const_iterator_delete (it_obj) bind(C)
    import
    type(c_ptr), value :: it_obj
    end subroutine event_particle_const_iterator_delete
  end interface

<HepMC interface: public>+≡
  public :: hepmc_event_particle_iterator_final

```

```

<HepMC interface: procedures>+≡
  subroutine hepmc_event_particle_iterator_final (it)
    type(hepmc_event_particle_iterator_t), intent(inout) :: it
    call event_particle_const_iterator_delete (it%obj)
  end subroutine hepmc_event_particle_iterator_final

```

Increment

```

<HepMC interface: interfaces>+≡
  interface
    subroutine event_particle_const_iterator_advance (it_obj) bind(C)
      import
      type(c_ptr), value :: it_obj
    end subroutine event_particle_const_iterator_advance
  end interface

```

```

<HepMC interface: public>+≡
  public :: hepmc_event_particle_iterator_advance

```

```

<HepMC interface: procedures>+≡
  subroutine hepmc_event_particle_iterator_advance (it)
    type(hepmc_event_particle_iterator_t), intent(inout) :: it
    call event_particle_const_iterator_advance (it%obj)
  end subroutine hepmc_event_particle_iterator_advance

```

Reset to the beginning

```

<HepMC interface: interfaces>+≡
  interface
    subroutine event_particle_const_iterator_reset (it_obj, evt_obj) bind(C)
      import
      type(c_ptr), value :: it_obj, evt_obj
    end subroutine event_particle_const_iterator_reset
  end interface

```

```

<HepMC interface: public>+≡
  public :: hepmc_event_particle_iterator_reset

```

```

<HepMC interface: procedures>+≡
  subroutine hepmc_event_particle_iterator_reset (it)
    type(hepmc_event_particle_iterator_t), intent(inout) :: it
    call event_particle_const_iterator_reset (it%obj, it%evt_obj)
  end subroutine hepmc_event_particle_iterator_reset

```

Test: return true as long as we are not past the end.

```

<HepMC interface: interfaces>+≡
  interface
    function event_particle_const_iterator_is_valid &
      (it_obj, evt_obj) result (flag) bind(C)
      import
      logical(c_bool) :: flag
      type(c_ptr), value :: it_obj, evt_obj
    end function event_particle_const_iterator_is_valid
  end interface

```

```

<HepMC interface: public>+≡
  public :: hepmc_event_particle_iterator_is_valid

```

```

<HepMC interface: procedures>+≡
function hepmc_event_particle_iterator_is_valid (it) result (flag)
  logical :: flag
  type(hepmc_event_particle_iterator_t), intent(in) :: it
  flag = event_particle_const_iterator_is_valid (it%obj, it%evt_obj)
end function hepmc_event_particle_iterator_is_valid

```

Return the particle pointed to by the iterator. (The particle object should not be finalized, since it contains merely a pointer to the particle which is owned by the vertex.)

```

<HepMC interface: interfaces>+≡
interface
  type(c_ptr) function event_particle_const_iterator_get (it_obj) bind(C)
  import
    type(c_ptr), value :: it_obj
  end function event_particle_const_iterator_get
end interface

```

```

<HepMC interface: public>+≡
public :: hepmc_event_particle_iterator_get

```

```

<HepMC interface: procedures>+≡
function hepmc_event_particle_iterator_get (it) result (prt)
  type(hepmc_particle_t) :: prt
  type(hepmc_event_particle_iterator_t), intent(in) :: it
  prt%obj = event_particle_const_iterator_get (it%obj)
end function hepmc_event_particle_iterator_get

```

15.2.10 I/O streams

There is a specific I/O stream type for handling the output of GenEvent objects (i.e., Monte Carlo event samples) to file. Opening the file is done by the constructor, closing by the destructor.

```

<HepMC interface: public>+≡
public :: hepmc_iostream_t

```

```

<HepMC interface: types>+≡
type :: hepmc_iostream_t
private
  type(c_ptr) :: obj
end type hepmc_iostream_t

```

Constructor for an output stream associated to a file.

```

<HepMC interface: interfaces>+≡
interface
  type(c_ptr) function new_io_gen_event_out (filename) bind(C)
  import
    character(c_char), dimension(*), intent(in) :: filename
  end function new_io_gen_event_out
end interface

```

```

<HepMC interface: public>+≡
public :: hepmc_iostream_open_out

```

```

<HepMC interface: procedures>+≡
  subroutine hepmc_iostream_open_out (iostream, filename)
    type(hepmc_iostream_t), intent(out) :: iostream
    type(string_t), intent(in) :: filename
    iostream%obj = new_io_gen_event_out (char (filename) // c_null_char)
  end subroutine hepmc_iostream_open_out

```

Constructor for an input stream associated to a file.

```

<HepMC interface: interfaces>+≡
  interface
    type(c_ptr) function new_io_gen_event_in (filename) bind(C)
    import
      character(c_char), dimension(*), intent(in) :: filename
    end function new_io_gen_event_in
  end interface

<HepMC interface: public>+≡
  public :: hepmc_iostream_open_in

<HepMC interface: procedures>+≡
  subroutine hepmc_iostream_open_in (iostream, filename)
    type(hepmc_iostream_t), intent(out) :: iostream
    type(string_t), intent(in) :: filename
    iostream%obj = new_io_gen_event_in (char (filename) // c_null_char)
  end subroutine hepmc_iostream_open_in

```

Destructor:

```

<HepMC interface: interfaces>+≡
  interface
    subroutine io_gen_event_delete (io_obj) bind(C)
    import
      type(c_ptr), value :: io_obj
    end subroutine io_gen_event_delete
  end interface

<HepMC interface: public>+≡
  public :: hepmc_iostream_close

<HepMC interface: procedures>+≡
  subroutine hepmc_iostream_close (iostream)
    type(hepmc_iostream_t), intent(inout) :: iostream
    call io_gen_event_delete (iostream%obj)
  end subroutine hepmc_iostream_close

```

Write a single event to the I/O stream.

```

<HepMC interface: interfaces>+≡
  interface
    subroutine io_gen_event_write_event (io_obj, evt_obj) bind(C)
    import
      type(c_ptr), value :: io_obj, evt_obj
    end subroutine io_gen_event_write_event
  end interface

<HepMC interface: public>+≡
  public :: hepmc_iostream_write_event

```

```

<HepMC interface: procedures>+≡
  subroutine hepmc_iostream_write_event (iostream, evt)
    type(hepmc_iostream_t), intent(inout) :: iostream
    type(hepmc_event_t), intent(in) :: evt
    call io_gen_event_write_event (iostream%obj, evt%obj)
  end subroutine hepmc_iostream_write_event

```

Read a single event from the I/O stream. Return true if successful.

```

<HepMC interface: interfaces>+≡
  interface
    logical(c_bool) function io_gen_event_read_event (io_obj, evt_obj) bind(C)
    import
    type(c_ptr), value :: io_obj, evt_obj
    end function io_gen_event_read_event
  end interface

```

```

<HepMC interface: public>+≡
  public :: hepmc_iostream_read_event

```

```

<HepMC interface: procedures>+≡
  subroutine hepmc_iostream_read_event (iostream, evt, ok)
    type(hepmc_iostream_t), intent(inout) :: iostream
    type(hepmc_event_t), intent(inout) :: evt
    logical, intent(out) :: ok
    ok = io_gen_event_read_event (iostream%obj, evt%obj)
  end subroutine hepmc_iostream_read_event

```

15.2.11 Unit tests

This test example is an abridged version from the build-from-scratch example in the HepMC distribution. We create two vertices for $p \rightarrow q$ PDF splitting, then a vertex for a $qq \rightarrow W^-g$ hard-interaction process, and finally a vertex for $W^- \rightarrow qq$ decay. The setup is for LHC kinematics.

Extending the original example, we set color flow for the incoming quarks and polarization for the outgoing photon. For the latter, we have to define a particle-data object for the photon, so a flavor object can be correctly initialized.

```

<HepMC interface: public>+≡
  public :: hepmc_test

<HepMC interface: procedures>+≡
  subroutine hepmc_test (u, results)

15.3 LCIO events

This section provides the interface to the LCIO C++ library for handling Monte-Carlo events.

Each C++ class of LCIO that we use is mirrored by a Fortran type, which

contains as its only component the C pointer to the C++ object.

Each C++ method of LCIO that we use has a C wrapper function. This function takes a pointer to the host object as its first argument. Further arguments are either C pointers, or in the case of simple types (integer, real), interoperable C/Fortran objects.

The C wrapper functions have explicit interfaces in the Fortran module. They are called by Fortran wrapper procedures. These are treated as methods of the corresponding Fortran type.

```

<lcio_interface.f90>≡
  <File header>

  module lcio_interface

    use, intrinsic :: iso_c_binding !NODEP!

    <Use kinds>
    <Use strings>
    use io_units
    !! use constants
    use lorentz
    !! use unit_tests
    !! use model_data
    !! use flavors
    use colors
    !! use helicities
    !! use quantum_numbers
    !! use polarizations

    <Standard module head>

    <LCIO interface: public>

    <LCIO interface: types>

    <LCIO interface: interfaces>

    contains

    <LCIO interface: procedures>

    <LCIO interface: tests>

  end module lcio_interface

```

15.3.1 Interface check

This function can be called in order to verify that we are using the actual LCIO library, and not the dummy version.

```

<LCIO interface: interfaces>≡
  interface
    logical(c_bool) function lcio_available () bind(C)
    import

```

```

        end function lcio_available
    end interface

    <LCIO interface: public>≡
        public :: lcio_is_available

    <LCIO interface: procedures>≡
        function lcio_is_available () result (flag)
            logical :: flag
            flag = lcio_available ()
        end function lcio_is_available

```

15.3.2 LCIO Run Header

This is a type for the run header of the LCIO file.

```

    <LCIO interface: public>+≡
        public :: lcio_run_header_t

    <LCIO interface: types>≡
        type :: lcio_run_header_t
        private
        type(c_ptr) :: obj
        end type lcio_run_header_t

```

The Fortran version has initializer form.

```

    <LCIO interface: interfaces>+≡
        interface
            type(c_ptr) function new_lcio_run_header (proc_id) bind(C)
                import
                integer(c_int), value :: proc_id
            end function new_lcio_run_header
        end interface

    <LCIO interface: public>+≡
        public :: lcio_run_header_init

    <LCIO interface: procedures>+≡
        subroutine lcio_run_header_init (runhdr, proc_id)
            type(lcio_run_header_t), intent(out) :: runhdr

            integer(c_int) :: pid
            pid = 0; if (present (proc_id)) pid = proc_id
            runhdr%obj = new_lcio_run_header (pid)
        end subroutine lcio_run_header_init

```

15.3.3 LCIO Event

The main object of LCIO is a LCEventImpl. The object is filled by MCParticle objects, which are set as LCCollection.

```

    <LCIO interface: public>+≡
        public :: lcio_event_t

```

```

<LCIO interface: types>+≡
  type :: lcio_event_t
  private
    type(c_ptr) :: obj
  end type lcio_event_t

```

Constructor. Arguments are process ID (integer) and event ID (integer).
The Fortran version has initializer form.

```

<LCIO interface: interfaces>+≡
  interface
    type(c_ptr) function new_lcio_event (proc_id, event_id) bind(C)
    import
      integer(c_int), value :: proc_id, event_id
    end function new_lcio_event
  end interface

<LCIO interface: public>+≡
  public :: lcio_event_init

<LCIO interface: procedures>+≡
  subroutine lcio_event_init (evt, proc_id, event_id)
    type(lcio_event_t), intent(out) :: evt
    integer, intent(in), optional :: proc_id, event_id
    integer(c_int) :: pid, eid
    pid = 0; if (present (proc_id)) pid = proc_id
    eid = 0; if (present (event_id)) eid = event_id
    evt%obj = new_lcio_event (pid, eid)
  end subroutine lcio_event_init

```

Destructor.

```

<LCIO interface: interfaces>+≡
  interface
    subroutine lcio_event_delete (evt_obj) bind(C)
    import
      type(c_ptr), value :: evt_obj
    end subroutine lcio_event_delete
  end interface

<LCIO interface: public>+≡
  public :: lcio_event_final

<LCIO interface: procedures>+≡

    type(lcio_event_t), intent(inout) :: evt
    call lcio_event_delete (evt%obj)
  end subroutine lcio_event_final

```

15.3.4 LCIO Particle

Particle objects have the obvious meaning.

```

<LCIO interface: public>+≡
  public :: lcio_particle_t

```

```

<LCIO interface: types>+≡
  type :: lcio_particle_t
  private
    type(c_ptr) :: obj
  end type lcio_particle_t

```

Constructor. Do we need a destructor?

```

<LCIO interface: interfaces>+≡
  interface
    type(c_ptr) function new_lcio_particle (mom, pdg_id, mass, status) bind(C)
    import
      integer(c_int), value :: pdg_id, status
      real(c_double), value :: mass
      real(c_double), dimension(3) :: mom
    end function new_lcio_particle
  end interface

```

```

<LCIO interface: public>+≡
  public :: lcio_particle_init

```

```

<LCIO interface: procedures>+≡
  subroutine lcio_particle_init (prt, p, pdg, status, mass)
    type(lcio_particle_t), intent(out) :: prt
    type(vector4_t), intent(in) :: p

    real(default) :: px, py, pz
    integer, intent(in) :: pdg, status
    px = vector4_get_component (p, 1)
    py = vector4_get_component (p, 2)
    pz = vector4_get_component (p, 3)
    prt%obj = new_lcio_particle ([real (px, c_double), real (py, c_double), &
      real (pz, c_double)], int (pdg, c_int), &
      real (mass, c_double), int (status, c_int))
  end subroutine lcio_particle_init

```

Set the particle color flow.

```

<LCIO interface: interfaces>+≡
  interface
    subroutine lcio_set_color_flow (prt_obj, col) bind(C)
    import
      type(c_ptr), intent(inout) :: prt_obj
      integer(c_int), dimension(2), intent(in) :: col
    end subroutine lcio_set_color_flow
  end interface

```

Set the particle color. Either from a color_t object or directly from a pair of integers.

```

<LCIO interface: interfaces>+≡
  interface lcio_particle_set_color
    module procedure lcio_particle_set_color_col
    module procedure lcio_particle_set_color_int
  end interface lcio_particle_set_color

```

```

<LCIO interface: public>+≡
  public :: lcio_particle_set_color

```

```

<LCIO interface: procedures>+≡
  subroutine lcio_particle_set_color_col (prt, col)
    type(lcio_particle_t), intent(inout) :: prt
    type(color_t), intent(in) :: col
    integer(c_int), dimension(2) :: c
    c(1) = color_get_col (col)
    c(2) = color_get_acl (col)
    if (c(1) /= 0 .and. c(2) /= 0) then
      call lcio_set_color_flow (prt%obj, c)
    end if
  end subroutine lcio_particle_set_color_col

  subroutine lcio_particle_set_color_int (prt, col)
    type(lcio_particle_t), intent(inout) :: prt
    integer, dimension(2), intent(in) :: col
    integer(c_int), dimension(2) :: c
    c = col
    if (c(1) /= 0 .and. c(2) /= 0) then
      call lcio_set_color_flow (prt%obj, c)
    end if
  end subroutine lcio_particle_set_color_int

```

Return the particle color as a two-dimensional array (color, anticolor).

```

<LCIO interface: interfaces>+≡
  interface
    subroutine lcio_particle_get_flow (prt_obj, flow) bind(C)
      import
      type(c_ptr), intent(in), value :: prt_obj
      integer(c_int), dimension(2), intent(out) :: flow
    end subroutine lcio_particle_get_flow
  end interface

<LCIO interface: public>+≡
  public :: lcio_particle_get_color

<LCIO interface: procedures>+≡
  function lcio_particle_get_color (prt) result (col)
    integer, dimension(2) :: col
    type(lcio_particle_t), intent(in) :: prt
    call lcio_particle_get_flow (prt%obj, col)
  end function lcio_particle_get_color

```

15.3.5 LCIO Writer type

There is a specific LCIO Writer type for handling the output of LCEventImpl objects (i.e., Monte Carlo event samples) to file. Opening the file is done by the constructor, closing by the destructor.

```

<LCIO interface: public>+≡
  public :: lcio_writer_t

<LCIO interface: types>+≡
  type :: lcio_writer_t
  private

```

```

    type(c_ptr) :: obj
end type lcio_writer_t

```

Constructor for an output associated to a file.

```

<LCIO interface: interfaces>+≡
interface
    type(c_ptr) function open_lcio_writer_new (filename) bind(C)
    import
    character(c_char), dimension(*), intent(in) :: filename
    end function open_lcio_writer_new
end interface

<LCIO interface: public>+≡
public :: lcio_writer_open_out

<LCIO interface: procedures>+≡
subroutine lcio_writer_open_out (lcio_writer, filename)
    type(lcio_writer_t), intent(out) :: lcio_writer
    type(string_t), intent(in) :: filename
    lcio_writer%obj = open_lcio_writer_new (char (filename) // c_null_char)
end subroutine lcio_writer_open_out

```

Destructor:

```

<LCIO interface: interfaces>+≡
interface
    subroutine lcio_writer_delete (io_obj) bind(C)
    import
    type(c_ptr), value :: io_obj
    end subroutine lcio_writer_delete
end interface

<LCIO interface: public>+≡
public :: lcio_writer_close

<LCIO interface: procedures>+≡
subroutine lcio_writer_close (lciowriter)
    type(lcio_writer_t), intent(inout) :: lciowriter
    call lcio_writer_delete (lciowriter%obj)
end subroutine lcio_writer_close

```

Write a single event to the LCIO writer.

```

<LCIO interface: interfaces>+≡
interface
    subroutine lcio_write_event (io_obj, evt_obj) bind(C)
    import
    type(c_ptr), value :: io_obj, evt_obj
    end subroutine lcio_write_event
end interface

<LCIO interface: public>+≡
public :: lcio_event_write

```

```

<LCIO interface: procedures>+≡
  subroutine lcio_event_write (wrt, evt)
    type(lcio_writer_t), intent(inout) :: wrt
    type(lcio_event_t), intent(in) :: evt
    call lcio_write_event (wrt%obj, evt%obj)
  end subroutine lcio_event_write

```

15.4 Particles

This module defines the `particle_t` object type, and the methods and operations that deal with it.

```

<particles.f90>≡
  <File header>

```

```

  module particles

```

```

    <Use kinds>

```

```

```

```

    <Particles: parameters>

```

```

    <Particles: types>

```

```

    <Particles: interfaces>

```

```

  contains

```

```

    <Particles: procedures>

```

```
⟨Particles: tests⟩
```

```
end module particles
```

15.4.1 The particle type

Particle status codes

The overall status codes (incoming/outgoing etc.) are inherited from the module `subevents`.

Polarization status:

```
⟨Particles: parameters⟩≡
```

```
integer, parameter, public :: PRT_UNPOLARIZED = 0
integer, parameter, public :: PRT_DEFINITE_HELICITY = 1
integer, parameter, public :: PRT_GENERIC_POLARIZATION = 2
```

Definition

The quantum numbers are flavor (from which invariant particle properties can be derived), color, and polarization. The particle may be unpolarized. In this case, `hel` and `pol` are unspecified. If it has a definite helicity, the `hel` component is defined. If it has a generic polarization, the `pol` component is defined. For each particle we store the four-momentum and the invariant mass squared, i.e., the squared norm of the four-momentum. There is also an optional list of parent and child particles, for bookkeeping in physical events.

```
⟨Particles: public⟩≡
```

```
public :: particle_t
```

```
⟨Particles: types⟩≡
```

```
type :: particle_t
private
integer :: status = PRT_UNDEFINED
integer :: polarization = PRT_UNPOLARIZED
type(flavor_t) :: flv
type(color_t) :: col
type(helicity_t) :: hel
type(polarization_t) :: pol
type(vector4_t) :: p = vector4_null
real(default) :: p2 = 0
integer, dimension(:), allocatable :: parent
integer, dimension(:), allocatable :: child
end type particle_t
```

Particle initializers:

```
⟨Particles: interfaces⟩≡
```

```
interface particle_init
module procedure particle_init_particle
module procedure particle_init_state
module procedure particle_init_hepmc
end interface
```

Copy a particle. (Deep copy) The excludes the parent-child relations.

(Particles: procedures)≡

```

subroutine particle_init_particle (prt_out, prt_in)
  type(particle_t), intent(out) :: prt_out
  type(particle_t), intent(in) :: prt_in
  prt_out%status = prt_in%status
  prt_out%polarization = prt_in%polarization
  prt_out%flv = prt_in%flv
  prt_out%col = prt_in%col
  prt_out%hel = prt_in%hel
  prt_out%pol = prt_in%pol
  prt_out%p = prt_in%p
  prt_out%p2 = prt_in%p2
end subroutine particle_init_particle

```

Initialize a particle using a single-particle state matrix which determines flavor, color, and polarization. The state matrix must have unique flavor and color. The factorization mode determines whether the particle is unpolarized, has definite helicity, or generic polarization. This mode is translated into the polarization status.

(Particles: procedures)+≡

```

subroutine particle_init_state (prt, state, status, mode)
  type(particle_t), intent(out) :: prt
  type(state_matrix_t), intent(in) :: state
  integer, intent(in) :: status, mode
  type(state_iterator_t) :: it
  prt%status = status
  call state_iterator_init (it, state)
  prt%flv = state_iterator_get_flavor (it, 1)
  if (flavor_is_beam_remnant (prt%flv)) prt%status = PRT_BEAM_REMNANT
  prt%col = state_iterator_get_color (it, 1)
  select case (mode)
    case (FM_SELECT_HELICITY)
      prt%hel = state_iterator_get_helicity (it, 1)
      prt%polarization = PRT_DEFINITE_HELICITY
    case (FM_FACTOR_HELICITY)
      call polarization_init_state_matrix (prt%pol, state)
      prt%polarization = PRT_GENERIC_POLARIZATION
  end select
end subroutine particle_init_state

```

Initialize a particle from a HepMC particle object. The model is necessary for making a fully qualified flavor component. We have the additional flag **polarized** which tells whether the polarization information should be interpreted or ignored, and the lookup array of barcodes. Note that the lookup array is searched linearly, a possible bottleneck for large particle arrays. If necessary, the barcode array could be replaced by a hash table.

(Particles: procedures)+≡

```

subroutine particle_init_hepmc (prt, hprt, model, polarization, barcode)
  type(particle_t), intent(out) :: prt
  type(hepmc_particle_t), intent(in) :: hprt

15.4.2 Particle sets

A particle set is what is usually called an event: an array of particles. The individual particle entries carry momentum, quantum numbers, polarization, and optionally connections. There is (also optionally) a correlated state-density matrix that maintains spin correlations that are lost in the individual particle entries.

```

<Particles: public>+≡
    public :: particle_set_t

<Particles: types>+≡
    type :: particle_set_t
        ! private
        integer :: n_beam = 0
        integer :: n_in = 0
        integer :: n_vir = 0
        integer :: n_out = 0
        integer :: n_tot = 0
        type(particle_t), dimension(:), allocatable :: prt
        type(state_matrix_t) :: correlated_state
    end type particle_set_t

```

A particle set can be initialized from an interaction or from a HepMC event record.

```

<Particles: public>+≡
    public :: particle_set_init

```

```

⟨Particles: interfaces⟩+≡
  interface particle_set_init
    module procedure particle_set_init_interaction
    module procedure particle_set_init_hepmc
  end interface

```

When a particle set is initialized from a given interaction, we have to determine the branch within the original state matrix that fixes the particle quantum numbers. This is done with the appropriate probabilities, based on a random number `x`. The `mode` determines whether the individual particles become unpolarized, or take a definite (diagonal) helicity, or acquire single-particle polarization matrices. The flag `keep_correlations` tells whether the spin-correlation matrix is to be calculated and stored in addition to the particles. The flag `keep_virtual` tells whether virtual particles should be dropped. Note that if virtual particles are dropped, the spin-correlation matrix makes no sense, and parent-child relations are not set.

For a correct disentangling of color and flavor (in the presence of helicity), we consider two interactions. `int` has no color information, and is used to select a flavor state. Consequently, we trace over helicities here. `int_flows` contains color-flow and potentially helicity information, but is useful only after the flavor combination has been chosen. So this interaction is used to select helicity and color, but restricted to the selected flavor combination.

`int` and `int_flows` may be identical if there is only a single (or no) color flow. If there is just a single flavor combination, `x(1)` can be set to zero.

The current algorithm of evaluator convolution requires that the beam particles are assumed outgoing (in the beam interaction) and become virtual in all derived interactions. In the particle set they should be re-identified as incoming. The optional integer `n_incoming` can be used to perform this correction.

The flag `is_valid` is false if factorization of the state is not possible, in particular if the squared matrix element is zero.

```

⟨Particles: procedures⟩+≡
  subroutine particle_set_init_interaction &
    (particle_set, is_valid, int, int_flows, mode, x, &
     keep_correlations, keep_virtual, n_incoming)

```

15.4.3 I/O formats

Here, we define input/output of particle sets in various formats. This is the right place since particle sets contain most of the event information.

All write/read routines take as first argument the object, as second argument the I/O unit which in this case is a mandatory argument. Then follow further event data.

Internal binary format

This format is supposed to contain the complete information, so the particle data set can be fully reconstructed. The exception is the model part of the particle flavors; this is unassigned for the flavor values read from file.

NOTE: The input routine for a nontrivial state matrix is broken

```

(Particles: public) +=
  public :: particle_set_write_raw
  public :: particle_set_read_raw

(Particles: procedures) +=
  subroutine particle_set_write_raw (particle_set, u)

end subroutine particle_set_read_raw

```

HepMC format

The master output function fills a HepMC GenEvent object that is already initialized, but has no vertices in it.

We first set up the vertex lists and enter the vertices into the HepMC event. Then, we assign first all incoming particles and then all outgoing particles to their associated vertices. Particles which have neither parent nor children entries (this should not happen) are dropped.

Finally, we insert the beam particles. If there are none, use the incoming particles instead. Transform a particle into a `hepmc_particle` object, including color and polarization. The HepMC status is equivalent to the HEPEVT status, in particular: 0 = null entry, 1 = physical particle, 2 = decayed/fragmented SM hadron, tau or muon, 3 = other unphysical particle entry, 4 = incoming particles, 11 = intermediate resonance such as squarks. The use of 11 for intermediate resonances is as done by HERWIG, see <http://herwig.hepforge.org/trac/wiki/FaQs>.

Transform a particle set into HEPEVT-compatible form. In this form, for each particle, the parents and the children are contiguous in the particle array. Usually, this requires to clone some particles.

We do not know in advance how many particles the canonical form will have. To be on the safe side, allocate four times the original size.

Reconstruct the momenta within an interaction object from a particle set. We start from the incoming particles, which should be stored at the beginning. (The number of incoming particles is provided separately, so we do not need to analyze the interaction or particle set for this.) We follow their children down the tree until the interaction is exhausted.

This implies that the particle set may contain a longer tree (e.g., decay chains) than the interaction. The remainder of the tree is simply ignored.

The detailed ordering of the subsequent sub-interactions may differ between the interaction and the particle set. However, within each sub-interaction, the ordering of particles must match.

It may happen that the particle set lacks beam and remnant particles which are present in the interaction. In this case, the beam particles (the first two entries in the interaction) will not be filled. However, we can use the source link of the beam particles to recover their momenta from the actual beam interaction (which is stored somewhere else), and then recover the beam-remnant momenta as the difference of the beam and parton momenta.

This reconstructs the hard interaction from a particle set. First the particle set is reduced to the incoming partons, then we add the direct children of those. The interaction and particle set should match in their array sizes. If we find a

permutation of the particle flavors that matches one of the given flavor states, the assignment of momenta is made accordingly.

Given a particle set with an arbitrary ordering of particles, we need the permutation that yields an ordering that is present in the state matrix. This can be found by examining the flavor table. The result is a permutation of the PDG array that matches a row in the flavor table. If *ok* is returned false, no match

was found.

```

This procedure reconstructs an array of vertex indices from the parent-child information in the particle entries, according to the HepMC scheme. For each particle, we determine which vertex it comes from and which vertex it goes to. We return the two arrays and the maximum vertex index.

For each particle in the list, we first check its parents. If for any parent the vertex where it goes to is already known, this vertex index is assigned as the current 'from' vertex. Otherwise, a new index is created, assigned as the current 'from' vertex, and as the 'to' vertex for all parents.

Then, the analogous procedure is done for the children.

Chapter 16

Beams

These modules implement beam configuration and beam structure, the latter in abstract terms.

beam_structures The `beam_structure_t` type is a messenger type that communicates the user settings to the **WHIZARD** core.

beams Beam configuration.

sf_aux Tools for handling structure functions and splitting

sf_mappings Mapping functions, useful for structure function implementation

sf_base The abstract structure-function interaction and structure-function chain types.

16.1 Beam structure

This module stores the beam structure definition as it is declared in the SIN-DARIN script. The structure definition is not analyzed, just recorded for later use.

We do not capture any numerical parameters, just names of particles and structure functions.

```
(beam_structures.f90)≡  
  <File header>  
  
  module beam_structures  
  
    <Use kinds>  
    <Use strings>  
    use io_units  
    use format_defs, only: FMT_19  
    use unit_tests  
    use diagnostics  
    use lorentz  
    use polarizations  
  
    <Standard module head>  
  
    <Beam structures: public>  
  
    <Beam structures: types>  
  
    <Beam structures: interfaces>  
  
    contains  
  
    <Beam structures: procedures>  
  
    <Beam structures: tests>  
  
  end module beam_structures
```

16.1.1 Beam structure elements

An entry in a beam-structure record consists of a string that denotes a type of structure function.

```
<Beam structures: types>≡  
  type :: beam_structure_entry_t  
    logical :: is_valid = .false.  
    type(string_t) :: name  
    contains  
    <Beam structures: beam structure entry: TBP>  
  end type beam_structure_entry_t
```

Output.

```
<Beam structures: beam structure entry: TBP>≡  
  procedure :: to_string => beam_structure_entry_to_string
```

```

<Beam structures: procedures>≡
  function beam_structure_entry_to_string (object) result (string)
    class (beam_structure_entry_t), intent(in) :: object
    type(string_t) :: string
    if (object%is_valid) then
      string = object%name
    else
      string = "none"
    end if
  end function beam_structure_entry_to_string

```

A record in the beam-structure sequence denotes either a structure-function entry, a pair of such entries, or a pair spectrum.

```

<Beam structures: types>+≡
  type :: beam_structure_record_t
    type (beam_structure_entry_t), dimension(:), allocatable :: entry
  end type beam_structure_record_t

```

16.1.2 Beam structure type

The beam-structure object contains the beam particle(s) as simple strings. The sequence of records indicates the structure functions by name. No numerical parameters are stored.

```

<Beam structures: public>≡
  public :: beam_structure_t

<Beam structures: types>+≡
  type :: beam_structure_t
    private
    integer :: n_beam = 0
    type(string_t), dimension(:), allocatable :: prt
    type (beam_structure_record_t), dimension(:), allocatable :: record
    type (smatrix_t), dimension(:), allocatable :: smatrix
    real(default), dimension(:), allocatable :: pol_f
    real(default), dimension(:), allocatable :: p
    real(default), dimension(:), allocatable :: theta
    real(default), dimension(:), allocatable :: phi
  contains
    <Beam structures: beam structure: TBP>
  end type beam_structure_t

```

The finalizer deletes all contents explicitly, so we can continue with an empty beam record. (It is not needed for deallocation.) We have distinct finalizers for the independent parts of the beam structure.

```

<Beam structures: beam structure: TBP>≡
  procedure :: final_sf => beam_structure_final_sf

<Beam structures: procedures>+≡
  subroutine beam_structure_final_sf (object)
    class (beam_structure_t), intent(inout) :: object
    if (allocated (object%prt)) deallocate (object%prt)
    if (allocated (object%record)) deallocate (object%record)
  end subroutine beam_structure_final_sf

```

```

    object%n_beam = 0
end subroutine beam_structure_final_sf

```

Output. The actual information fits in a single line, therefore we can provide a `to_string` method. The `show` method also lists the current values of relevant global variables.

```

        string = "[any particles]"
    end select
end function beam_structure_to_string

```

Initializer: dimension the beam structure record. Each array element denotes the number of entries for a record within the beam-structure sequence. The number of entries is either one or two, while the number of records is unlimited.

(Beam structures: beam structure: TBP)+≡

```

    procedure :: init_sf => beam_structure_init_sf

```

(Beam structures: procedures)+≡

```

    subroutine beam_structure_init_sf (beam_structure, prt, dim_array)
        class(beam_structure_t), intent(inout) :: beam_structure
        type(string_t), dimension(:), intent(in) :: prt
        integer, dimension(:), intent(in), optional :: dim_array
        integer :: i
        call beam_structure%final_sf ()
        beam_structure%n_beam = size (prt)
        allocate (beam_structure%prt (size (prt)))
        beam_structure%prt = prt
        if (present (dim_array)) then
            allocate (beam_structure%record (size (dim_array)))
            do i = 1, size (dim_array)
                allocate (beam_structure%record(i)%entry (dim_array(i)))
            end do
        else
            allocate (beam_structure%record (0))
        end if
    end subroutine beam_structure_init_sf

```

Set an entry, specified by record number and entry number.

(Beam structures: beam structure: TBP)+≡

```

    procedure :: set_sf => beam_structure_set_sf

```

```

<Beam structures: procedures>+≡
subroutine beam_structure_set_sf (beam_structure, i, j, name)
  class(beam_structure_t), intent(inout) :: beam_structure
  integer, intent(in) :: i, j
  type(string_t), intent(in) :: name
  associate (entry => beam_structure%record(i)%entry(j))
    entry%name = name
    entry%is_valid = .true.
  end associate
end subroutine beam_structure_set_sf

```

Expand the beam-structure object. (i) For a pair spectrum, keep the entry. (ii) For a single-particle structure function written as a single entry, replace this by a record with two entries. (ii) For a record with two nontrivial entries, separate this into two records with one trivial entry each.

To achieve this, we need a function that tells us whether an entry is a spectrum or a structure function. It returns 0 for a trivial entry, 1 for a single-particle structure function, and 2 for a two-particle spectrum.

```

<Beam structures: interfaces>≡
abstract interface
  function strfun_mode_fun (name) result (n)
  import
  type(string_t), intent(in) :: name
  integer :: n
end function strfun_mode_fun
end interface

```

Algorithm: (1) Mark entries as invalid where necessary. (2) Count the number of entries that we will need. (3) Expand and copy entries to a new record array. (4) Replace the old array by the new one.

```

    end do
  end do

```

```

    call move_alloc (from = new, to = beam_structure%record)
end subroutine beam_structure_expand

```

16.1.3 Polarization

To record polarization, we provide an allocatable array of `smatrix` objects, sparse matrices. The polarization structure is independent of the structure-function setup, they are combined only when an actual beam object is constructed.

```

<Beam structures: beam structure: TBP>+≡
  procedure :: final_pol => beam_structure_final_pol
  procedure :: init_pol => beam_structure_init_pol

<Beam structures: procedures>+≡
  subroutine beam_structure_final_pol (beam_structure)
    class(beam_structure_t), intent(inout) :: beam_structure
    if (allocated (beam_structure%smatrix)) deallocate (beam_structure%smatrix)
    if (allocated (beam_structure%pol_f)) deallocate (beam_structure%pol_f)
  end subroutine beam_structure_final_pol

  subroutine beam_structure_init_pol (beam_structure, n)
    class(beam_structure_t), intent(inout) :: beam_structure
    integer, intent(in) :: n
    if (allocated (beam_structure%smatrix)) deallocate (beam_structure%smatrix)
    allocate (beam_structure%smatrix (n))
    if (.not. allocated (beam_structure%pol_f)) &
      allocate (beam_structure%pol_f (n), source = 1._default)
  end subroutine beam_structure_init_pol

```

Directly copy the spin density matrices.

```

<Beam structures: beam structure: TBP>+≡
  procedure :: set_smatrix => beam_structure_set_smatrix

<Beam structures: procedures>+≡
  subroutine beam_structure_set_smatrix (beam_structure, i, smatrix)
    class(beam_structure_t), intent(inout) :: beam_structure
    integer, intent(in) :: i
    type(smatrix_t), intent(in) :: smatrix
    beam_structure%smatrix(i) = smatrix
  end subroutine beam_structure_set_smatrix

```

Initialize one of the spin density matrices manually.

```

<Beam structures: beam structure: TBP>+≡
  procedure :: init_smatrix => beam_structure_init_smatrix

<Beam structures: procedures>+≡
  subroutine beam_structure_init_smatrix (beam_structure, i, n_entry)
    class(beam_structure_t), intent(inout) :: beam_structure
    integer, intent(in) :: i
    integer, intent(in) :: n_entry
    call beam_structure%smatrix(i)%init (2, n_entry)
  end subroutine beam_structure_init_smatrix

```

Set a polarization entry.

```

<Beam structures: beam structure: TBP>+≡
  procedure :: set_sentry => beam_structure_set_sentry

<Beam structures: procedures>+≡
  subroutine beam_structure_set_sentry &
    (beam_structure, i, i_entry, index, value)
    class(beam_structure_t), intent(inout) :: beam_structure
    integer, intent(in) :: i

16.2.1 Beam data

The beam data type contains beam data for one or two beams, depending on whether we are dealing with beam collisions or particle decay. In addition, it holds the c.m. energy `sqrts`, the Lorentz transformation `L` that transforms the c.m. system into the lab system, and the pair of c.m. momenta.

```
<Beams: public>≡  
  public :: beam_data_t  
  
<Beams: types>≡  
  type :: beam_data_t  
    logical :: initialized = .false.  
    integer :: n = 0
```

```

    type(flavor_t), dimension(:), allocatable :: flv
    real(default), dimension(:), allocatable :: mass
    type(pmatrix_t), dimension(:), allocatable :: pmatrix
    logical :: lab_is_cm_frame = .true.
    type(vector4_t), dimension(:), allocatable :: p_cm
    type(vector4_t), dimension(:), allocatable :: p
    type(lorentz_transformation_t), allocatable :: L_cm_to_lab
    real(default) :: sqrts = 0
    character(32) :: md5sum = ""
contains
  <Beams: beam data: TBP>
end type beam_data_t

```

Generic initializer. This is called by the specific initializers below. Initialize either for decay or for collision.

```

<Beams: procedures>≡

        end if
    case default
        call msg_bug ("Beam data: invalid beam structure object")
    end select
end if
end subroutine beam_data_init_structure

```

16.2.3 Initializers: collisions

This is the simplest one: just the two flavors, c.m. energy, polarization. Color is inferred from flavor. Beam momenta and c.m. momenta coincide.

```

<Beams: public>+≡
    public :: beam_data_init_sqrts

<Beams: procedures>+≡
    subroutine beam_data_init_sqrts (beam_data, sqrts, flv, smatrix, pol_f)
        type (beam_data_t), intent(out) :: beam_data
        real(default), intent(in) :: sqrts
        type(flavor_t), dimension(:), intent(in) :: flv
        type(smatrix_t), dimension(:), intent(in), optional :: smatrix
        real(default), dimension(:), intent(in), optional :: pol_f
        real(default), dimension(size(flv)) :: E, p
        call beam_data_init (beam_data, size (flv))
        beam_data%sqrts = sqrts
        beam_data%lab_is_cm_frame = .true.
        select case (beam_data%n)
        case (1)
            E = sqrts; p = 0
            beam_data%p_cm = vector4_moving (E, p, 3)
            beam_data%p = beam_data%p_cm
        case (2)
            beam_data%p_cm = colliding_momenta (sqrts, flavor_get_mass (flv))
            beam_data%p = colliding_momenta (sqrts, flavor_get_mass (flv))
        end select
    end subroutine

```

```

end select
call beam_data_finish_initialization (beam_data, flv, smatrix, pol_f)
end subroutine beam_data_init_sqrts

```

This version sets beam momenta directly, assuming that they are asymmetric, i.e., lab frame and c.m. frame do not coincide. Polarization info is deferred to a common initializer.

The Lorentz transformation that we compute here is not actually used in the calculation; instead, it will be recomputed for each event in the subroutine `phs_set_incoming_momenta`. We compute it here for the nominal beam setup nevertheless, so we can print it and, in particular, include it in the MD5 sum.

<Beams: public>+≡

```
public :: beam_data_init_momenta
```

<Beams: procedures>+≡

```

subroutine beam_data_init_momenta (beam_data, p3, flv, smatrix, pol_f)

  end if
end do
call beam_data_compute_md5sum (beam_data)
end subroutine beam_data_finish_initialization
```

The MD5 sum is stored within the beam-data record, so it can be checked for integrity in subsequent runs.

(Beams: procedures)+≡

```
subroutine beam_data_compute_md5sum (beam_data)
  type(beam_data_t), intent(inout) :: beam_data
  integer :: unit
  unit = free_unit ()
  open (unit = unit, status = "scratch", action = "readwrite")
  call beam_data_write (beam_data, unit, write_md5sum = .false., &
    verbose = .true.)
  rewind (unit)
  beam_data%md5sum = md5sum (unit)
  close (unit)
end subroutine beam_data_compute_md5sum
```

16.2.4 Initializers: decays

This is the simplest one: decay in rest frame. We need just flavor and polarization. Color is inferred from flavor. Beam momentum and c.m. momentum

coincide.

```
<Beams: public>+≡
    public :: beam_data_init_decay

<Beams: procedures>+≡
    subroutine beam_data_init_decay (beam_data, flv, smatrix, pol_f, rest_frame)
        type(beam_data_t), intent(out) :: beam_data
        type(flavor_t), dimension(1), intent(in) :: flv
        type(smatrix_t), dimension(1), intent(in), optional :: smatrix
        real(default), dimension(:), intent(in), optional :: pol_f
        logical, intent(in), optional :: rest_frame
        real(default), dimension(1) :: m
        m = flavor_get_mass (flv)
        if (present (smatrix)) then
            call beam_data_init_sqrts (beam_data, m(1), flv, smatrix, pol_f)
        else
            call beam_data_init_sqrts (beam_data, m(1), flv, smatrix, pol_f)
        end if
        if (present (rest_frame)) beam_data%lab_is_cm_frame = rest_frame
    end subroutine beam_data_init_decay
```

16.2.5 Sanity check

After the beams have been set, the initial-particle masses may have been modified. This can be checked here.

```
<Beams: public>+≡
    public :: beam_data_masses_are_consistent

<Beams: procedures>+≡
    function beam_data_masses_are_consistent (beam_data) result (flag)
        logical :: flag
        type(beam_data_t), intent(in) :: beam_data
        flag = all (beam_data%mass == flavor_get_mass (beam_data%flv))
    end function beam_data_masses_are_consistent
```

16.2.6 The beams type

Beam objects are interaction objects that contain the actual beam data including polarization and density matrix. For collisions, the beam object actually contains two beams.

```
<Beams: public>+≡
    public :: beam_t

<Beams: types>+≡
    type :: beam_t
        private
        type(interaction_t) :: int
    end type beam_t
```

The constructor contains code that converts beam data into the (entangled) particle-pair quantum state. First, we set the number of particles and polarization mask. (The polarization mask is handed over to all later interactions, so if helicity is diagonal or absent, this fact is used when constructing the hard-interaction events.) Then, we construct the entangled state that combines helicity, flavor and color of the two particles (where flavor and color are unique, while several helicity states are possible). Then, we transfer this state together with the associated values from the spin density matrix into the `interaction_t` object.

```

16.3.1 Momentum splitting

Let us consider first an incoming parton with momentum k and invariant mass squared $s = k^2$ that splits into two partons with momenta q, p and invariant masses $t = q^2$ and $u = p^2$. (This is an abuse of the Mandelstam notation. t is actually the momentum transfer, assuming that p is radiated and q initiates the hard process.) The energy is split among the partons such that if $E = k^0$, we have $q^0 = xE$ and $p^0 = \bar{x}E$, where $\bar{x} \equiv 1 - x$.

We define the angle θ as the polar angle of p w.r.t. the momentum axis of the incoming momentum k . Ignoring azimuthal angle, we can write the four-momenta in the basis (E, p_T, p_L) as

$$k = \begin{pmatrix} E \\ 0 \\ p \end{pmatrix}, \quad p = \begin{pmatrix} \bar{x}E \\ \bar{x}\bar{p}\sin\theta \\ \bar{x}\bar{p}\cos\theta \end{pmatrix}, \quad q = \begin{pmatrix} xE \\ -\bar{x}\bar{p}\sin\theta \\ p - \bar{x}\bar{p}\cos\theta \end{pmatrix}, \quad (16.1)$$

where the first two mass-shell conditions are

$$p^2 = E^2 - s, \quad \bar{p}^2 = E^2 - \frac{u}{\bar{x}^2}. \quad (16.2)$$

The second condition implies that, for positive u , $\bar{x}^2 > u/E^2$, or equivalently

$$x < 1 - \sqrt{u}/E. \quad (16.3)$$

We are interested in the third mass-shell conditions: s and u are fixed, so we need t as a function of $\cos\theta$:

$$t = -2\bar{x}(E^2 - p\bar{p}\cos\theta) + s + u. \quad (16.4)$$

Solving for $\cos\theta$, we get

$$\cos\theta = \frac{2\bar{x}E^2 + t - s - u}{2\bar{x}p\bar{p}}. \quad (16.5)$$

We can compute $\sin^2\theta$ numerically as $\sin^2\theta = 1 - \cos^2\theta$, but it is important to reexpress this in view of numerical stability. To this end, we first determine the bounds for t . The cosine must be between -1 and 1 , so the bounds are

$$t_0 = -2\bar{x}(E^2 + p\bar{p}) + s + u, \quad (16.6)$$

$$t_1 = -2\bar{x}(E^2 - p\bar{p}) + s + u. \quad (16.7)$$

Computing $\sin^2\theta$ from $\cos\theta$ above, we observe that the numerator is a quadratic polynomial in t which has the zeros t_0 and t_1 , while the common denominator is given by $(2\bar{x}p\bar{p})^2$. Hence, we can write

$$\sin^2\theta = -\frac{(t - t_0)(t - t_1)}{(2\bar{x}p\bar{p})^2} \quad \text{and} \quad \cos\theta = \frac{(t - t_0) + (t - t_1)}{4\bar{x}p\bar{p}}, \quad (16.8)$$

which is free of large cancellations near $t = t_0$ or $t = t_1$.

If all is massless, i.e., $s = u = 0$, this simplifies to

$$t_0 = -4\bar{x}E^2, \quad t_1 = 0, \quad (16.9)$$

$$\sin^2\theta = -\frac{t}{\bar{x}E^2} \left(1 + \frac{t}{4\bar{x}E^2}\right), \quad \cos\theta = 1 + \frac{t}{2\bar{x}E^2}. \quad (16.10)$$

Here is the implementation. First, we define a container for the kinematical integration limits and some further data.

```

16.3.2 Constant data

This is the initializer for the data. The input consists of the incoming momentum, its invariant mass squared, and the invariant mass squared of the radiated particle. m_2 is the *physical* mass squared of the outgoing particle. The t bounds depend on the chosen x value and cannot be determined yet.

```

(SF aux: splitting data: TBP)+≡
  procedure :: init => splitting_data_init

(SF aux: procedures)+≡
  subroutine splitting_data_init (d, k, mk2, mr2, mo2, collinear)
    class(splitting_data_t), intent(out) :: d
    type(vector4_t), intent(in) :: k
    real(default), intent(in) :: mk2, mr2, mo2
    logical, intent(in), optional :: collinear
    if (present (collinear)) d%collinear = collinear
    d%E = energy (k)
    d%x1 = 1 - sqrt (max (mr2, 0._default)) / d%E
    d%p = sqrt (d%E**2 - mk2)
    d%s = mk2
    d%u = mr2
    d%m2 = mo2
  end subroutine splitting_data_init

```

Retrieve the x bounds, if needed for x sampling. Generating an x value is done by the caller, since this is the part that depends on the nature of the structure function.

```

(SF aux: splitting data: TBP)+≡
  procedure :: get_x_bounds => splitting_get_x_bounds

(SF aux: procedures)+≡
  function splitting_get_x_bounds (d) result (x)
    class(splitting_data_t), intent(in) :: d
    real(default), dimension(2) :: x
    x = [ d%x0, d%x1 ]
  end function splitting_get_x_bounds

```

Now set the momentum fraction and compute t_0 and t_1 .

[The calculation of t_1 is subject to numerical problems. The exact formula is ($s = m_i^2$, $u = m_r^2$)

$$t_1 = -2\bar{x}E^2 + m_i^2 + m_r^2 + 2\bar{x}\sqrt{E^2 - m_i^2}\sqrt{E^2 - m_r^2/\bar{x}^2}. \quad (16.11)$$

The structure-function paradigm is useful only if $E \gg m_i, m_r$. In a Taylor expansion for large E , the leading term cancels. The expansion of the square roots (to subleading order) yields

$$t_1 = xm_i^2 - \frac{x}{\bar{x}}m_r^2. \quad (16.12)$$

There are two cases of interest: $m_i = m_o$ and $m_r = 0$,

$$t_1 = xm_o^2 \quad (16.13)$$

and $m_i = m_r$ and $m_o = 0$,

$$t_1 = -\frac{x^2}{\bar{x}} m_i^2. \quad (16.14)$$

In both cases, $t_1 \leq m_o^2$.]

That said, it turns out that taking the t_1 evaluation at face value leads to less problems than the approximation. We express the angles in terms of $t - t_0$ and $t - t_1$. Numerical noise in t_1 can then be tolerated.

```

<SF aux: splitting data: TBP>+≡
  procedure :: set_t_bounds => splitting_set_t_bounds

<SF aux: procedures>+≡
  elemental subroutine splitting_set_t_bounds (d, x, xb)
    class(splitting_data_t), intent(inout) :: d
    real(default), intent(in), optional :: x, xb
    real(default) :: tp, tm
    if (present (x)) d%x = x
    if (present (xb)) d%xb = xb
    if (d%xb /= 0) then
      d%pb = sqrt (max (d%E**2 - d%u / d%xb**2, 0._default))
    else
      d%pb = 0
    end if
    tp = -2 * d%xb * d%E**2 + d%s + d%u
    tm = -2 * d%xb * d%p * d%pb
    d%t0 = tp + tm
    d%t1 = tp - tm
    d%t = d%t1
  end subroutine splitting_set_t_bounds

```

16.3.3 Sampling recoil

Compute a value for the momentum transfer t , using a random number r . We assume a logarithmic distribution for $t - m^2$, corresponding to the propagator $1/(t - m^2)$ with the physical mass m for the outgoing particle. Optionally, we can narrow the kinematical bounds.

If all three masses in the splitting vanish, the upper limit for t is zero. In that case, the t value is set to zero and the splitting will be collinear.

```

<SF aux: splitting data: TBP>+≡
  procedure :: sample_t => splitting_sample_t

<SF aux: procedures>+≡
  subroutine splitting_sample_t (d, r, t0, t1)
    class(splitting_data_t), intent(inout) :: d
    real(default), intent(in) :: r
    real(default), intent(in), optional :: t0, t1
    real(default) :: tt0, tt1, tt0m, tt1m
    if (d%collinear) then
      d%t = d%t1
    else
      tt0 = d%t0; if (present (t0)) tt0 = max (t0, tt0)
      tt1 = d%t1; if (present (t1)) tt1 = min (t1, tt1)
      tt0m = tt0 - d%m2

```

```

        tt1m = tt1 - d%m2
        if (tt0m < 0 .and. tt1m < 0 .and. abs(tt0m) > &
            epsilon(tt0m) .and. abs(tt1m) > epsilon(tt0m)) then
            d%t = d%m2 + tt0m * exp (r * log (tt1m / tt0m))
        else
            d%t = tt1
        end if
    end if
end subroutine splitting_sample_t

```

The inverse operation: Given t , we recover the value of r that would have produced this value.

```

<SF aux: splitting data: TBP>+≡
    procedure :: inverse_t => splitting_inverse_t
<SF aux: procedures>+≡
    subroutine splitting_inverse_t (d, r, t0, t1)
        class(splitting_data_t), intent(in) :: d
        real(default), intent(out) :: r
        real(default), intent(in), optional :: t0, t1
        real(default) :: tt0, tt1, tt0m, tt1m
        if (d%collinear) then
            r = 0
        else
            tt0 = d%t0; if (present (t0)) tt0 = max (t0, tt0)
            tt1 = d%t1; if (present (t1)) tt1 = min (t1, tt1)
            tt0m = tt0 - d%m2
            tt1m = tt1 - d%m2
            if (tt0m < 0 .and. tt1m < 0) then
                r = log ((d%t - d%m2) / tt0m) / log (tt1m / tt0m)
            else
                r = 0
            end if
        end if
    end subroutine splitting_inverse_t

```

This is trivial, but provided for convenience:

```

<SF aux: splitting data: TBP>+≡
    procedure :: sample_phi => splitting_sample_phi
<SF aux: procedures>+≡
    subroutine splitting_sample_phi (d, r)
        class(splitting_data_t), intent(inout) :: d
        real(default), intent(in) :: r
        if (d%collinear) then
            d%phi = 0
        else
            d%phi = (1-r) * d%phi0 + r * d%phi1
        end if
    end subroutine splitting_sample_phi

```

Inverse:

```

<SF aux: splitting data: TBP>+≡
    procedure :: inverse_phi => splitting_inverse_phi

```

```

<SF aux: procedures>+≡
subroutine splitting_inverse_phi (d, r)
  class(splitting_data_t), intent(in) :: d
  real(default), intent(out) :: r
  if (d%collinear) then
    r = 0
  else
    r = (d%phi - d%phi0) / (d%phi1 - d%phi0)
  end if
end subroutine splitting_inverse_phi

```

16.3.4 Splitting

In this function, we actually perform the splitting. The incoming momentum k is split into (if no recoil) $q_1 = (1 - x)k$ and $q_2 = xk$.

Apart from the splitting data, we need the incoming momentum k , the momentum transfer t , and the azimuthal angle ϕ . The momentum fraction x is already known here.

Alternatively, we can split without recoil. The azimuthal angle is irrelevant, and the momentum transfer is always equal to the upper limit t_1 , so the polar angle is zero. Obviously, if there are nonzero masses it is not possible to keep both energy-momentum conservation and at the same time all particles on shell. We choose for dropping the on-shell condition here.

```

<SF aux: splitting data: TBP>+≡
procedure :: split_momentum => splitting_split_momentum

<SF aux: procedures>+≡
function splitting_split_momentum (d, k) result (q)
  class(splitting_data_t), intent(in) :: d
  type(vector4_t), dimension(2) :: q
  type(vector4_t), intent(in) :: k
  real(default) :: st2, ct2, st, ct, cp, sp
  type(lorentz_transformation_t) :: rot
  real(default) :: tt0, tt1, den
  type(vector3_t) :: kk, q1, q2
  if (d%collinear) then
    if (d%s == 0 .and. d%u == 0) then
      q(1) = d%xb * k
      q(2) = d%x * k
    else
      kk = space_part (k)
      q1 = d%xb * (d%pb / d%p) * kk
      q2 = kk - q1
      q(1) = vector4_moving (d%xb * d%E, q1)
      q(2) = vector4_moving (d%x * d%E, q2)
    end if
  else
    den = 2 * d%xb * d%p * d%pb
    tt0 = max (d%t - d%t0, 0._default)
    tt1 = min (d%t - d%t1, 0._default)
    if (den**2 <= epsilon(den)) then
      st2 = 1
    end if
  end if
end function splitting_split_momentum

```

```

else
  st2 = - (tt0 * tt1) / den ** 2
end if
if (st2 > 1) then
  st2 = 1
end if
ct2 = 1 - st2
st = sqrt (max (st2, 0._default))
ct = sqrt (max (ct2, 0._default))
sp = sin (d%phi)
cp = cos (d%phi)
rot = rotation_to_2nd (3, space_part (k))
q1 = vector3_moving (d%xb * d%pb * [st * cp, st * sp, ct])
q2 = vector3_moving (d%p, 3) - q1
q(1) = rot * vector4_moving (d%xb * d%E, q1)
q(2) = rot * vector4_moving (d%x * d%E, q2)
end if
end function splitting_split_momentum

```

Momenta generated by splitting will in general be off-shell. They are on-shell only if they are collinear and massless. This subroutine puts them on shell by brute force, violating either momentum or energy conservation. The direction of three-momentum is always retained.

If the energy is below mass shell, we return a zero momentum.

```

<SF aux: parameters>≡
  integer, parameter, public :: KEEP_ENERGY = 0, KEEP_MOMENTUM = 1

<SF aux: public>+≡
  public :: on_shell

<SF aux: procedures>+≡
  elemental subroutine on_shell (p, m2, keep)
    type(vector4_t), intent(inout) :: p
    real(default), intent(in) :: m2
    integer, intent(in) :: keep
    real(default) :: E, E2, pn
    select case (keep)
    case (KEEP_ENERGY)
      E = energy (p)
      E2 = E ** 2
      if (E2 >= m2) then
        pn = sqrt (E2 - m2)
        p = vector4_moving (E, pn * direction (space_part (p)))
      else
        p = vector4_null
      end if
    case (KEEP_MOMENTUM)
      E = sqrt (space_part (p) ** 2 + m2)
      p = vector4_moving (E, space_part (p))
    end select
  end subroutine on_shell

```

16.3.5 Recovering the splitting

This is the inverse problem. We have on-shell momenta and want to deduce the splitting parameters x , t , and ϕ .

```

(SF aux: splitting data: TBP)+≡
  procedure :: recover => splitting_recover

(SF aux: procedures)+≡

      else
        d%phi = 0
      end if
    end if
  end subroutine splitting_recover

```

16.3.6 Extract data

```

<SF aux: splitting data: TBP>+≡
  procedure :: get_x => splitting_get_x

<SF aux: procedures>+≡
  function splitting_get_x (sd) result (x)
    class(splitting_data_t), intent(in) :: sd
    real(default) :: x
    x = sd%x
  end function splitting_get_x

```

16.3.7 Unit tests

```

<SF aux: public>+≡
  public :: sf_aux_test

<SF aux: tests>≡
  subroutine sf_aux_test (u, results)
    integer, intent(in) :: u
    type(test_results_t), intent(inout) :: results
  <SF aux: execute tests>
  end subroutine sf_aux_test

```

Momentum splitting: massless radiation

Compute momentum splitting for generic kinematics. It turns out that for $x = 0.5$, where $t - m^2$ is the geometric mean between its upper and lower bounds (this can be directly seen from the logarithmic distribution in the function `sample_t` for $r \equiv x = 1 - x = 0.5$), we arrive at an exact number $t = -0.15$ for the given input values.

```

<SF aux: execute tests>≡

```

```

Momentum splitting: massless parton

Compute momentum splitting for generic kinematics. It turns out that for $x = 0.5$, where $t - m^2$ is the geometric mean between its upper and lower bounds, we arrive at an exact number $t = -0.36$ for the given input values.

```

16.4 Mappings for structure functions

In this module, we provide a wrapper for useful mappings of the unit (hyper-)square that we can apply to a set of structure functions.

In some cases it is useful, or even mandatory, to map the MC input parameters nontrivially onto a set of structure functions for the two beams. In all cases considered here, instead of x_1, x_2, \dots as parameters for the beams, we generate one parameter that is equal, or related to, the product $x_1 x_2 \dots$ (so it directly corresponds to \sqrt{s}). The other parameters describe the distribution of energy (loss) between beams and radiations.

```
<sf_mappings.f90>≡  
  <File header>  
  
  module sf_mappings  
  
    <Use kinds>  
    use kinds, only: double  
    use io_units  
    use constants, only: pi  
    use format_defs, only: FMT_12, FMT_13, FMT_14, FMT_15, FMT_16  
    use unit_tests  
    use diagnostics  
  
    <Standard module head>  
  
    <SF mappings: public>  
  
    <SF mappings: parameters>  
  
    <SF mappings: types>  
  
    <SF mappings: interfaces>  
  
    contains  
  
    <SF mappings: procedures>  
  
    <SF mappings: tests>  
  
  end module sf_mappings
```

16.4.1 Base type

First, we define an abstract base type for the mapping. In all cases we need to store the indices of the parameters on which the mapping applies. Additional parameters can be stored in the extensions of this type.

```
<SF mappings: public>≡  
  public :: sf_mapping_t  
  
<SF mappings: types>≡  
  type, abstract :: sf_mapping_t  
    integer, dimension(:), allocatable :: i  
  contains
```

```

    <SF mappings: sf mapping: TBP>
end type sf_mapping_t

```

The output routine is deferred:

```

<SF mappings: sf mapping: TBP>≡
    procedure (sf_mapping_write), deferred :: write

<SF mappings: interfaces>≡
    abstract interface
        subroutine sf_mapping_write (object, unit)
            import
            class(sf_mapping_t), intent(in) :: object
            integer, intent(in), optional :: unit
        end subroutine sf_mapping_write
    end interface

```

Initializer for the base type. The array of parameter indices is allocated but initialized to zero.

```

<SF mappings: sf mapping: TBP>+≡
    procedure :: base_init => sf_mapping_base_init

<SF mappings: procedures>≡
    subroutine sf_mapping_base_init (mapping, n_par)
        class(sf_mapping_t), intent(out) :: mapping
        integer, intent(in) :: n_par
        allocate (mapping%i (n_par))
        mapping%i = 0
    end subroutine sf_mapping_base_init

```

Set an index value.

```

<SF mappings: sf mapping: TBP>+≡
    procedure :: set_index => sf_mapping_set_index

<SF mappings: procedures>+≡
    subroutine sf_mapping_set_index (mapping, j, i)
        class(sf_mapping_t), intent(inout) :: mapping
        integer, intent(in) :: j, i
        mapping%i(j) = i
    end subroutine sf_mapping_set_index

```

Return the dimensionality, i.e., the number of parameters.

```

<SF mappings: sf mapping: TBP>+≡
    procedure :: get_n_dim => sf_mapping_get_n_dim

<SF mappings: procedures>+≡
    function sf_mapping_get_n_dim (mapping) result (n)
        class(sf_mapping_t), intent(in) :: mapping
        integer :: n
        n = size (mapping%i)
    end function sf_mapping_get_n_dim

```

Computation: the values **p** are the input parameters, the values **r** are the output parameters. The values **rb** are defined as $\bar{r} = 1 - r$, but provided explicitly. They allow us to avoid numerical problems near $r = 1$.

The extra parameter **x_free** indicates that the total energy has already been renormalized by this factor. We have to take such a factor into account in a resonance or on-shell mapping.

The Jacobian is **f**. We modify only the two parameters indicated by the indices **i**.

```

<SF mappings: sf mapping: TBP>+≡
  procedure (sf_mapping_compute), deferred :: compute

<SF mappings: interfaces>+≡
  abstract interface
    subroutine sf_mapping_compute (mapping, r, rb, f, p, pb, x_free)
      import
      class(sf_mapping_t), intent(inout) :: mapping
      real(default), dimension(:), intent(out) :: r, rb
      real(default), intent(out) :: f
      real(default), dimension(:), intent(in) :: p, pb
      real(default), intent(inout), optional :: x_free
    end subroutine sf_mapping_compute
  end interface

```

The inverse mapping. Use **r** and/or **rb** to reconstruct **p** and also compute **f**.

```

<SF mappings: sf mapping: TBP>+≡
  procedure (sf_mapping_inverse), deferred :: inverse

<SF mappings: interfaces>+≡
  abstract interface
    subroutine sf_mapping_inverse (mapping, r, rb, f, p, pb, x_free)
      import
      class(sf_mapping_t), intent(inout) :: mapping
      real(default), dimension(:), intent(in) :: r, rb
      real(default), intent(out) :: f
      real(default), dimension(:), intent(out) :: p, pb
      real(default), intent(inout), optional :: x_free
    end subroutine sf_mapping_inverse
  end interface

```

16.4.2 Methods for self-tests

This is a shorthand for: inject parameters, compute the mapping, display results, compute the inverse, display again. We provide an output format for the parameters and, optionally, a different output format for the Jacobians.

```

<SF mappings: sf mapping: TBP>+≡
  procedure :: check => sf_mapping_check

<SF mappings: procedures>+≡
  subroutine sf_mapping_check (mapping, u, p_in, pb_in, fmt_p, fmt_f)
    class(sf_mapping_t), intent(inout) :: mapping
    integer, intent(in) :: u
    real(default), dimension(:), intent(in) :: p_in, pb_in

```

```

character(*), intent(in) :: fmt_p
character(*), intent(in), optional :: fmt_f
real(default), dimension(size(p_in)) :: p, pb, r, rb
real(default) :: f, tolerance
tolerance = 1.5E-17
p = p_in
pb= pb_in
call mapping%compute (r, rb, f, p, pb)
call pacify (p, tolerance)
call pacify (pb, tolerance)
call pacify (r, tolerance)
call pacify (rb, tolerance)
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "p =", p
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "pb=", pb
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "r =", r
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "rb=", rb
if (present (fmt_f)) then
  write (u, "(3x,A,9(1x," // fmt_f // "))" ) "f =", f
else
  write (u, "(3x,A,9(1x," // fmt_p // "))" ) "f =", f
end if
write (u, *)
call mapping%inverse (r, rb, f, p, pb)
call pacify (p, tolerance)
call pacify (pb, tolerance)
call pacify (r, tolerance)
call pacify (rb, tolerance)
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "p =", p
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "pb=", pb
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "r =", r
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "rb=", rb
if (present (fmt_f)) then
  write (u, "(3x,A,9(1x," // fmt_f // "))" ) "f =", f
else
  write (u, "(3x,A,9(1x," // fmt_p // "))" ) "f =", f
end if
write (u, *)
write (u, "(3x,A,9(1x," // fmt_p // "))" ) "*r=", product (r)
end subroutine sf_mapping_check

```

This is a consistency check for the self-tests: the integral over the unit square should be unity. We estimate this by a simple binning and adding up the values; this should be sufficient for a self-test.

The argument is the requested number of sampling points. We take the square root for binning in both dimensions, so the precise number might be different.

```

<SF mappings: sf mapping: TBP>+≡
  procedure :: integral => sf_mapping_integral

<SF mappings: procedures>+≡
function sf_mapping_integral (mapping, n_calls) result (integral)
  class(sf_mapping_t), intent(inout) :: mapping
  integer, intent(in) :: n_calls

    f = fbw * f2
  end subroutine sf_res_mapping_inverse

```

16.4.5 Implementation: on-shell mapping

This is a degenerate version of the unit-square mapping where the product $r_1 r_2$ is constant. This product is given by the rescaled squared mass. We introduce an artificial first parameter p_1 to keep the counting, but nothing depends on it. The second parameter is the same p_2 as for the standard unit-square mapping for $\alpha = 1$, it parameterizes the ratio of r_1 and r_2 .

```

<SF mappings: public>+≡
  public :: sf_os_mapping_t

<SF mappings: types>+≡
  type, extends (sf_mapping_t) :: sf_os_mapping_t
    real(default) :: m = 0
    real(default) :: lm2 = 0
  contains
    <SF mappings: sf on-shell mapping: TBP>
  end type sf_os_mapping_t

```

Output.

```

<SF mappings: sf on-shell mapping: TBP>≡
  procedure :: write => sf_os_mapping_write

<SF mappings: procedures>+≡
  subroutine sf_os_mapping_write (object, unit)
    class(sf_os_mapping_t), intent(in) :: object
    integer, intent(in), optional :: unit

p = r
pb= rb
p (mapping%i(1)) = p2(1)
pb(mapping%i(1)) = 1 - p2(1)
p (mapping%i(2)) = p2(2)
pb(mapping%i(2)) = 1 - p2(2)
end subroutine sf_os_mapping_inverse

```

16.4.6 Implementation: endpoint mapping

This maps the unit square (r_1, r_2) such that p_1 is the product $r_1 r_2$, while p_2 is related to the ratio. Furthermore, we enhance the region at $r_1 = 1$ and $r_2 = 1$, which translates into $p_1 = 1$ and $p_2 = 0, 1$. The enhancement is such that any power-like singularity is caught. This is useful for beamstrahlung spectra.

In addition, we allow for a delta-function singularity in r_1 and/or r_2 . The singularity is smeared to an interval of width ϵ . If nonzero, we distinguish the kinematical momentum fractions r_i from effective values x_i , which should go into the structure-function evaluation. A bin of width ϵ in r is mapped to $x = 1$ exactly, while the interval $(0, 1 - \epsilon)$ is mapped to $(0, 1)$ in x . The Jacobian reflects this distinction, and the logical `in_peak` allows for an unambiguous distinction.

The delta-peak fraction is used only for the integration self-test.

```

<SF mappings: public>+≡
  public :: sf_ep_mapping_t

<SF mappings: types>+≡
  type, extends (sf_mapping_t) :: sf_ep_mapping_t
    real(default) :: a = 1
  contains
    <SF mappings: sf endpoint mapping: TBP>
  end type sf_ep_mapping_t

```

Output.

```

<SF mappings: sf endpoint mapping: TBP>≡
  procedure :: write => sf_ep_mapping_write

<SF mappings: procedures>+≡
  subroutine sf_ep_mapping_write (object, unit)
    class(sf_ep_mapping_t), intent(in) :: object
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit)
    write (u, "(1x,A)", advance="no") "map"
    if (any (object%i /= 0)) then
      write (u, "('(',I0,',',I0,')')", advance="no") object%i
    end if
    write (u, "(A,ES12.5,A)") ": endpoint (a =", object%a, ")"
  end subroutine sf_ep_mapping_write

```

Initialize: no extra parameters.

```
<SF mappings: sf endpoint mapping: TBP>+≡  
  procedure :: init => sf_ep_mapping_init  
  
<SF mappings: procedures>+≡  
  subroutine sf_ep_mapping_init (mapping, a)  
    class(sf_ep_mapping_t), intent(out) :: mapping  
    real(default), intent(in), optional :: a  
    call mapping%base_init (2)  
    if (present (a)) mapping%a = a  
  end subroutine sf_ep_mapping_init
```

Apply mapping.

```
<SF mappings: sf endpoint mapping: TBP>+≡  
  procedure :: compute => sf_ep_mapping_compute  
  
<SF mappings: procedures>+≡  
  subroutine sf_ep_mapping_compute (mapping, r, rb, f, p, pb, x_free)

    pb= rb
    do j = 1, 2
        p (mapping%i(j)) = p2(j)
        pb(mapping%i(j)) = 1 - p2(j)
    end do
end subroutine sf_ep_mapping_inverse

```

16.4.7 Implementation: endpoint mapping with resonance

Like the endpoint mapping for p_2 , but replace the endpoint mapping by a Breit-Wigner mapping for p_1 . This covers resonance production in the presence of beamstrahlung.

If the flag `resonance` is unset, we skip the resonance mapping, so the parameter p_1 remains equal to $r_1 r_2$, as in the standard s-channel mapping.

```

<SF mappings: public>+≡
    public :: sf_epr_mapping_t

<SF mappings: types>+≡
    type, extends (sf_mapping_t) :: sf_epr_mapping_t
        real(default) :: a = 1
        real(default) :: m = 0
        real(default) :: w = 0
        logical :: resonance = .true.
    contains
    <SF mappings: sf endpoint/res mapping: TBP>
    end type sf_epr_mapping_t

```

Output.

```

<SF mappings: sf endpoint/res mapping: TBP>≡
    procedure :: write => sf_epr_mapping_write
